SUCCESS TELLS ITS OWN STORY

I had almost despaired of success in the A S Examination before I joined the areers Institute. They made things so easy d to the point that I was quite at home th question papers To my surprise many the questions they had discussed had ppeared Within a month I was so well quipped that I got very high qualifying arks in the Examination I regret I did ot join it earlier *S Khosla M A*
Dehra Dun.

Before I joined your Institute, I was not eeling on sure grounds. But now the things re different. The wavering mind which ad been troubling me so much is no more uch I am confident of success in the Examination Your Model Guess Papers ecently received are a boon to student ommunity The papers are so important nd exquisitely solved that not a single examinee can miss these *T Jalani*
Muradabad

In the I A S Examination I found com pulsory papers most tricky and illusive. The General Knowledge papers were the grave yard of many a brilliant candidate But I am glad to inform you that your "Guess Papers in the Compulsory ,subjects more then justi fied my faith in your Institute and I have secured more marks than I otherwise would have done *S Subramanian*
Madras

' In a Competitive Examination if candidates could just get a couple of marks more than they would otherwise without going through your guesses, they should think their money invested amply rewarded.

"Last year I bought your Guess Papers in the Compulsory Subjects and Economics and did my papers very satisfactorily 'S *Sinha.*
Patna

Careers make possible, the impossible A huge portion that was baffling me was put by them in a nut shell that I could remember all the relevant points easily They give only what is necessary for the Examination. They have a knack of doing it Careers is a sure way to success
J Joseph B A
Bangalore.

Your Guess Papers, Instructions and Model Solutions are marvellous All the topics in Compulsory Subjects as well as Optionals are wouderfully dealt with Please enrol me for the Refrasher Course and start tuition immediately I have already remitted my fe telegraphically
M Patil
Poona

I was introduced to the Careers Institute by one of their old students I was, at first, not very hopeful of what they could do for me. But within a fortnight I came to realize that if I had not taken the Careers & Coures I would have missed the only way to success in Examination They do things so well
Krishnamoorthy M A
Madras

I was hesitant to purchase your Guess Papers for the I A. S September Examination but on the pursuassion of a friend of mine who was your student, I purchased these. Really these papers with model solutions are their money s worth Now I feel confident of taking the Examination successfully I wish I could join your institution for Postal tution earlier
B Mokerjee
Calcutta

While purchasing your Guess Papers I was gambling with my money But on reading the papers and instructions along with model solutions I found these are of immense value to the intending I. A S Examinees
Sohan Singh.
Hoshiarpur

Last year I purchased your Guess Papers in Politics just a fortnight before the examination I should have been stisfied by improving my position by a few more marks. But I am glad to inform you that I secured 65% marks by depending only on your Guess Papers Thus my gamble with money was more than rewarded to my entire satisfaction

EDITORIAL

1957 IN RETROSPECT

The year 1957 which dawned with inter national bitterness over Suez Canal and Hungarian issues, has ended with a new ray of hope for lessening tension between the big Western and Communist blocs During this year the world made very little progress to wards peace the major political problems still remain unsolved Middle East is still the cockpit of power politics Algerians are still fighting for their independence Cypriots have achieved little progress in their struggle for self determination Kashmir problem is still hanging fire in the Security Council South Africa is adamant on its apartheid policy and the Indonesians have taken astounding steps to liberate West New Guinea from Dutch domination There have been minor troubles in some countries but they had little impact on international politics The nuclear armament race is still hotly pur sued and the U N sponsored Disarmament Committee has ended in fiasco without coming to any agreement Britain has joined the hydrogen bomb club and France has announced to produce its own H bomb very soon Russia has stolen a march over other nations in the field of science and nuclear weapon production.

America has lost some international prestige by the spectacle presented by its govern ment since the launching of the first Russian Sputnik by its highly publicised failure to throw a baby moon in an orbit round the world and by racial riots and negro-baiting at Little Rock and Chicago There have been anti American riots in Taipeh and anti American demonstrations in Tokyo

In Russia, Khrushchev has become all powerful by eliminating or demoting his collegues who did not agree with his policy There have been drastic changes in Soviet Presidium and some high ranking communist leaders, including Malenkov, Molotov, Shepilov and Kaganovich were dismissed from Party leadership Lately Marshal Zhukov has been replaced as Soviet Defence Minister by Marshal Malinovsky Thus the pro-Khrushchev group has seized power in Russia and Khrushchev who once vigorously denounced Stalin is actively following Stalin s policy Intoxicated by his own position of strength in Russia and backed by the perfection of nuclear weapons he had declared that Russia could rain bombs on any part of the world While talking loudly on the immediate necessity of coexistence peace and ban on nuclear weapons Russia successfully tested Inter Continental Basilistic Missile which could drop nuclear bombs on pinpointed targets at a distance of 1500 miles

The Middle East

The Middle East Arab countries have been struggling to maintain their independence and neutrality While there has been peace among Israel and Arab nations there has been inter ference by big powers in domestic affairs of these countries and there has also been inter-nal conflicts and dissentions amongst the Arab nations themselves The Eisenhower Doctrine

s an open invitation to Russia to take in est and use its influence in the goverments Arab countries On March 9 Eisenohwer ned the document which gave him power send military aid to any Arab country which ed for it Though the aid was meant inst spread of international communism in guise it was a plea to interfere in the inter l affairs of Arab countries Mr Eisenhower it his emissary, Mr James Richard to tour Middle East countries in search for seekers American aid. Mr Richard s mission to Middle East was a failure and the Arab ders unanimously rejected Mr Eisenhower's wer vacuum in the Middle East theory but ift had been created in the solidarity of ab Nations Saudi Arabia allowed America keep its military base in the country and dan became more inclined towards America accepting economic aid from her On April , King Hussain of Jordan procalaimed rtial law throughout his kingdom and ssolved all political parties after a severe binet crisis The King also rejected diplo- tic ties with Russia America declared its adiness to give military aid to Jordan but ssia warned against any kind of interference Jordan Thus the crisis was averted for the ne being Syria and Egypt stood together d adhered to their policy of positive neutra y Egypt and Syria denounced Jordan for pro western inclination and they declined give financial aid to Jordan until the latter anged its policy There was a radio and ess propaganda in Cairo and Amman nouncing the policy and attitude of each ner Early in June Jordan banned all yptian papers in any language and expelled yptian diplomats from the country By the terference of Saudi Arabia lull has been eated in the press and radio propaganda war t there is still little hope for betterment of lations between Jordan and Egypt in the ar future The Eisenhower Doctrine has rved its ultimate purpose of dividing the ab nations and creating a ' vacuum for estern Powers to step in at the right oment

Britain has also had its share in interfering the Middle East Early in January British rces renewed aggression against Yemen on e pretext of protecting Aden territory from emeni raids The Imam of Yemen claims den as a territory belonging to him while the itish claim Aden as their own protectorate ately there have been direct talks in London tween the British Prime Minister and the Corwn prince to settle the issue but is not yielding to the Yemini claim nor is willing to leave Aden a stronghold of her influence in the Middle East

The British R A F also dropped bombs on Oman in July when the Imam of Oman revolted against the Sultan of Muscat The revolt was subdued by the active military help of the British forces after a three week local war

France has been fighting its own war in Algeria and chasing the Algerian rebels within the borders of Tunisia Tunisia on July 25 had proclaimed itself a republic by deposing the Bey and electing Habib Bour guiba as its first president Tunisia had bought armaments from Britain and America, for defence against French incursions on her territory France had protested to Britain and U S A against providing war weapons to Tunisia and alleged that the weapons were supplied to Algerian rebels by Tunisia Britain and America ignored the protests of France and justified themselves for selling armaments to a sovereign nation for her self defence Tunisia had openly declared its sympathy with the Algerian struggle for independence but had denied any military aid to the freedom fighters The U N Assembly has done nothing to solve the Algerian problem except passing a mild resolution suggesting direct talks between Algerians and the French The French Govern ment claim Algeria as a part of France as in Northern region of Algeria the French popula tion is in majority There has been little progress in solution of the Algerian problem and there seems to be no hope for its solution in the near future until the U N Assembly takes some active interest in it or France sub- mits to the right of self determination of the Algerians On October 1, the four month old French Government headed by M. Maurice Bourges Maunoury fell on the Algerian issue A new government France s twenty fourth after the end of World War II, was formed by M Felix Gaillard on Novem ber 6 In its policy declaration the new government has also not shifted its stand on the Algerian issue

Early in October, Middle East again became an area where a major war could flare up Provoked by Western powers Turkey deployed her armed forces on Turco Syrian border and carried on provocative acts against Syria There was a Western sponsored fuss over trade pact between Syria and Russia Egypt sent her armed forces to Syria A state of emergency was declared by the Syrian army Turkey is a member of NATO and Baghdad Pacts Turkey accused

Syria of piling Russian arms on her borders with a view to attack Turkey The armies of both countries were standing ready for attack On October 18 Russia warned that it would come to Syria s aid if she was attacked This warning made the Western attempt to create trouble in the Middle East fizzle out The result is that Russia again scored a moral victory winning the sympathy of Arab nations

Year of Science

The year 1957, which began and ended in uncertainty and universal indecision has also some remarkable achievements to its credit In this year two new independent nations were born Ghana (Gold Coast) achieved her independence on March 6 while on August 31 Malay declared her independence Both the nations remained in the Commonwealth President Nasser inaugurated new Egyptian National Assembly in Cairo on July 22 thus starting Parliamentary Government in Egypt

The year 1957 will go down into history as a year of science On July 1, ten thousand scientists of 65 nations began to study the secrets of nature If not in political sphere the nations of opposite and different political ideologies joined in a common scientific aim to probe into secrets of nature, under the sea on the land and in the sky The combined study and efforts of these scientists during the International Geophysical Year (July 1 1957 to December 31 1958) will greatly enrich the knowledge of humanity

On October 4 Russia launched her first man made earth satellite This success of Russian scientists astounded the world Again on November 3, Russia launched another satellite with a living dog in it First step on the road towards interplanetary travel has been taken and it is now a matter of only some years when Man will set his foot on Moon, our nearest neighbour in the universe

India

The year 1957 is a memorable one for India On February 25 India went to polls to elect governments for the centre as well as its thirteen states The Congress was again voted to power in the centre and twelve other states Communists formed a government in Kerala This is the first democratic elected communist government in the world Kashmir voted National Conference to power and Bakshi Ghulam Mohd again headed the new cabinet Yuvraj Kiran Singh was elected Sadri Riyasat for another term President Rajinder Prashad and Vice-President S Radhakrishnan were re-elected to their offices

India celebrated the first centenary of its first war of independence with due eclat Decimal coinage was introduced from April 1 India was the host to International Red Cross Conference and the World Religions Conference Many dignitaries including Prime Ministers of Japan Ceylon and Burma, visited India President Kuwatly of Syria and President Ngo Dinh Diem of South Vietnam also paid a visit to India

Kashmir issue has been entangled in Power politics Instead of naming Pakistan as an aggressor in Kashmir the Security Council has tried to make Pakistan the aggrieved party Early this year Mr Gunnar Jarring was sent by the Security Council and now Dr Graham has been asked to visit India and Pakistan in search of settlement of Kashmir problem India has made it clear that the only solution of the problem is vacation by Pakistan of the occupied territory of Kashmir which is an integral part of India Pakistan, which has changed seven governments during the past ten years and has been unable to hold elections even once during this period, wants to keep the Kashmir issue alive to dupe its people Whenever a government staggers in Pakistan its leaders unleash a propaganda of hatred against India and incite the people to fight a holy war for Kashmir In January effigies of Pandit Nehru and other Indian leaders were burnt in Lahore, Karachi Hydrabad and Dacca Though India wants to live in peace and friendship with her neighbour there is no hope of friendly relations between the two countries until Pakistan changes her attitude towards India

In technical, economic and industrial spheres India has made a considerable progress Though the second Five Year Plan is gasping for financial breath yet India is determined to carry on with the task of successfully completing the plan Russia, Japan and West Germany have agreed to give financial credit and technical aid to India Food production has slowed down but it is expected to catch up with the target very soon

In the international sphere, India has gained much prestige and honour New Delhi has become the fifth capital of the world (The other four are Washington London Moscow and Peking) India s neutral policy of non alignment has won her many friends Her foreign policy based on five principles of Panchshila has been emulated by many countries India s opinion and attitude on international problems is respected and her help is constantly sought in solving international problems

sarmament and Cold War

The problem of disarmament and stoppage production of nuclear weapons and their its has remained unsolved Rather the mament race was pursued with vengeance the big Powers

The armament race has resulted in intensi ng the cold war Attempts have been made lessen the tension and mutual distrust but no avail On November 28 Pandit Nehru pealed to leaders of USSR and USA save humanity from disaster that faced on account of competition in weapons mass destruction and cold war Early December Mr N A Bulganin, Chair an of the USSR Council of Ministers, addres d a note to the Governments of United ations member countries and heads of the overnments of Britain USA, France and ederal Republic of Germany proposing to e leaders of the Western states to exchange pinions in detail and sincerely on the fate universal peace and security The Western owers do not agree to any Summit Conference ith the Russians until they 'catch up in uclear weapons production and their per ction This attitude of the Western coun ies cannot but evoke anxiety among the vers of peace The more so, as the war reparations of the Western Powers are ac ompanied by attempts to artificially create n atmosphere of fear and suspicion as to an lleged threat created by communist Russia ven the launching of the earth satellite as created some kind of 'danger to the Vestern countries The Soviet Union has vowed a number of times that it has no ntention of attacking any country and it has dvocated peaceful co existence and mutual egotiations for solving international problems imilarly Mr Eisenhower has declared that America will not go to war except in self lefence if attacked If war is not the aim hen why more deadly atomic weapons are being produced and tested? The reason is mutual distrust and fear Until the cold war s ended there is little hope for peace and essening of tension

Signs Of Hope

By the end of the year there have been signs of a thaw in the cold war The appeal of Pandit Nehru has met with a hopeful res ponse both from Russia and America The U N Political Committee on December 15 adopted a resolution calling upon States 'to make every effort to strengthen international relations and to develop friendly and coopera tive relations and settle disputes by peaceful means as enjoined in the Charter President Eisenhower told the NATO summit confer ence in Paris on December 16 that the Western Alliance "was ready to join Russia in steer ing the world to true peace On December 19 the NATO Conference *communique* an nounced that "it was willing to promote any negotiations with Soviet Russia likely to lead to the implementation of the Western disarma ment proposals The *communique* added that if the Soviet Union refused to take part in the work of the United Nations Disarma ment Sub-committee 'we would welcome a meeting at the Foreign Minister s level to re solve the deadlock'

Thus the Western countries have given some hope of easing the situation created by disarmament deadlock and of lessening the tension due to cold war Now it is Russia's move to respond to the call of ending the mutual mistrust suspicion and ill will The bonafides of Russia's declaration of peace is at test Let us hope the Big Powers will sit together and save humanity from a threat of war and ultimate ruin

By the end of the year it is customary to assess the events of the year and make new resolutions and hopes based on the experience of the past By saying good bye to 1957 let us assess what progress we have made for bettering the lot of humanity where we have succeeded and where we have failed Enrich ed with knowledge experience and achieve ments of the passing year let us enter the new year 1958 with faith and goodwill towards humanity and with the hope that the new year will bring us nearer to peace which is essential for progress of mankind

TO OUR READERS

In commemoration of EIGHTH REPUBLIC DAY OF INDIA the next issue (February 1958) of the Careers & Courses containing special articles of interest for the readers, shall be on sale at all book stalls throughout India by 26TH OF JANUARY 1958

With this issue (January 1958) the Careers & Courses commences its tenth year of service to our readers in general and to the student community in particular It has been our endeavour to cater inter esting and useful material to the readers and with this view in aim we have introduced several new features in the past and intend to add more in the future To make this magazine still more useful and informative our readers cooperation is essential We request the readers to write us what topics they like in the magazine or they would like to be incorporated in the future

We thank all our readers and well wishers for their past cooperation and wish them A VERY AND PROSPEROUS NEW YEAR —Mg Editor

SYRIA--The Cradle of Arab Nationalism

By Z H KAZMI

The cradle of Arab nationalism, Syria or Suriya as it is called by the Syrians, has during the past ten years, occasionally made headlines in the world Press The present tension in West Asia has once again turned the spotlight on this strategically situated country

Stretching along the eastern shores of the Mediterranean Sea, Syria occupies the North-Western part of the great Arabian Peninsula It has an area of 66,046 square miles and is inhabited by nearly 4 million people The country has the usual Mediterranean climate and is sunny, dry and healthy

The evil of antiquity shrouds the exact time when the human race first set its foot on this fertile land yet the semetic tribes with their flecks of sheep and goats are known to have wandered on the Syrian pastures centuries before the dawn of civilization and they were in all probability its first settlers

Flanked by ancient empires, Syria has, except for a few golden epochs, seldom enjoyed complete peace and prosperity throughout its nearly five thousand year old history In 2750 B C. Akkadians, of semetic origin, under their great leader, Sargon I, founded an empire over the vast region now called Syria and Iraq

With the decay of the Akkadian Empire Syria was occupied by the Babylonians They were followed in turn by the Egyptians the Assyrians, the Babylonians again, the Persians, the Romans the Muslim Arabs, the Turks and the French In 1944 the Syrians wrested independence from their French exploiters after many a blood bath and declared their country a republic

Syria has a unicameral Assembly elected by the people every four years The Assembly elects the President and appoints the Council of Ministers from the majority party

Foreign Intrigues

Now a bone of contention between the world s two Power blocs, this young republic was repeatedly shaken by the internal dis orders and foreign intrigues during the years 1949 to 1954 and its Capital—Damascus—has during this short period witnessed as many as four *coup d etats* President Shukry Bey Alkuwatly was forced to resign by Col Husni Zaim, who installed himself as Presi

led by Col Sami Hanavi, Col. Zaim was overthrown, arrested and executed on August 14 1949 Col Hanavi however, soon restored the power to the political leaders The Greater Syria Scheme—formation of a single State consisting of Syria Jordan and Iraq—sponsored by the late King Abdulla of Jordan in 1951, sharply divided the public opinion in Syria, and paved the way for yet another *coup* in which Lt General Adib Shishkly seized the power In January, 1954 Sultan Altarash the leader of the warlike Druze tribe of Jabl e Druze (Southern Syria) raised the standard of revolt against Shishkly's regime He was later supported by a number of military officers headed by Captain Mustafa Hamaduni Finding the situation out of his control, General Shishkly fled to Saudi Arabia and the country once again returned to the constitutional ways, and the reins of Government has since remained in the hands of the elected leaders

Sixty six year old Shukri Bey Alkuwatly, the present President of the Syrian Republic, was elected to the post in 1955 for the third time His career, inextricably linked with the Arab struggle for liberation from the foreign yoke, is a saga of sacrifices and self denial He plunged himself in the nationalist movement in 1915 and though repeatedly arrested, tortured and twice sentenced to death in absentia he continued the freedom battle until his country achieved complete independence. During his presidentship Alkuwatly has initiated many reforms and development projects which have brought prosperity to the people In foreign affairs, he advocates a policy of close co operation with other Arab States and non alignment with any of the world s Power blocs

Damascus the picturesque Capital of Syria is the world s oldest continuously inhabited city Though western in outlook, the Syrian Capital still retains a substantial flavour of the Orient. Most of the ancient magnificent buildings of the city have been either burnt down by the accidental fires or d stroyed by the French bombardments in 1921, yet Azam Palace Ommyyad Mosque Takkiya Mosque, Sultan Saladin s Tomb and Roman Arcade still stand to bear testimony to its past architectural glory Museum, Parliament House and Railway Station are among the modern buildings worth visiting

'urope. Stuffs of silk, cotton and wool produced locally, are of lovely texture and design

Much sung by the Arabian poets and called 'the Golden Brook by the Greeks, the *Nahr e Baraza* or Baraza canal passes through the city and supplies the drinking water to its population.

Lying at the crossroad of the ancient caravan routes Palmyra, the queen of the Syrian desert attained a high degree of civilization in the beginning of the first century A D Her celebrated Queen Zenobia resolutely defied the mighty armies of the Imperial Rome in the third century B C. but was ultimately defeated and saw her prosperous Capital destroyed Its looted wealth carried to Rome dazzled the eyes of the Roman citizens The ruined palaces, temples and lavish tombs of Palmyra recall to memory its bygone glory

In fact, the entire country is strewn with the monuments that speak of its past grandeur

Aleppo, Homs Hamma and Latakia are other notable cities of Syria

Modern Education

The country has a public education system but a number of private and foreign schools also exist There is a good university at Damascus and agricultural and engineering colleges in other cities The progress and expansion of agriculture and industries has been mainly responsible for the growing increase in the national income

Agriculture and textile industry are the mainstay of the Syrians, who are mostly Muslims and speak Arabic

In short the different aspects of Syria's glorious past and her awakened present can best be described in the following words of a Syrian —

"Syria made splendid contributions to the development of world civilization and in Arab history served as torch of a great culture, radiant with principles of humanity and products of man's inventive power, as cradle of ancient civilizations she led the human race along the path of progress disseminating light and combating darkness.

"In Syria's desert are impressive pictures of man's struggle against the forces of nature and his endless exertions to make full use of earth's hidden wealth.

"Syria is a small country of four million people, but in her progressive tendencies— Arab States—constitutes a rich store of hope for the future of man in an awakened East.'

YOUTH LEADERSHIP TRAINING CAMPS

To equip the teachers to guide students on the right lines, Youth Leadership Training Camps have been sponsored and organised by the Union Ministry of Education

In these Camps the teachers are given short-term training to enable them to organise extra-curricular activities in their institutions more effecively

Six such camps have already been held for selected batches of college and University teachers

The first camp was held in Srinagar for teachers of the Punjab University, the second at Mahableshwar for the Universities of Baroda Bombay Gujerat, Poona and Karnatak the third at Ranikhet for the Universities of Aligarh Agra Lucknow, Banaras and Allahabad the fourth at Ooty for the South Indian Universities of Madras, Andhra Mysore and Travancore the fifth at Darjeeling for the Universities in the Eastern Region of the country, and the sixth at Hyderabad for the remaining Universities

Dramatic Training Camps are also organised for a group of teachers where training is imparted to them to look after the cultural and emotional needs of the youth. Three such camps have already been organised

Since these Camps have proved useful, it has been suggested to the State Governments and the Universities to organise Youth Leadership Training Camps and the Dramatics Training Camps directly, for which the Ministry has agreed to render financial assistance up to the extent of 75 per cent of the expenditure subject to a maximum of Rs. 3 000 per camp

The State Government and the Universities which have taken advantage of this help so far are (1) Punjab Government, (2) Jammu and Kashmir University (3) Gujerat University, and (4) Annamalai University

A provision of Rs 50 thousand has been made for 1957 58 out of an allotment of Rs. 8 75 lakhs in the Second Five-Year Plan for such camps

ENGLISH AS NATIONAL LANGUAGE OF INDIA

By Gen K M Cariappa

For some inexplicable reason some people started a sudden hate for the English Language in India soon after we got our Independence. Why, I do not know The gaining of our Independence to rid the country of foreign rule did not mean that the language which our past rulers spoke and which we have been learning for decades should go too I know we must have a National Language in a country of some 362 millions with 13 to 14 different languages and over 250 dialects in all, a language which can be spoken and understood by our people from Kashmir to Kanyakumari and from Shillong to Saurashtra, to bring about unity amongst our millions to work as a team and help build the India of our dreams—a land of Indians with plenty, prosperity and peace We have this language—Hindi, but why this urge to banish English from the curriculum of our schools and colleges is hard to understand Let us not please stop teaching our children English We will be doing them a great disservice and generally a great harm to our country in the future, if we do not teach them this language from their early school days.

English is being spoken by more and more people throughout the world Some of the finest literature in the world and thousands of books on science in all its aspects and ages including books on 'atomic and nuclear' subjects are all mostly written in English We have been studying and do study these books and I hope will continue to do so in this language for the good of India and the world. A day might come as indeed it must when all books on technical subjects are written in our own national language But this will take time—years and years India is taking an active part in the study of scientific developments, particularly in nuclear energy and this is all being done at the moment by our scientists and students in the English language

At international conferences where India is being represented more and more everyday, where our delegates have been doing great work, most of the democratic countries represented speak in English The knowledge of English is a great asset to our delegates at these conferences

Trade Expansion

India is rapidly extending her world trade particularly with all the Commonwealth countries and America where English is spoken Indian business representatives who visit foreign countries in ever increasing numbers would find the knowledge of English Language indispensable Our country is becoming a tourists "MUST in their itenerarics because of the glorious things we have in our country—things of historic greatness, natural beauty and works of great art and culture Practically every one of the very large number of visitors to India speaks English If the thousands of our people in all walks of life who normally cater for the needs of these tourists cannot speak English, this industry—the "Tourists Industry which can and will bring big revenues to our country, will be seriously affected

There is yet another good this language is doing us to provide for the unity of India. It is in our legal branches To quote the words of the late Dr H C Mukherjee, a well known educationalist and who was the Governor of West Bengal —

It is very important in the national interest that the beneficial results which have been accrued from the universal use of English in the different High Courts in India will be preserved, at least until all our judges and lawyers have become familiar with the National Language Among these benefits I may mention the development of an All India Bar and an all India Jurisprudence arising out of the citation of the rulings of the different High Courts every where in India and the consequent interpretation of All India Codes and the statutes on a sound basis as also the facility with which judges have been recruited from different regions to man the Supreme Court. Judicial isolation of each State if I may so describe what would follow from the use of the regional language by every High Court, will be a grievous misfortune which may even impair the political unity of India

It will take very many years to get all the Law Courts big and small, throughout our country doing their work in the present prescribed National Language— Hindi.

It was in this language that we fought for and gained our Independence It has helped us and continues to help to easily establish and maintain our international and interstate contacts If we neglect the continued study of English we will find it hard to keep up our rightful place in the commercial, intellectual, cultural international and economic worlds of today

Europe Stuffs of silk, cotton and wool produced locally, are of lovely texture and design

Much sung by the Arabian poets and called 'the Golden Brook by the Greeks, the *Nahr e Baraza* or Baraza canal passes through the city and supplies the drinking water to its population

Lying at the crossroads of the ancient cara van routes Palmyra, the queen of the Syrian desert attained a high degree of civilization in the beginning of the first century A D Her celebrated Queen Zenobia resolutely defied the mighty armies of the Imperial Rome in the third century B C. but was ultimately defeated and saw her prosperous Capital destroyed Its looted wealth carried to Rome dazzled the eyes of the Roman citizens. The ruined palaces, temples and lavish tombs of Palmyra recall to memory its bygone glory

In fact the entire country is strewn with the monuments that speak of its past grandeur

Aleppo Homs, Hamma and Latakia are other notable cities of Syria.

Modern Education

The country has a public education system but a number of private and foreign schools also exist There is a good university at Damascus and agricultural and engineering colleges in other cities The progress and expansion of agriculture and Industries has been mainly responsible for the growing in crease in the national income

Agriculture and textile industry are the mainstay of the Syrians, who are mostly Muslims and speak Arabic

In short, the different aspects of Syria s glorious past and her awakened present can best be described in the following words of a Syrian —

"Syria made splendid contributions to the development of world civilization and in Arab history served as torch of a great cul ture, radiant with principles of humanity and products of man s inventive power as cradle of ancient civilizations she led the human race along the path of progress disseminat-ing light and combating darkness.

"In Syria s desert are impressive pictures of man's struggle against the forces of nature and his endless exertions to make full use of earth's hidden wealth

'Syria is a small country of four million people, but in her progressive tendencies—sister Arab States—constitutes a rich store of hope for the future of man in an awakened East."

English is being spoken by more and more people throughout the world Some of the finest literature in the world and thousands of books on science in all its aspects and ages including books on atomic and 'nuclear subjects are all *mostly* written in English We have been studying and do study these books and I hope will continue to do so in this language for the good of India and the world A day might come as indeed it must when all books on technical subjects are written in our own national language. But this will take time—years and years India is taking an active part in the study of scientific developments particularly in nuclear energy and this is all being done at the moment by our scientists and students in the English language

At international conferences where India is being represented more and more everyday where our delegates have been doing great work, most of the democratic countries represented speak in English The knowledge of English is a great asset to our delegates at these conferences

Trade Expansion

India is rapidly extending her world trade particularly with all the Commonwealth countries and America where English is spoken Indian business representatives who visit foreign countries in ever increasing numbers would find the knowledge of English Language indispensable Our country is becoming a tourists' "MUST" in their itineraries because of the glorious things we have in our country—things of historic greatness, natural beauty and works of great art and culture Practically every one of the very large number of visitors to India speaks English If the thousands of our people in all walks of life who normally cater for the needs of these tourists cannot speak English, this industry—the "Tourists Industry which can and will bring big revenues to our country, will be seriously affected

There is yet another good this language is doing us to provide for the unity of India. It is in our legal branches To quote the words of the late Dr H C Mukherjee, a well known educationalist and who was the Governor of West Bengal —

" It is very important in the national interest that the beneficial results which have been accrued from the universal use of English in the different High Courts in India will be preserved, at least until all our judges and lawyers have become familiar with the National Language Among these benefits I may mention the development of an All India Bar and an all India Jurisprudence arising out of the citation of the rulings of the different High Courts every where in India and the consequent interpretation of All India Codes and the statutes on a sound basis as also the facility with which judges have been recruited from different regions to man the Supreme Court Judicial isolation of each State if I may so describe what would follow from the use of the regional language by every High Court, will be a grievous misfortune which may even impair the political unity of India "

It will take very many years to get all the Law Courts big and small, throughout our country doing their work in the present prescribed National Language— Hindi

It was in this language that we fought for and gained our Independence It has helped us and continues to help to easily establish and maintain our international and interstate contacts. If we neglect the continued study of English we will find it hard to keep up our rightful place in the commercial, intellectual, cultural international and economic worlds of today

Two Centuries Old

In the circumstances we must continue to keep the English language in India as an obligatory language We cannot allow a false sense of nationalism to make us bury this great language which we have been learning for more than two centuries

I have a second and entirely different reason why I strongly advocate the retention of the English language in our country as the primary language, for all time I know many an ultra nationalist is bound to raise his eye *brow in horror and disgust at this suggestion* But let us please be honest and practical in our thoughts and in our action We must look ahead, well ahead, and plan for the distant future in everything we do in our nation-building particularly in this vital matter—the language

Mahatma Gandhi's dream was the creation of a One World Government where all countries lived happily under no foreign domination but working in co operation with each other sharing their haves with the have nots thus providing for happiness for mankind This dream has been repeated by many of our eminent leaders of today very frequently and very fully India wants a One-World Government If and when this comes off and I expect it will at some distant future—if all of us make an honest effort to achieve it would it not be necessary to bring about some homogenity of thought and action amongst the 2,500 millions or more peoples of this vast Universe to work together for the happiness of mankind? What else can bring about this homogenity better than a common language, which can be spoken and understood by these millions ? 'Esparanto was produced a few years ago as the International Language but it is yet to see the light of day It is still in cold storage, but the English language is being spoken more and more throughout the modern world everyday I believe at the historic Afro Asian conference at Bandung where some 28 African and Asian countries met together for the first time in history, the majority of the delegates spoke *in English* So why should we not think ahead and accept English to be the International Language ? We need not all learn this language in its entirety but basic English which has only some 800 words is all that is *necessary* Advanced English may and must be learnt by students and scholars So if we are really honest in out utterances in public, of our wish to see a One World Government, let us think well ahead now and have a flying start with this language business What a splendid example India will be setting to the rest of the World if we can make the English language the *Lingua Franca* of India !

Other Languages

I do not see any justifiable objection to having English as our National language, as long as the studying of our own languages each of which has rich literature is fully kept up and our youth are induced to learn at least one or two other languages in addition to their own regional languages

For the reasons stated, I with all the love and loyalty I have for my country and the love and loyalty I have for mankind, very strongly urge that we should have English as the National Language of our country If we honestly believe that this will help us in our service to mankind, let us take courage and be realistic and take a decision here and now and say ' English will be India s National Language ' We of today and our future generations can then play our parts effectively to achieve and keep for all time peace and happiness for mankind when the frequently expressed wish of ours to have a One World Government comes into being By God's grace it will come Nothing is impossible if we are honest and sincere in our efforts to achieve this aim

So let us have English as 'The National Language ' of India

—o—

DO YOU KNOW ?

Housing in India—1 (Urban)

About 19 lakh houses are expected to be built during the Second Five Year Plan period in the public and private sectors against 13 lakh units added in the First Plan

Rs 105 crore provision in the Plan for Government aided urban housing will result in the construction of 3 06,000 units

In addition the Union and State Governments will build about 7,69 000 houses for their own employees, for coal and mica mines and plantation workers

The private sector is expected to put up 8 00 000 urban houses with an investment of about Rs 800 crores

The shortage of houses in 1951 was 25 lakh and taking into account the new requirements, demolition and replacement of old houses the shortage in 1961 is expected to be about 57 lakh units or twice as much as it was in 1951 when the First Plan started

This estimate is based on a rise in urban population of about 206 lakh during 1951 61

PEOPLE WANT TO KNOW

The Editor of Unesco Features, Paris answers every month questions in the field of Natural Sciences He receives such questions from every part of the world. We reproduce below some of the questions and answers for the information and interest of our readers—Ed O & C

QUESTION

Senor Carlos Guerra of Guayaquil, Ecuador asks What is meant by 'high fidelity in the reproduction of sound? What is the actual role of an aerial on a radio receiver? What is meant by kilocycles in connection with receiving sets and tuning in" to a broadcasting station?

ANSWER

Sound is produced by the striking of waves in the air on the human ear The sensation of pitch results from the number of waves per second A low vibration rate produces a low sound and 16 per second is as low as can be heard 'Middle C on a musical instrument has 261 vibrations per second High notes need thousands per second

High fidelity is the ability of any sound reproduction device to reproduce accurately the exact number of vibrations that it receives, both low and high This was for many years almost impossible to achieve because the materials used in the horn or loud speaker were incapable of responding equally well to all rates of vibration Consequently some tones were feebler than others and good music could not be reproduced with high fidelity Many devices are used today to achieve fidelity but it is not easy

Radio and television are transmitted by electromagnetic waves that pass through the air and through most walls The antennae of a radio receiver detect these waves because the electrons in their wires are alternately attracted up into the antennae and down into the instrument making one such alternation or cycle with each wave that passes Thus the wave vibration is transformed into a rapidly alternating current in the radio receiver which is amplified by the tubes so that it becomes powerful enough to operate the sound producing membrane of the speaker' Thereby variations in the electric current become variations in the sound A kilocycle is a thousand cycles Each cycle corresponds to a wave Thus the figure of 500 kilocycles means that 500 000 individual el ctromagnetic waves are emitted per second by the broadcasting station and are received by the radio receiver The electrical system of the broadcasting transmitter is adjusted so that it emits exactly the number of kilocycles that is required F station has its own Similarly tuning in' radio receiver is the adjustment to different vibration rates and thus to between the programmes sent out by stations

QUESTION

Mr Philip Cool of Canberra has submi a question about DDT and malaria ... I believe that DDT is considered superior other insecticides for malaria control? B have also read that certain insects incl the malarial mosquito have become r to DDT Is this true and if so how can hope to control malaria?

ANSWER

What differentiates DDT from the insecticides is its persistency Man has trying to kill insects for many years smoke and other methods Then at beginning of this century it was found pyrethrum which is obtained from fl was very satisfactory insecticide began to synthesize certain organic in the laboratory and later these were industrially But DDT because of its s qualities superseded nearly all of these malaria control

The history of DDT is an interesting It was first synthesized by a German ch in 1874 He didn t have any thought at time of making an insecticide His thesis put away and was found by Dr Muller 1939 who noted the most special qualities the material which were not only but of very long duration This made poss an entirely new approach to the control insects for DDT is effective for a period to six months

It is true that certain insects including malarial mosquito are resistant to DDT other insecticides But according to Dr A A Brown of the World Health Or they have not acquired resistance in the that a person can acquire tolerance to c beverages and drugs as he grows up paradox is that the resistance is already to begin with A very few individuals in population of insects are normally much susceptible than the great majority of

fellows It is these individuals which are left as survivors from an insecticide application And their resistance is inheritable It is deter mined genetically just like blue eyes or blood types and is caused by definite hereditary factors which are called genes After several generations of selection by the insecticide these genes for resistance will accumulate and the whole population becomes resistant

These genes are not caused by the insecti cide itself producing sudden genetic changes called mutations but were already present in very low frequency in the population before the insecticide was applied. It is now known that populations of certain species of insects contain a few individual genes for resistance to certain insecticides which normally kill their fellows Application of insecticides thus is a process of artificial selection which over the generations results in the evolution of a resis tant population The whole process fits in per fectly with Darwin s concept of evolution through natural selection and the survival of the fittest

The striking thing about this is that the process takes place so fast—as it were be fore our eyes What is evolving is a mosquito which as it multiplies, will ignore the insec ticides and become a 'Master Race of mos quitos But it will take a number of years for the resistant insects to become a really dangerous threat That is why the World Health Organization decided on a Malaria Eradication Campaign With the cooperation of governments of countries afflicted by malaria and with a special malaria eradication fund the WHO s mobilizing experts and pro viding supplies of insecticides and malarial drugs It is a race against time to get rid of malaria before the resistance becomes really dangerous The mosquito does not pro duce malaria itself It has to draw blood from someone sick with malaria It harbours the parasite of the disease it acquires in this way and then deposits it by its bite in the blood of a healthy person But if we have got rid of malaria — if there is no diseased blood for the mosquito to drink—the insect whether it is resistant to DDT or not cannot pass on the disease So we have a few years in which by the combined efforts of the nations of the world we could wipe malaria from the face of the earth and the World Health Organization believes it can be done

QUESTION

Mr Max Levy of Medellin Colombia asks several questions on the possibility that the combustion products of motor fuel are among the causes of cancer

ANSWER

Unesco includes a Department of Natural Sciences but no Department of Medicine or of Medical Sciences These are the province of another Specialized Agency of the United Nations The World Health Organization in Geneva This column therefore does not answer questions that involve medical know ledge or opinion However in this case it can be said as a matter of common scientific information that (1) some tar like chemicals have been made from crude petroleum — but not from motor fuel (gasoline or petrol)—which have stimulated cancerous growth when smeared on the ears of experimental rabbits and (2) some studies indicate that people who spend much time driving motor cars in the crowded streets of large cities are more likely to develop cancer of the lungs than people who do not drive in heavy traffic There is no evidence to show that any specific substance contained in motor fuel has this effect and it is supposed that imperfect combustion is responsible However there is no agreement among authorities that there is any relation between motor fuels and cancer More research needs to be done and is being done At present there is not only no proof of any relation but also no proof that combustion gases are harm less

QUESTION

Mr John Armand of New Orleans writes "Florida is again waging a costly war against the 'Mediterranean fruit fly" which has des troyed many fruit plantations in Northern Africa and is a dangerous plague in southern Europe Is there any hope that science will win its battle against pests before it is too late?

ANSWER

Science now has the means to destroy any and all insect plagues but to apply them re quires the mobilization of large forces much money and the full co-operation of the public In any limited area such as an isolated island complete eradication is possible The diffi culty lies in the placing of a quarantine on an infested area and the absolute prevention of carrying the insect or its larvae or eggs to other areas This involves the minute and careful inspection of every vehicle every freight shipment all baggage and postal parcels Such inspection requires an army of inspectors and is strongly resented by travellers

and shippers Thus many insects escape and the plague spreads even when it has been con trolled at its original location Even the wind must be blamed for the present plague of fruit-fly in Florida is probably the result of the blowing of some of the flies to Florida from the Caribbean islands by a hurricane Science can destroy the insects but it takes more than science to find every single fly and egg and to prevent its escape to unprotected areas

QUESTION

Mr Donald Cook of Sydney Australia asks What is the cause of tidal waves? I have read that these waves are barely visible out at sea How is it that they wreak such havoc when they reach the coast And is it possible to get advance warning of such phenomena?

ANSWER

The primary causes of tidal waves are large earthquakes Out at sea such waves are hard to detect because though they travel at a speed of about 400 m p h they are only a few feet high The distance from the crest to the trough is some 15 miles long and the wave period takes several minutes to pass by When the tidal wave reaches the shallow water near a land mass however the front is slowed down and the fifteen miles of water piles up to form a steep fronted surge that can wreak tremendous havoc as it hits the land

In the Krakatoan earthquake which occurred between Java and Sumatra towards the end of the 19th century there were enormous casualties because the earthquake took place in shallow water close to the land and waves as high as 100 feet piled up and swept inland

In the Pacific area where tidal waves cause tremendous havoc ordinary earthquake phenomena are not easy to observe since many parts of the ocean are extremely deep But a series of seismograph stations set up to detect quakes in the area can give advance warning of tidal waves

The sound waves produced by earthquakes travel through the ground at a speed of about 5 miles a second—that is much faster than tidal waves When seismograph stations re cord large quakes the exact arrival time of the beginning of the ground waves are com pared and from these the position of the earthquake can be calculated Since tidal waves travel at roughly 400 miles per hour it is relatively easy to predict their time of arrival at places where damage may be expected

QUESTION

Mr Dalpt Singh of Delhi, India asks ' What is the real truth about telepathy?

ANSWER

The question implies that there is some doubtful truth about telepathy But this is a contradiction in the words since the truth must be true What is meant of course is that what some people think is true other people think is false or at least is not proved In that case the question becomes who is right about telepathy—the people who accept it as a fact or those who do not?

Such a question is quite normal with res pect to dozens or even hundreds of topics on the frontiers of science topics that are just emerging from the unknown into the known There are such decisions to be made in the study of the atom and of the universe in the chemistry of the body and in the causes of disease The real question is always in the scientific study of any phenomenon when is the point reached at which the new discoveries deserve our confidence? Are the new facts and conclusions reliable enough to be accepted as the truth? On such a question there is often a difference of opinion unless the evidence is conclusive For instance, nobody today can doubt that the earth is round because the evi dence is overwhelming But one can still doubt that the universe is expanding

The scientist s own definition of a fact or of the truth is that it can be demonstrated by careful experiments which can be duplicated by others with consistent results so that all competent observers agree

So what is the truth about telepathy de fined as the direct transfer of thought from one mind to other minds at a distance without any connecting means of communication? The answer is that many competent observers are convinced that telepathy exists but many perhaps most are withholding judgment and awaiting further evidence When competent experts disagree others can only conclude that telepathy may well exist and that our knowledge of it may turn out to be true but that it has not yet been proved

The International Labour Organisation

The International Labour Organisation is an inter governmental organisation which was established in 1919, as part of the Treaty of Versailles. After that bitter world war, it was realised that universal peace cannot be had without social justice It was on this basis that the I.L O was founded

Pioneers in the field had been giving thought to this question either as individuals or collectively from even a century before Among the earliest crusaders was Robert Owen who started as an ill paid apprentice and rose to be a wealthy textile manufacturer Besides establishing good working conditions in his own mill in Scotland, Robert Owen was responsible for having a Bill passed in Parliament in 1819 limiting the hours for chil dren. There were other such individual pioneers on the continent of Europe also who took a lead in improving conditions of factory workers in their own countries and also furthered the idea of international legislation One of them wrote "Let nations unite for social reforms instead of frustrating one another s efforts Along with this was the growing development of trade union movement and while these started on the national plane particularly in England and France inter national trade union movement had come to stay by the close of 19th century though on a modest scale

The work of the early reformers and the rise in trade union movement greatly contributed to the formation in 1900, of the International Association for Labour Legislation The Association had constituent committees in 15 States and Albert Thomas, the first Director of the I L O was a member of the Association s French Com mittee This Association even adopted inter national conventions for abolishing the use of white phosphorus in matches and prohibi tion of night work among women.

Pioneering Work

The cumulative effect of all this pioneering work played not a little part in paving the way towards the founding of the International Labour Organisation. A Commission appointed to prepare for the Peace Conference adopt ed a resolution declaring that the Treaty of Peace which will end the war and which will give to peoples freedom and political and independence must secure for of all the countries a moral and material guarantees regarding the right to work, the right to organise, regulations of imported labour, social insurance, hours of work and the health and safety of the workers This Commission also recommend ed, the establishment of an International Labour Office to collect material on labour legislation and statistical data etc. It is in pursuance of the recommendations of this Commission and consideration of the same at the Peace Conference that the I L.O was first established in 1919, It is thus clear that its foundation was the result of gradual evolution starting from even a century before

Tripartite Structure

In 1946 the I L O became the first Specialised Agency of the United Nations At present seventy-eight countries are its mem bers. Membership includes countries both big and small so that by and large the organisation is truly global in every respect. Another feature distinguishing the I L O from other Specialised Agencies is its tripartite structure This is a fundamentally important point on which depends whatever measure of success the Organisation has achieved so far The I.L.O has no power of sanction or enforcement and has to depend, for all its success, on mutual agreement not only between coun tries but also among the main parties con cerned In the particular field of social justice and a fair deal for the working classes, the parties directly concerned are obviously the employer and workers The State is however no less concerned as it is the State that has to take legislative or other appropriate measures, based on the conclusions reached at the I.L O conferences Besides the States has a responsibility for ensuring the interests of the consumer and the public at large. In these circumstances real value can result from con clusions only if these conclusions themselves are reached on the basis of agreement by the tripartite constitution of the I.L O where, in all deliberations at the Conference, the Governing Body or Industrial Committees, all the three parties—governments employers and workers—are represented with full free dom to discuss and vote independently

The main components of the I.L.O are (i) International Labour Conference (ii) Governing Body, and (iii) International Labour Office.

Policy Making Body

the supreme policy making body of the Organisation In its own sphere we may call it a World Parliament. The Conference brings together more than 700 delegates advisers and observers from nearly 80 countries and territories The Conference alone can adopt international Conventions and Recommendations and this also only on a vote of support from two-third of those present Though member countries are not legally bound to ratify the I.L.O Conventions, they are required to place them before respective national Parliaments If the Government decides not to ratify a Convention, it is expected in placing the case before Parliament to give reasons for such inability Member Government's are also required to submit periodical reports on unratified Conventions, indicating steps taken, if any towards measures which will make ratification at a subsequent date more feasible The Conference meets regularly every year and tripartite delegations from all the Member countries take part The adoption of Conventions and recommendations though a major task of the Conference is by no means its sole work

Discussions at this Conference give valuable guidance to the office for its further studies towards possible action on the international plane The discussions also contribute substantially towards better understanding not only between the parties from individual countries but also between the different member countries towards solution of common problems after an appreciation of each other s difficulties The Conference adopts the I L.O budget which is financed by contribution of Member Governments. It also elects the members of the I.L O Governing Body

Governing Body

The Governing Body is the Chief Executive body of the Organisation. As such it meets more often normally four times a year This Body is also tripartite in character with a membership of 40 20 government and 10 each representing employers and workers Out of the 20 government members 10 represent countries of chief industrial importance which thus have a seat without having to stand for election. Incidentally India is one of these 10 The Governing Body is responsible for effective programming of work settling of agenda for the annual conference setting up of industrial committees expert committees and *ad hoc* committees as may be required from time to time and to consider and decide on action to be taken on the reports of these committees

International Labour Office

The International Labour Office is the Secretariat of the Organisation with over 800 persons nationals of nearly 60 countries Many of these are specialists in different fields The Office is continually engaged in researches and studies in such subjects as industrial health and safety, co operatives and handicrafts agriculture, conditions of work, problems of seafarers welfare of indigenous workers and workers in non self governing territories The Office is also reponsible for preparation of documentation and providing the secretariat for the annual conference regional conferences and committees held in all parts of the world also for the various publications relating to social ond economic problems statistics and other allied matters It sends from time to time missions of investigations of charges of substandard conditions and offer to give friendly expert advice for improving them

Technical Assistance

Till the launching of the United Nations Technicsl Assistance Programme in 1950, field work of this type was rather limited in scope. But subsequent to I L O s participation in the U N Technical Assistance Programme its operational activities have increased considerably and though the creation of world standards is still a very important part of the I.L O s work the activities connected with technical assistance are assuming almost equal importance

By the beginning of 1957 it had undertaken over 400 technical assistance projects in Asia Latin America Africa the Middle East and elsewhere helping the less developed countries with the many problems of industrial and agricultural expansion

Its aim is to help put peace on a solid base of social justice Its motto Poverty anywhere is a danger to prosperity everywhere

With this in mind it undertook more than 100 vocational training projects in various parts of the world about 60 in co-operation and handicrafts and more than 40 each in the fields of social security and general man power and employment service organisation Other projects dealt with such questions as migration agricultural workers labour legislation women and young workers industrial safety and hygiene labour productivity and labour statistics The first 700 I L O experts sent on technical assistance projects were drawn from 46 different nationalities In

addition the I L O awarded over 1,000 fellowships and study grants to underdeveloped countries and placed more than 800 workers and foremen for practical on the-job-training in factories abroad

Conventions

Up to the present time the member countries have deposited more than 1650 ratifications of conventions at I L O headquarters in Geneva Some of the 88 conventions which have received enough ratifications bring them in into force call for freedom of associations an eight hour day, protection of wages and holidays with pay Some of them forbid. night work for women and the young employment of women in mines and forced labour and peonage

Member countries, whether or not they ratify Conventions are expected to examine them for possible ratification and to report to the I.L.O from time to time concerning the state of local law and practice In this way I L O Conventions influence standards even in countries where they have not been ratified.

The I.L.O shows the way it does not command.

I.L.O conferences also have adopted 104 official Recommendations to governments These do not require ratification They together with the Conventions help to round out the body of world labour standards which has become known as the International Labour Code

This Code of Conventions and Recommendations deals with a wide range of subjects including unemployment medical care social security, migration employment agencies, weekly rest periods maternity protection organisation of employment, labour inspection services maritime working conditions labour clauses in public contracts compensation for employment injuries the right to organise and the right to bargain collectively

Industrial Committees

Since 1945 eight industrial committees have been set up to help solve the social and economic problems peculiar to particular industries The meetings are attended by two representatives each of the workers employers and governments of the countries represented on each committee

The committees are now organised for coal mining textiles, construction iron and the metal trades inland transport petroleum production and refining, and chemicals

In addition a large number of commissions and committees exist to further the work of the Organisation in specific fields.

There are also a number of correspondence committees on such questions as recreation, women's work juvenile employement, occupational safety and health labour statistics and co-operation

This in brief, is what the International Labour Organisation is and how it functions In conclusion it may be appropriate to mention that in 1944 the International Labour Conference meeting at Philadelphia, reaffirmed the I.L O s devotion to peace The workers, employers and government reprepentatives of the member countries adopted a declaration which says that it is the solemn obligation of the I.L O to further among the nations programmes designed to achieve a series of social objectives which include

full employment and a living wage,
extension of social security
adequate food housing and recreation,
the right to bargain collectively,
equality of opportunity, and
adequate health and safety measures

All the countries and all the groups represented at the conference were in agreement on these principles

But in order to be effective they must be understood In the long run the work of the I.L O depends on informed and intelligent *public opinion*

ONE WITH THE UNIVERSE

I see God in every person—working through all hands walking through all feet, and eating through every mouth In every being He lives, through all minds He thinks He is self-evident, never unto us than ourselves To know this is religion is faith and may it please the Lord to give us this faith ! When we shall feel that oneness we shall be immortal

We are physically immortal even one with the universe So long as there is one that breathes throughout the universe I live in that one. I am *not this limited being I am the* universal—I am the life of all the sons of the past. I am the soul of Buddha of Jesus of Mohammed I am the soul of all the teachers all the robbers that robbed and all the murderers that were hanged I am the universal—stand up then this is the highest worship You are one with the universe —*Vivekananda*

LIFE ON SPUTNIK

By P ISAKOV, M Sc (Biology)
Stalin Prize Winner

An exceedingly difficult, exceptionally im portant stage in mastering cosmic space has been covered For the first time in the history of our planet man made devices have penetrated inter planetary space and are revolving around the Earth Following the first artificial satellite which proved the possibility of systematic radio communication with cos mic space another sputnik has appeared in the sky It is of much bigger size is equip ped with instruments for research and even carries a live passenger the dog Laika This is done in order to verify a number of theo ries concerning the action of many factors of cosmic space on living beings to test the protective measures from the influence of factors which can prove harmful or fatal The data received during this experiment are necessary for organizing future cosmic flights of people to the Moon, Mars and Venus.

Without Atmosphere

Flights of both animals and men in cosmic space are possible only in hermetically sealed chambers in which the air is close for its composition and pressure to that on Earth

It is known that there is no air no oxygen in inter planetary space To ensure the respiration of an organism in a cosmic appara tus a stock of oxygen is needed For this purpose it is expedient to use liquid oxygen During the evaporation of one litre of the liquid about 800 litres of gas are formed But the stocking of liquid oxygen is rational only during relatively short flights It will be difficult to take huge stocks of liquid oxygen for flights lasting several months and more In such cases it is more expedient to set up special hothouses on the space ship Plants will absorb carbonic dioxide from the air and emit oxygen

The absence of barometric pressure of the air is an important factor of inter plane tary space as compared with the conditions of life on Earth Let us recall that the neces sary quantity of oxygen is soluble in the blood only at definite barometric pressure. If the barometric pressure is insufficient even the respiration of pure oxygen cannot ensure the organism s requirements of it.

This however does not exhaust the role of barometric pressure The point is that all liquids in the organism, blood in the first place contain dissolved gases—oxygen nitrogen carbonic dioxide etc If barometric pressure of the air drops the dissolved gases leave the blood In case of a sharp drop of barometric pressure such a quantity of gases may escape at once from the liquids in the organism that this will involve grave consequences and at times even a full derangement of the organism s vital activity

The temperature at which liquids boil depends on the surrounding pressure The lower the pressure, the lower the temperature at which boiling begins At a pressure of the mercury column of 47 millimetres (and this corresponds to 19 kilometres above sea level) a liquid begins to boil hardly reaching 37 C. This is exactly the temperature of human blood The boiling of blood inevit ably entails grave consequences

When can such derangements arise? This can happen if the hermeticity of the chamber is suddenly broken Naturally it is necessary to take beforehand measures to prevent such accidents

How can this be done ? Firstly, by creating the necessary barometric pressure in the chamber But such a method is not very reliable, since any breach in the wall any upsetting of the hermeticity would cause grave and often irreparable consequences The second method is to use special dress or altitude suits

The necessary barometric pressure is maintained in the special dress in the altitude suit the pressure is created by stretching the fabrics of the suit which grips tightly the human body

In practice the two methods are combined

A suitable temperature of the environment is an important condition for the normal existence of human beings On Earth organ isms are subject to a fluctuation of the temperature of the environment in a relatively small range—approximately from 70 to − 70°C. This, however does not mean that all animals are adapted to such fluctuations of the tempe rature The first experiment of launching a Sputnik with a dog has already shown that Soviet scientists are solving correctly the problem of creating the necessary temperature regime within the Sputnik. During the

first hours of flight the dog behaved calmly and its general state was satisfactory

The inhabited satellite is equipped with instruments for the study of temperature and pressure

Sun means not only Life

It is exceedingly important to study with the help of satellites the influence of various forms of solar and cosmic radiations on living organisms

It is known that a small part of the sun rays reach the surface of our planet The other part is retained by the Earth s atmosphere Thus, for example the ultra violet part of the solar spectre is retained by the atmosphere, almost completely In the upper layer of the atmosphere as beyond its bounds, the intensity of ultra violet radiation is so considerable that it is fatal for living cells But protection from the action of ultra violet radiation from the sun is not a difficult problem since most materials including ordinary glass keep out this part of the solar spectre

But solar radiation also has the so-called X ray radiation The action of X rays at first entirely imperceptible for the organism can lead to very undesirable consequences

There are, however no grounds for fearing them excessively On Earth, too workers in some professions have to deal with such radiations Protective measures have been worked out reliably safeguarding people from them

Cosmic rays or cosmic particles as it is more proper to call them can be much more dangerous

Cosmic particles consist of nuclei of different chemical elements Cosmic rays contain most of all (about 80 per cent) of hydrogen nuclei There are less of the heavier nuclei, for example, nuclei of iron.

The intensity of cosmic particles is not the same at different altitudes Landing into the Earth s atmosphere cosmic particles clash with molecules of air and their energy is lost in ionising the molecules. Only an extremely insignificant number of cosmic rays penetrates the lower layers of the atmosphere But already at an altitude of about 200 kilometres their number increases 150 fold. The intensity of cosmic particles is still greater in inter planetary space It is held that beyond the bounds of the atmosphere the intensity of cosmic particles equals approximately 0 5 a second per one square centimetre

The velocity of cosmic particles is exceedingly great and it approaches the speed of light. Possessing tremendous kinetic energy such particles clashing with molecules of other substances cause their dissociation disintegration into ions Ionisation of molecules also takes place when cosmic particles penetrate the tissues of an organism This leads to the destruction of cells to morbid phenomena similar to those caused by gamma radiation arising during nuclear reactions.

The penetration of one particle into a tissue of an organism is still not dangerous. The point is that even particles of such heavy elements as zinc and iron cause damage to only 15 000 cells approximately Compared with total number of cells in an organism, about 1 000 000 million this of course is infinitesimally small It is clear that of significance is also the place where such a particle gets It is one thing if a particle causes the destruction of fat cells in the subcutaneous layer and an entirely different matter in the case of nerves of the cardiac muscle, or vitally important centres of the cerebrum

The question naturally arises' how is the organism to be protected from cosmic particles So far there are no fully completed projects on this score The published data speak of great difficulties of protection The presence in cosmic particles of nuclei of heavy elements complicates this task. The point is that even the most powerful artificial sources in the laboratories do not create so far particles with energies which could be compared to the energy of heavy nuclei of cosmic radiation The launching of a satellite with animals will enable scientists to obtain highly important data on this question

The task of science is not only to determine the permissible number of such blows to the tissue of an organism to ascertain the intensity of cosmic particles, but also to establish the time in the course of which undesirable consequences may arise It is known that the so called latent period i.e., the time from the moment cosmic particles land in the organism and the moment their action becomes manifest can last for weeks and even months For this purpose in a number of cases the animals after staying in the satellite will have to be brought back to the Earth for their subsequent study

The second Soviet artificial Earth satellite is equipped with measuring instruments for investigating all the above mentioned "radiational influences of cosmic space short wave

ultra violet and X ray radiation of the sun and cosmic rays

It is necessary to say a few words of the so-called meteorite danger

It is known that more than a ton of meteorites penetrate the atmosphere of our planet daily Possessing huge velocities 30 50 and more kilometres per second they are heated by friction with the air and burn in the upper layers of the atmosphere As a rule meteorites do not penetrate to altitudes lower than 70 100 kilometres But the higher the altitude the greater the possibility of a sputnik encountering meteorites It is important to establish to what extent such a possibility depends on the altitude of the orbit, the season of the year etc

The first weeks of flights by Sputnik No 1 show that it has not been subjected to the action of meteories of destructive forces The meteorite particles which can only drive a hole in it are not a serious obstacle for ensuring the life of animals within the satellite. Protection against such particles can be set up either by arranging a metal screen absorbing the energy of these particles at some distance from the shell of the sputnik or by deviating these particles by electromagnetic radiations or by other means. It is not precluded that the probablity of clashes with meteorite particles will prove to be no greater than the probability of motor traffic accidents

How much does Laika weigh in the Sputnik ?

The living' space in sputnik is limited very rigidly That is why mobility of animals in a satellite has to be greatly restricted Such restriction of the mobility causes changes in the vital activity of the organism It is known for example that when a man is confined to bed for a long time it is necessary in a number of cases to take measures to prevent haemostasis Naturally such measures which are applied automatically have also been worked out for animals within a sputnik

For a satellite to reach its orbit it has to be accelerated to about 8 000 metres per second Since such speed has to be attained soon after a satellite is launched it is natural that prolonged and considerable acceleration has to be employed

If acceleration acts in the direction from the feet to the head of a man this may cause redistribution of the entire mass of blood in the organism In the lower parts of the body there will be more blood than usual, while in the upper parts there will be a shortage of it. During considerable intensity of acceleration this may reduce the usual level of blood circulation in the cerebrum and lead to a derangement of the functions of the central nervous system up to the loss of consciousness

If acceleration acts on man not along his body but in a perpendicular direction it can be withstood much easier Special suits which grip tightly certain parts of the body and do not allow blood to accumulate in them help to fight overloads These questions too, are being studied in experiments with animals

A few words about the speed of movement which an organism can stand It is known that uniform speed does not exert any effect on the organism But the greater the speed of movement the harder it becomes for man to orient himself in space Therefore main control of cosmic flights will be done from ground stations with the help of electronic computing machines in accordance with a programme drawn up in advance Thus in cosmic flights astronauts will be free from the task of directly controlling their flights, since this is literally beyond the capabilities of man

Let us go over to the question of absence of the force of gravity or zero-g which cosmic travellers will inevitably encounter The action of zero-g has been studied both in the case of animals and man in the recent years True these observations pertain to brief influences of zero-g lasting no more than scores of seconds. There is no doubt that the influence of prolonged zero-g may prove to be entirely different This is exactly what satellite carrying animals have to establish

We make all our movements on account of weight. For example raising our arms upward we overcome the force of the Earth s gravity while the same force facilitates movement when we lower the arm It may be assumed that if the force of the Earth s gravity ceases to exert its influence the usual coordination of all motions will be upset The muscular exertion for raising an arm worked out in the course of the entire preceding life, may prove to be unnecessarily great. And conversely the lowering of an arm will require unusually greater exertions since its weight which helps to lower the arm will be absent. However these experiments have revealed the remarkable ability of the nervous

system to adapt itself quite quickly to the zero g conditions

Zero-g undoubtedly also influences such functions of the organism as respiration blood circulation the temperature of the body etc. It is known that the weight of the blood is one of the factors participating in the regulation of blood circulation The exclusion of this factor in zero-g conditions may affect the distribution of blood in separate parts of the organism Observations show that zero-g causes a certain lowering of blood pressure

Under the effect of accelerations gas exchange in the organism increases, the consumption of oxygen and the emission of carbon dioxide rise several times During zero g we may expect a lowering of the gas exchange, at least after the organism will become adapted to the absence of gravity These data are important for ensuring oxygen to animals and determining the capacities of air conditioning devices

There is one more important circumstance demanding the launching of animal carrying satellites We refer to the saving of a crew of future astronauts We discussed earlier some protective measures in conditions of cosmic space when the hermeticity of the chamber is broken But unforeseen circumstances may compel the pilots to leave the space ship It is necessary to foresee the possibility of saving the people in such cases as well Naturally it is expedient to conduct such experiments with animals at first. Moreover for scientific purposes, too it would be highly desirable to save the animals after a sputnik finishes travel along its orbit This is necessary specifically for studying the subsequent state of the animals.

Where are Biological Frontiers

Beginning with very low altitudes our atmosphere rapidly loses all its qualities so necessary for the life of organisms The ability of the atmosphere to maintain normal gas exchange of man s organism extends only to an altitude of about 5 kilometres

Insufficient barometric pressure of the atmosphere makes itself felt beginning with an altitude of 8 9 kilometres The appearance of so called altitude pains associated with the emission of nitrogen bubbles from the liquids of the organism is possible at this altitude.

The so-called reserve of time that is the period when man retains consciousness after the supply of oxygen stops is practically the same beginning with an altitude of 19 20 kilometres For example if the supply of oxygen is cut at an altitude of 12 kilometres, a man can take the necessary measures without the danger of losing consciousness for approximately 30 seconds At 15 kilometres, the time reserve is shortened to 15 seconds At an altitude of 19 kilometres, as pointed out above the time reserve is very small and practically does not depend on the further increase of the altitude

At an altitude of 19 200 meters where the general barometric pressure of the mercury column is 47 millimetres it will already be necessary to take measures for the protection of an organism from the boiling of liquids

The borderline of absorption of heavy particles of cosmic radiation passes around 36-37 kilometres About that altitude serious protection from cosmic particles is necessary The region where the ultra violet part af the solar spectre is equivalent to that in inter planetary space begins 42 43 kilometres above sea level

Meteorites usually burn up at an altitude of about 100 kilometres

Beginning with an altitude of 122 kilometres the propagation of sound becomes impossible At this altitude the distance between the molecules of air equals approximately the length of sound waves man can hear Above this border air molecules are scattered even more

Approximately at this altitude the intensity of cosmic particles begins to grow sharply

As for the region where satellites can exist for a long time, it is located much higher than all these boundaries

Our times are the times of the rapid ever accelerating development of science and technology The launching of artificial Earth satellites particularly of the second Sputnik, with an animal on it signifies the advent of a new era in the history of science in the history of man s mastery of cosmic space At the same time it also signifies the beginning of a systematic advance into the Universe. We believe that within the next 5-10 years flights of people in cosmic space possibly with the landing on other planets of our Solar system will become a reality

---

CHALLENGE AWAITING INDIAN YOUTH

By Mr HUMAYUN KABIR
(Minister of Civil Aviation)

Mr Humayun Kabir delivered the convocation address of the University of Jammu and Kashmir at Srinagar on 19th October 1957 Following is the text of Mr Kabir's address

I do not deny that our educational ideals and practices need change and reform but I do not believe that they merit the sweeping condemnation so often meted out to them they have defects, but they also have merits and they have served us well in certain respects

It is sometimes said that the Indian youth of today suffers from a sense of frustration and lack of opportunity This is a complaint which I, for one, have not been able to understand.

There might have been causes for such complaints in the past, but the sky is the only limit for the young men and women of modern India Today in a free country whose future they are themselves going to fashion there should be no cause for a sense of restraint or restriction

The goals we have set before ourselves in the economic, the political social and ideological fields make India today a land of expansion and hope. The sheer achievement, what India has done since independence, is remarkable from many points of view

New Ideas

Factionalism arises whenever people lose their sense of justice and fair play Conservatism is another name for the loss of intellectual resilience One aspect of this conservatism is the tendency to resist new ideas The other is an unintelligent adherence to old beliefs and customs even when they have outlived their utility

The most undesirable effect of this growth of conservatism is the loss of the scientific spirit among the Indian people Babar when he first came to India was intrigued and puzzled by the intellectual apathy of the masses in a country where individuals showed such extraordinary intellectual acumen

The loss of the spirit of questioning and rebellion has dulled the edge of the Indian intellect. The result is intellectual moral and spiritual stagnation The loss of intellectual resilience has led to a weakening of the moral fibre. Once a people give up the pursuit of truth for its own sake they become wordly-wise in a narrow sense In such a context, selfish considerations tend to overpower national interests It was because of this deterioration in the national character that a handful of the British had subjugated India and held her under domination for almost two centuries

British domination over India has been responsible for many evils in our life It has however, rendered one great service by challenging the old systems of belief and fostering the growth of a new intellectual curiosity The Western system of education and acquaintance with the English language and literature are perhaps the greatest gift that the British p ople brought to India. Together they opened out new horizons of thought and experience to the Indian people.

British literary and political ideas had a tremendous impact on the Indian mind and inculcated a new emphasis on individual liberty and constitutional rights Western education brought the Indian mind into touch with the scientific temper of the Western world There was initially a loss of balance and some Indians, dazzled by the achievements of the West sought to forget their own past. This was however a temporary phase and soon the study of Western modes of thought revived interest in the study of our own heritage Discovery of the West thus led to a re discovery of the East

Forces of Reaction

Once the Indian mind regained its resilience it could no longer be circumscribed by the forces of reaction Not that all Indians became free all at once Even today the forces of reaction are powerful over large sections of the people but the most vigorous elements in the nation broke the old shackles of conservatism The attainment of political liberty thus became merely a question of time

It is significant that India s greatest political figures have also been pioneers in her intellectual renaissance

Throughout her long history India has sought to combine the valu s of many civilizations and many cultures We discovered our heritage in the effort to gain the freedom of the Western world. India has thus be-

come the inheritor of the traditions of East and West. In the days of her glory India was remarkable for her power of assimilating values from many sources It is only when her life became stagnant that she lost the capacity of assimilation and synthesis The impact of the West has revived her intellectual energy If this energy is maintained and we accept new values with enthusiasm and discrimination, we can confidently look forward to a new flowering of the Indian genius

Perhaps the greatest value the modern university has contributed to the youth of India is the development of intellectual resilience and a spirit of scientific inquiry Their attitude towards innovations explained why some people have prospered while others have faded from the pages of history Today the willingness and the capacity to accept new challenges are conditions not merely for progress and prosperity but for very survival

Communication Media

Increasing use of mass media of communication has not only accelerated the movement of ideas but also increased enormously the volume of their pressure Neither physical nor mental isolation is possible in the modern wor'd Any attempt as shutting our windows and denying the impact of the outside world is fraught with danger to the wel fare of the country and the nation

The educated young men and women of India are fortunate for they have inherited the traditions of both East and West They can repudiate any part of their heritage only at their peril. This is perhaps the g eatest value which education in modern universities has brought to the youth of the country

The challenge which awaits them is to translate into reality the ideas and ideals they have thus inherited The synthesis of opposites have been one of the major achievements of Indian culture in the periods of its vitality The synthesis of opposites on a far greater scale is the task which faces the Indian-youth of today

One of the most significant symbols of our attempt to reconstruct our national life is to be found in the two Five Year Plans we have framed This is not the occa sion to attempt a detailed analysis of their nature and scope but one may point out that their chief merit arose out of their combination of economic means and social One feature of this is the judicious of emphasis between heavy industries and consumer goods industries There will always be scope for difference of opinion about the balance between them. There is also a marked difference in approach to the problem in democratic and Commun ist countries

Free Enterprise

In free enterprise economies the balance is achieved through the competing claims of different demands on available resources and is continually shifting The results are not always happy because the prospects of profits are not always commensurate with the needs of social welfare That is one reason why no economy is today left completely to free enterprise. Some governmental control in the allocation of resources is found even in a country like the U S.A

At the other extreme countries like the Soviet Union have determined the allocation of resources between heavy industries and consumer goods industries on considerations which often sacrifice the present to the future Many of the stresses which have in recent years developed in the Soviet Union and Eastern Europe are due to this dispropor tionate bias towards heavy industries This has kept the standard of life artificially low and at times deprived people of even necessary consumer goods

The Indian Plan has sought to avoid both extremes Even Communist economists have recognized the superiority of the Indian Plan and hailed it as worthy of emulation by other countries

The second great merit of the Indian Plan is derived from its practical and pragmatic approach It had not proceeded on any doctrinaire basis but sought to combine in judicious proportions public and private enter prise in the development of the nation s economic life The concept of a mixed economy has till now paid India good dividends One of the major causes for the su cess of the first Plan is the contribution of the private sector It is also generally recognized that in spite of the steady expansion of the public sector the private sector will continue to play an important role in the Indian economy

Mixed Pattern

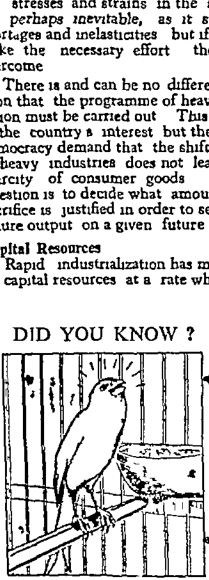
The Indian pattern is thus mixed in a double sense It is a judicious mixture of development between heavy industries and consumer goods industries and between public and private enterprise.

That the Indian Plan is mixed in a double sense has followed from our decision to accept

democracy as our pattern of government Our Plan has attempted to carry out national economic development not through ukases and dictation but through persuasion and co-operation Our aim throughout has been to harness public enthusiasm and support for all our development programmes The existence of unused reserve capacity in the economy may have been one reason for the absence of any strain during the first Plan but the major factor responsible for its success was its democratic appeal Some of the stresses and strains in the second Plan *are perhaps inevitable, as it started from* shortages and inelasticities but if the people make the necessary effort these can be overcome

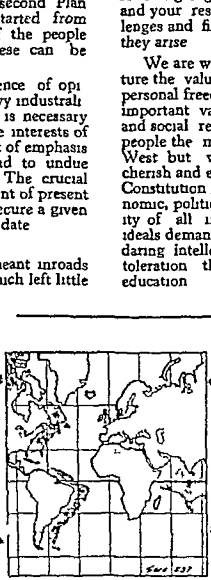
There is and can be no difference of opinion that the programme of heavy industrialization must be carried out This is necessary in the country's interest but the interests of democracy demand that the shift of emphasis to heavy industries does not lead to undue scarcity of consumer goods The crucial question is to decide what amount of present sacrifice is justified in order to secure a given future output on a given future date

Capital Resources



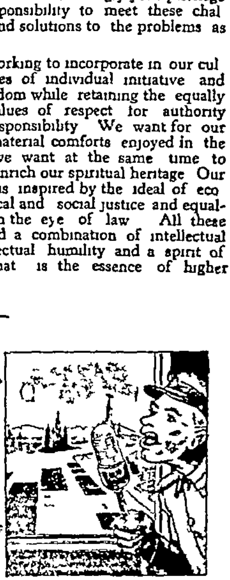
Rapid industrialization has meant inroads on capital resources at a rate which left little surplus resources for investment in the sector of consumer industries This explains why our second Plan has tried to meet the demand of consumer goods with the least possible fresh capital investment In principle this is a correct decision but we have to weigh carefully if the allocation of resources for the purpose has given enough consideration to the urgency of meeting the growing demand for consumer goods without a time lag

I have placed these thoughts before you for it is going to be increasingly your privilege and your responsibility to meet these challenges and find solutions to the problems as they arise



We are working to incorporate in our culture the values of individual initiative and personal freedom while retaining the equally important values of respect for authority and social responsibility We want for our people the material comforts enjoyed in the West but we want at the same time to cherish and enrich our spiritual heritage Our Constitution is inspired by the ideal of economic, political and social justice and equality of all in the eye of law All these ideals demand a combination of intellectual daring intellectual humility and a spirit of toleration that is the essence of higher education

---



DID YOU KNOW ?

Authorities say the feathers of a yellow canary will turn red if the bird is fed paprika

Scientific studies conducted in the International Geophysical Year reveal at one time the United States and Europe were 1 000 miles closer together, and that India was once south of the equator

The purpose of the Soviet Union's propaganda line Ban the bomb is clear to achieve prohibition of nuclear weapons and remove the Free World's only effective counter against Soviet superiority in manpower and conventional

The Commonwealth Parliamentary Association

For more than 45 years the organization now known as the Commonwealth Parliamentary Association has provided in its own field of activity some of the informal links which maintain understanding and concord amongst the peoples of the Commonwealth. The Association claims credit for no specific constitutional change, no far reaching legislative enactment, not even so much as a resounding resolution yet it has played a genuine and valuable part in the development of ideas about and within the Commonwealth.

Through the facilities it offers the various legislators can obtain the necessary knowledge and understanding of each other and of each other's problems without which no common approach is possible. They can confer frankly as with members of the same family and take back with them to their own lands the fruits of experience they have gathered which in the course of their normal Parliamentary duties, they can distribute among their colleagues and constituents. By these means throughout the entire Commonwealth a certain common background of thought and opinion can be created.

General Council

The work involved in the Association's activities formerly undertaken for the most part by the United Kingdom Branch was felt after the second World War to be properly the affair of the whole Association and constitutional changes in the Commonwealth also suggested the need for some central organization to act as a liaison body. At the Conference held in London in October 1948 it was agreed that a General Council should be formed and that the name of the organization should be changed from the Empire to the Commonwealth Parliamentary Association. These proposals having received the approval of the Branches the General Council duly met in Ottawa at the end of April 1949.

The Council's most important task at this meeting was to prepare the draft of a new Constitution which when approved would replace the Constitution of 1911. Of special note among the proposals discussed and passed was the recommendation that the delegates to a Commonwealth Parliamentary Conference should form a General Meeting of the Association when convened for this purpose and should be so convened whenever a Commonwealth Parliamentary Conference took place. It was the unanimous wish of the Council that its Headquarters should be in London and, if possible within the Palace of Westminster, and the Council was accordingly established in offices which are separate from but in close contact with those of the United Kingdom Branch. The Council's rooms are now the headquarters of the 60 branches of the Association and provide a centre for the issue of publications, the organization of conferences and for research and information on current Commonwealth affairs for members of all branches.

The new constitution was finally approved in November 1950. Some further amendments have since been approved by the General Meetings of 1952 and 1954.

Membership and Activities

The Association comprises Main Branches, State and Provincial Branches, Auxiliary Branches, Territorial Branches, Affiliated Branches, and Subsidiary Branches.

A member of any legislature where a branch has been formed is entitled to become a member of the Association without election on the payment of a subscription in those cases where the branch has decided that members shall pay individual subscriptions. Where branches are formed by resolutions of the respective legislatures and no individual subscription is imposed, a member of such a legislature becomes a member of the Association on the passage of the resolution. Members ceasing to belong to a legislature may on application become Honorary Members or Associates.

A free regular supply of information is contained in the three quarterly publications of the Association the *Journal of the Parliaments of the Commonwealth*, the *Report on Foreign Affairs* and the *Summary of Congressional Proceedings USA*. The *Journal* gives in summarized form the debates during the previous three months, in the various Parliaments of the Commonwealth on any matters likely to be of particular interest to members. The *Report* is a factual account contributed by experts on the affairs of the various countries concerned of events in those countries. The *Summary of Congressional* procedings is a digest of those debates in the Congress of the United States which have special interest for the Commonwealth.

It is not the custom of the Association's conference which so far as practicable is held every two years to adopt resolutions although a consensus of opinion frequently emerges during discussions.

THE HISTORY AND SERVICES OF

MILITARY COLLEGE, DEHRA DUN

With the growing demand after the first World War for the introduction of military training in India, the then Government of India realized the need for an institution to train the right type of material chosen from among young Indians for commissioned ranks in the Army The Military College, Dehra Dun, which celebrated its Silver Jubilee in December 1957, owes its genesis to this neces sity and naturally takes pride of place among the many training establishments of the Armed Forces of the country

The evolution of Indianisation of our Army is part of the history of India s struggle for freedom and the Military College has pl yed a significant role in this Before 1918, Indians were not eligible to hold the King s commis sions. At the beginning of the century however Lord Curzon the then Viceroy, established the first Imperial Cadet College and raised what was called the Indian Cadet Corps The aim of this corps was to impart military training to young Princes of Indian States who, after training were allowed to wear Army badges of rank. This College was however, disbanded in 1914 on the outbreak of World War I

The Cadet College was however restarted with the objective of providing preparatory training for commissioned ranks in the Army The Duke of Windsor the then Prince of Wales who visited India in 1922, opened this institution named after him as the Prince of Wales Royal Military College Dehra Dun It has since been renamed as the 'Sainik School It will not be out of place to mention that Gen. K S Thimayya the present Chief of the Army Staff was among the first batch that joined this institution in 1922

Indianisation of Army

As can be seen the Sainik School only trained cadets for entry into the Royal Military College Sandhurst before receiving commission This however did not satisfy Indian aspirations. The Montague Chelmsford re forms contained a reference to the problem of Indianisation of the higher ranks of the Army focussing attention on the urgency of the problem

The question was repeatedly raised in the Legislative Assembly in the form of resolutions demanding *inter alia* that at least 25 per cent of the King s commissions granted every year should be given to Indian subjects to start with, that adequate facilities should be provided in India for the preliminary train ing of Indians and that steps should be taken to establish in India a military training college such as the one at Sandhurst

For over 50 years national leaders insistantly demanded that Indians should be given opportunities of service in the Army at par with those enjoyed by Britons but this demand met with no substantial response from Government It is true that in 1905 success ful Indian young men of the Imperial Cadet Corps were given a special form of the King s commission in the Indian land forces, but this commission carried only the power of command over Indian troops As they could not rise above the position of a company officer in a regimental unit they had no effective military career open to them

King's Commissions

A slight advance in this position was recorded in 1918 As a result of the notable part played by India in World War I Indians were declared eligible, on equal terms with Britons to receive the King s commissions only in the land forces which carried with it the power of command over British as well as Indian troops. Even while the war was on, a Cadet School with accommodation for 50 cadets was opened at Indore in October 1919 In addition ten vacancies per annum were allotted to Indians in the Royal Military College at Sandhurst The Indore school was, however closed within a year after 39 cadets out of 49 admitted were commissioned

Thus in a nutshell the position was that up to the close of World War I Indians were not eligible to hold the King s commission, i e the commission which was held by the British officers of the British as well as Indian Armies existing in India in those days Nationalist intelligentsia including moderate element, remained dissatisfied and continued agitation while the British in India carried on experiments giving concessions here and there.

Skeen Committee

At long last on March 14 1925, during the budget discussion in the Legislative Assembly, Sir Alexander Muddiman on behalf of a committee to examine the means of attracting the best qualified Indian youth to a military career and of giving them suitable military education Lt. Gen. Sir Skeen, Chief of the General

13 man committee known as the Indian Sandhurst Committee which was set up in June 1925 to include Pandit Moti Lal Nehru and Mr. M.A. Jinnah

The terms of reference of the Committee, as finally framed by the Government of India, were as follows —

(a) By what means it may be possible to improve upon the present supply of Indian candidates for the King's commission, both in regard to number and quality

(b) Whether it is desirable and practicable to establish a Military College in India to train Indians for the commissioned ranks of the Indian Army

(c) If the answer to (b) is in the affirmative how soon should the scheme be initiated and what steps should be taken to carry it out.

(d) Whether if a Military College is established in India, it should supersede or be supplemented by Sandhurst and Woolwich so far as the training of Indians for the commissioned ranks of the Indian Army is concerned

The Committee after a series of preliminary discussions in Simla in August 1925, examined a number of specially chosen experts both military and civil. In the following years the Committee divided itself into two sub committees. One sub committee visited the United Kindom to study at first hand the military training institutions and the system of education which usually preceded admission to a purely military college Later it toured France Canada and the United States The second sub committee visited the various Indian universities and educational institution at Bombay Poona Madras Calcatta Banaras and Allahabad for the purpose of studying on the spot, the extent to which suitable candidates for an Army career could be found in these institutions.

Main Recommendations

The Committee finally submitted its report in April 1927 which provided the starting point for any future scheme of Indianisation Among other things the Committee made four main recommendations

(i) Firstly it recommended that the number of vacancies, then ten allotted at Sandhurst should be doubled with immediate effect. The number should be progressively increased until the establishment of a military college on the lines of Sandhurst in India.

(ii) Secondly it recommended that Indians should be made eligible for employment as King's Commissioned Officers in the Artillery, Engineers, Signals, Tank and Air Arms of the Army which were hitherto barred to Indians For this purpose they should be admitted to the Royal Air Force College Cranwell

(iii) Thirdly steps should be taken to set up in India within five years, a military college on the Sandhurst model, with a capacity for 100 cadets for a three years course and that its capacity should be increased progressively Successful cadets from the college should be granted the King's commission in the land forces

(iv) Fourthly, in order to secure the maintenance of Imperial connections in military matters, 20 vacancies should continue to be reserved for Indians at Sandhurst after the opening of the Indian military college.

It was anticipated that under the scheme proposed half of the total cadre of officers in the Indian Army would be Indians in 1952. It was however provided that steps should be taken to maintain the proportion of British recruitment required and that Indian King's Commissioned Officers trained at the Indian military college should complete their initial training in England

Notable Landmark

On December 10 1932 the Indian Military Academy was officially inaugurated at the old Railway Staff Training Institute Dehra Dun, by Field Marshal Sir Philip Chetwode then Commander in Chief of India. The Viceroy in a message hailed its opening as a 'notable landmark in the history of the Indian Army

After inspecting the pioneer cadets of the Indian Military Academy Field Marshal Chetwode addressed the distinguished gathering assembled in the historic Chetwode Hall. He described the I.M.A as an Indian institution for Indians open to Indians and in no way inferior to the corresponding institution in England

GREENWICH OBSEVATORY

By JENNIFER GILL

Greenwich Observatory the chief timekeeping centre of the world is now located in a fifteenth century castle in Sussex The Observatory as befits its key position is making its contribution to the International Geophysical Year the vast co-operative study of the earth and the sun in which scientists of more than 60 nations are taking part

Since time began man has studied the stars At first this study was mainly concerned with predicting the fate of peoples and nations Later it led to the accurate establishment of time, which was essential to the science of navigation

England s first great contribution to naviga tion was the founding by Charles II in 1675 of the Royal Observatory at Greenwich

John Flamsteed a wellknown astronomer of the day argued that the accurate measure ment of longitude at sea was difficult because of the inaccurate charting of the heavenly bodies Charles founded the Greenwich Observatory and made Flamsteed Astronomer Royal, the first to occupy this distinguished position

The regular observations instituted by Flamsteed have been continued ever since forming the basis of the tables in the Nautical Almanac, which was first published in 1767 These tables give the changing positions throughout each year of the sun, moon stars and planets

In 1884, when international agreement was sought on the selection of a zero or prime meridian from which the longitudes of all places should be measured the meridian through the Transit Circle of the Royal Observatory at Greenwich was chosen This set the seal upon Greenwich s fame as a world centre of astronomy and nautical science

G.M.T

Longitude, which is the distance west or east of the prime meridian at Greenwich, is equivalent to the difference in time between local time and Greenwich Time To this day Greenwich Mean Time (G.M T) is used throughout the world as a standard Countries many thousands of miles distant from Green wich receive the time signal and add or subtract so many hours to give their local mean time, according to the amount by which they are east or west of Greenwich

As might be expected Greenwich posses ses the most accurate clocks that human ingenuity can devise clocks capable of keeping time to within a hundredth of a second a day

When the Royal Observatory was founded, Greenwich was a village in open country, several miles from London. Because of the clarity of the atmosphere it was an excellent position from which to study the stars But since those days London has grown so large that its outskirts have engulfed and spread far beyond the once small village of Greenwich With the growth of London there was a deteri oration in the conditions for astronomical observations at Greenwich, and the widespread installation of bright street lighting finally made it impossible to carry on the work for which the Observatory was esta blished

After much consideration Herstmonceux Castle in Sussex with about 370 acres of ground was chosen as the new home for the Royal Observatory The castle and grounds were bought by the Admiralty under whose control the Observatory comes In the grounds there is ample room to house the great telescopes necessary to the work carried out by the Royal Observatory

The removal of the Observatory from Greenwich to Sussex began in 1948 and its name was changed with Royal approval from the Royal Observatory Greenwich to the Royal Greenwich Obsevatory, Herstmonceux

The task of rebuilding the old and instal ling the new telescopes will not be completed until about 1960 but it is now possible to carry out the work of the observatory in many of the sect ons that have been rehoused in the castle

No change in the prime meridian has result d from the move The longitude of the new site has been determined by special observations made simultaneously at Green wich and Herstmonceux

In the Meridian group of telescopes the Cooke Reversible Transit Circle which for merly stood near the prime meridian at Greenwich is fully installed and working it swings on an east to west axis and through it stars on the meridian are observed Also in this group the Photographic Zenith Tube takes pictures of the stars in the zenith Measurements are taken from the pictures and time subsequently calculated

Solar Dome

The Solar Dome, with its photoheliograph and spectrohelioscopes has already started to operate During this International Geophysical Year pictures are being taken of the sun in the light of hydrogen daily every three minutes between 14 00 hours and 16 00 hours This in conjunction with the work of observatories throughout the world is intended to produce a complete twenty four hour record of the sun s activities

Another aspect of the work carried out in the Solar Dome is the study of sunspots which cause interference to radio and television transmissions The work will undoubtedly prove useful to broadcasting organisations throughout the world

One of the main groups of telescopes the Equatorial Group, is not yet completed The domes at present under construction will house the giant telescopes There will be six domes with laboratories, darkrooms and other accommodation

Herstmonceux Castle was built in the fifteenth century by Sir Roger de Fiennes Treasurer to the Household of Henry VI It is built with Flemish bricks and is one of the finest early brick buildings in Britain

The castle fell into ruin, but in 1909 it was bought by a Colonel Lowther, who started to rebuild it He died within a short time and his work was continued by Sir Paul Latham who eventually sold Herstmonceux to the Admiralty The interior of the castle has been reconstructed with staircases beams and panelling from other old houses of the period that have been demolished

The castle itself is mainly used as offices and the residence of the present Astronomer Royal Work is carried out on repairing and regulating ships chronometers and watches used by airmen and sailors This is a major part of the observatory s work as it is the only place in Britain equipped to repair instruments requiring such accurate adjustment

Herstmonceux Castle at present is not open to the public, although the Astronomer Royal stated recently that it is hoped to admit people to certain parts of the Observatory in the near future. On certain days of the week during the summer the lovely grounds and garden of this famous Observatory in a castle may be visited

***

KING S COLOURS PRESERVED AS RELICS

When India became a sovereign democratic republic on January 26, 1950, the symbolism of the old regime inevitably gave place to the new Consequently, 'Royal prefixes in the names of the various arms and services of the Army, the Navy and the Air Force were dropped It was also no longer considered appropriate by the Navy to carry the Colours of the British monarch

Therefore, with due regard to their historic significance the King s Colours—awarded during the course of India s association with Great Britain—were laid up at the Military College (then National Defence Academy) in November of the same year, at a solemn but dignified military ceremony The 35 Colours, including those of the Navy, laid to rest now decorate the beautiful Chetwode Hall of the College.

The bestowal of the King s Colours was a recognition of group heroism and bravery as distinguished from deeds of personal valour and acts of individual courage and daring It was a mark of signal honour to regiments which coming from the finest fighting stock in the country, excelled in action as a whole. For over a century these Colours were carried in action by these units, along with their regimental colours and many a soldier sacrificed his life defending their honour and preventing them from falling into enemy hands Though modern warfare rendered their display in action inexpedient they continued for long to occupy a permanent place on ceremonial occasion.

The laying up of the King s Colours, however in no way took away from the famous regiments their achievements—in fact, they will remain sacred relics of the past handed down for their successors to maintain and enhance the traditions of valour and bravery they had inherited Preserved at the Military College they will continue to inspire future generations of young Army officers with all that is best and noblest in the profession of soldiering

Similarly at a subsequent ceremony held in April 1956, further 17 Colours belonging to the State Forces were laid up in the Chetwode Hall following their integration into the Indian Army

PRATAPGAD FORT

(By AUGUSTUS L. D'SOUZA)

On November 30 1957 India s Prime Minister Mr Nehru unveiled a huge equ strian statue of Shivaji at the historic fort of Pratapgad near Mahablehshwar The following article g ves the background of the historic event

The history of the rise of the Maratha power is fascinating and never fails to arouse the interest of every patriotic Indian. It would, therefore be most appropriate to review in brief the stirring incidents connect ed with the fortress of Pratapgad the site chosen for the memorial

Pratapgad is situated in the north western corner of Satara district (Bombay State) near the Mahableshwar plateau This holiday resort was in the time of Shivaji a trackless jungle, except for the village now known as Old Mahableshwar

Here five rivers are supposed to rise the Krishna Yenna Koyna Gayatri and Savitri the first three flowing eastwards and the last two flowing westwards The sources of rivers are considered sacred in India so the spot is hallowed and devout people claim that they can see every twelve years a sixth river, namely the majestic Ganges paying a visit to her southern sisters

In the days of Shivaji however the impor tance of the area lay not in Mahableshwar, but in the town of Javli A Maratha family belonging to the More family ruled this whole area. The chief was known as the Raja of Javli he held his kingdom as a fief from Adil Shah of Bijapur who had conferred on him the title of Chandra Rao to be held in perpetuity

When Shivaji was a boy, it is said that his mother had taken him on a pilgrimage to Mahableshwar; on seeing the beautiful daugh ters of Chandra Rao More, she had asked for the hand of one of them for her son but the haughty Maratha had refused, and this insult rankled deep in the hearts of mother and son

Chandra Rao must be humbled and his fief annexed So in 1656 when Shivaji had be come the master of the Poona district and of the Konkan he sent a message to More de manding that he should join the revolt against Bijapur

More refused he even allowed Baji Shamraj, the crafty agent of Bijapur to use his fief as a base from which to surprise and trap Shivaji The plot failed and then Shivaji went in person to Chandra Rao and sought to win him over by appeal to patriotism and religion

During the interview the insolent Raja tried to seize Shivaji to hand him over to Bija pur, but Shivaji broke loose from his hold and escaped Two agents, Raghunath Ballal and Sambhaji Kavji were then sent by Shivaji to interview More, and during the interview he and his brother were both killed, the mur- derers escaping An assault was then deliver- ed on Javli

Javli was annexed and the More retainers enlisted in Shivaji s Army Part of the Javli treasure was given to the temple at Maha bleshwar and part used to build a fort, which was named Pratapgad

Challenge

A legend persists that the goddess Bhavani herself had appeared to Shivaji when he con templated building a temple for her at Rairi and had demanded that he should build in the Javli kingdom a temple for her and a fort for him

The spot chosen by the goddess did in finite credit to her judgment for the moun- tain rock on which Pratapgad stands was impregnable besides it commanded the only pass through which the Bijapuri soldiers could march from the Krishna valley to invade the Konkan

The events related above occurred in 1656 Three years later Shivaji was faced with a very great danger Adil Shah of Bijapur was by now thoroughly roused The barons whom Shivaji had most unceremoniously ousted from their fiefs thronged the court of Bijapur clamouring for revenge.

But who would bell the cat ? General after general declined the honour until in a spirit of bravado Afzal Khan the king s cousin and a seasoned campaigner declared that he would bring the ' mountain rat alive to the court of Bijapur A mighty expedition consisting of over 10 000 picked troops was equipped and proceeded to Pratapgad within whose im pregnable walls, Shivaji had massed his troops

As Afzal marched omen after omen is believed to have warned him of his fate. More serious than

the difficulty of maintaining and feeding his immense army, for the late war with Auran gzeb had drained the treasury of Bijapur

But a source of wealth was available which a man like Afzal had no scruple to tap The Hindu temples at Tuljapur and Pandharpur were rich with the accumulated wealth of cen turies Afzal s soldiers entered, looted and desecrated them.

At Tuljapur, the priests of Bhavani manag ed to save the goddess from insult by removing her idol from the temple but Afzal satiat ed his wrath by killing a cow and sprinkling its blood within its sacred walls

These and similar acts infuriated the Hindu populace and the Maratha War of liberation now assumed the aspect of a re ligious crusade

When Afzal in the name of his master called on all the Maratha jagirdars and desh mukhs to join him against the rebel Shivaji, hardly a few could be found to be tray the national cause One by one they rallied to Shivaji s banner to seal perhaps with their life s blood their zeal for the cause of Maratha freedom

The 'Bhagwa Jhanda fluttered proudly over Pratapgad ! Within the walls of this fort stood the flower of the Maratha nation

Relinquishing his command in the Konkan Moro Pant that master of strategy arrived likewise, riding as fast as his horse could carry him came the dashing Netaji Master of Horse and C in-C of the army of the Ghats

Besides Shivaji stood the gallant Tanaji Malasure Baji Prabhu and Murar Baji all destined one day to achieve immortal fame Stout hearts sinewy muscles and unflinching courage thus more than made up for lack of armaments

Far far below the fortress in the village of Wai were pitched the tents of Bijapur Afzal had mounted troopers heavily accoutred and huge cannon, well loaded But alas! the horse could not scale nor could the cannon be drag ged up the hill that leads to Pratapgad

Thus the armies waited, one on the inaccessible heights, the other on the plains below glaring at each other

Message

At last, one day there entered the fort of Pratapgad a Brahmin named Krishnaji Bhaskar he was the envoy of Afzal and he carried the following message to Shivaji.

Your father has long been a great friend and you are therefore no stranger to me. Come and see me, and I shall use my influence to make Adil Shah confirm your possession of the Konkan and the forts you now hold I shall secure for you further distinctions and military equipment from our Government If you wish to attend Court you will be welcomed Or if you want to be excused personal attendance there, you will be exempted '

Imagine the flutter and excitement caused by such a message ! A council was called. Arguments after arguments were advanced for or against accepting the offer The majority in the Council begged of Shivaji to make peace But the course appeared ignoble to him and he pondered long

He was faced with the greatest crisis of his life. Should he tamely surrender at best he would be a humble vassal of the hated court of Bijapur at worst a prisoner in a dungeon perhaps maimed and blinded, after the fashion of the times

Should he on the contrary resist he might have to stand an isolated rebel like Rana Pratap of old spending his whole life hiding in the hills and hunted like a wild beast Care ful thought was needed—and prayers to Bhavani. The council was dismissed and for a night Shivaji pondered

A legend tells us that the goddess Bhavani appeared to him and demanded that he should boldly confront Afzal and that all would go well Shivaji s mind was made up

One dark night, Afzal s envoy Krishnaji was startled to see a man creeping into his tent. The man was Shivaji come to appeal to the envoy to reveal whether Afzal meant trea chery

Passionately and yet respectfully Shivaji pleaded that all he had done was to protect kine and Brahmins, that Bhavani herself was on his side that it became a Hindu and a Brahmin at that to tell him the truth finally that Krishnaji need not fear Afzal but could at any time come over to Shivaji, where he could live among his own people Krishnaji yielded and Shivaji got the knowledge he sought.

Interview

Just below the foot of Pratapgad is a little piece of tableland, the crest of an eminence. This was the place chosen for the interview A tent was pitched and richly decorated

Inside a wooden platform was constructed A path leading to the tableland was then clear ed by Shivaji s hillmen Having supervised these arrangements, Krishnaji returned to his

master, accompanied by Shivaji s envoy, the Brahmin Gopinath

After a little preliminary wrangling Afzal Khan agreed to meet Shivaji at the spot which the latter had prepared for him On 10th November 1656 eight men stood inside the tent the principals Shivaji and Afzal the two seconds of each leader and the two Brahmins Only Shivaji and Afzal ascended the plat form

What exactly followed will always remain a mystery The question who struck the first blow will be disputed with passion and heat

But the result is known to all In a few minutes Afzal was dead his bowels ripped open with the tiger s claws and a bichwa in his back. A general scuffle then followed

Outside the tent Sayyid Banda Bijapur s ace swordsman was standing Shivaji had in sisted that he be kept outside Now on hear ing the noise, the soldier rushed in and fell on Shivaji but the latter made short work of him

Afzal s two seconds realising that they had lost, put their wounded master in a palki and tried to rush down the hill with him But their legs were slashed the palki halted and the head of Afzal severed from his body, was carried in triumph to Pratapgad

From the ramparts there was then heard the deafening roar of the cannon The echoes reverberated around the hills This was the signal for which Netaji and Moro Pant were waiting

On Shivaji s orders they had placed their men in ambush all around the camp of Afzal As the report of the cannon reached them they rushed like mad fury on the leaderless camp

For three hours the army of Bijapur made a desperate stand But the surprise had been too great and they were forced to yield Rout

Three thousand were killed and the rest taken prisoners All the equipment ammuni tion horses camels and elephants besides 10 lakhs of rupees in cash and jewellery fell into the hands of the Marathas Thus by one deft stroke Shivaji had succeeded in freeing his country from the invader

The sword with which Afzal had tried to hack Shivaji to death has been preserved as a trophy by Shivaji s descendants The gold headed pole which supported the historic tent now adorns the temple of Mahableshwar The headless body of Afzal was buried with respect on the side of the hill and over it a tomb was erected, which may be seen even today

The fate of Afzal stirred the hearts and minds of the Marathas in a most profound manner Ballads were composed in martial verse to celebrate the event, and throughout the Maratha country princes and peasants crowded to hear the minstrel recite how Shivaji the Great had destroyed the enemy, who had ravaged their homes and desecrated the temples of their gods

DO YOU KNOW ?

Training Mercantile Marine Personnel

On the expert advice of a special committee appointed in 1948 the Government of India reorganised in 1949 the system of pre sea training on the T S Dufferin reserving it wholly for training of Deck Officers and setting up a separate training establishment for providing pre sea training on the engineer-ing side under the Directorate of Marine Engineering Training

As against an annual output of 25 Deck cadets and 25 engineering apprentices from Dufferin in the period prior to the reorgani sation at present 50 boys pass out every year from each of these two seperate institutions

A Nautical and Engineering College was also set up at Bombay in 1949 to provide ad vanced post sea technical instruction Train-ing is imparted in this College on navigation as well as in Engineering Up to the end of December 1956 more than 3 500 Merchant Navy Officers have availed themselves of the facilities offered at the College

Two training establishments the T S Bhadra in Calcutta and the T S Mekhala in Visakhapatnam were set up in 1950 and 1951 respectively for training Merchant Navy ratings Third such institution, the T S Nau Lakshi at Navlakhi was added in 1955

The total annual output of these three institutions is at present 1 680 trained ratings who are helped to get employment in ships through the Seamen s Employment Offices set up in Bombay and Calcutta

India has been one of the largest suppliers of maritime labour and over 75 per cent of the seamen engaged at Indian ports serve non Indian ships

PLANNING FOR PROSPERITY

By Mr V T KRISHNAMACHARI
(Deputy Chairman Planning Commission)

The people should be made to feel that the second Five Year Plan is theirs and that they should make united efforts to ensure its success

This is the challenge we have to face What we need above all is thousands of dedicated men and women in all parts of the country who will rally the people to the support of the Plan and all it stands for and obtain their willing response to the sacrifies they have to make for raising their own standards of living

The question we want to ask ourselves is this Are we evoking the willing and enthusiastic co operation of the millions in the country — persuading them to put forward united efforts — on the scale that is essential for achieving the goal we have set before ourselves? What further steps should we take to strengthen the forces of co-operation so that every family willingly undergoes all the sacrifices needed for our Plans?

Our objectives are very modest We seek to raise *per capita* national income from Rs 281 to Rs 546 after 20 years In the Second Plan our aim is to increase *per capita* national income from Rs 281 to Rs 331 There are only a few countries in the world in which the present *per capita* income is what we expect to achieve at the end of our fifth plan

As for the creation of employment opportunities — if we carry out the second Plan successfully we expect to absorb in gainful occupations 8 to 10 million persons This represents only the additions that will accrue to the population in the five year period No impression will be made on the existing backlog in employment For achieving even these limited objectives the country has to carry out a five-year programme estimated at the time the Plan was prepared to cost about Rs 7 100 crores — Rs 4 800 crores in the public sector and the rest in the private sector Since then prices have increased and costs of projects have increased

When presenting the Plan to the National Development Council, the Planning Commission laid special stress on the conditions that in its view should be fulfilled for the successful implementation of a plan of the magnitude proposed I should like to set these briefly

INCREASED PRODUCTION

In the first place there should be increased production, especially agricultural production The Planning Commission considered that the increase in agricultural production should be of the order of 40 per cent at the end of the Plan period so that besides meeting the country s needs exports might be built up during the later years of the Plan to assist the foreign exchange position

Secondly special efforts should be made to increase the internal resources available for the Plan In particular there should be an intensive drive for small savings organized so as to reach every family in the country

Thirdly, a level of prices should be maintained which would be fair to producers and consumers and will ensure that the development programmes can be carried out without setting in motion inflationary trends

As regards agricultural production, the Planning Commission had a series of talks with State Governments as the result of which they have agreed to increases of the order of about 80 per cent Broadly speaking the programmes are for systematic utilization of irrigation facilities — already created and to be created in the coming years — and the adoption of improved techniques of agriculture like the use of approved seeds fertilizers organic and green manures etc

OWN PLAN FOR VILLAGE

In every village a village panchayat and co-operative should be set up through which it will be ensured that every family will have a plan for increasing agricultural production for which it will be assisted Every village will thus have its own plan and set up for itself standards of performance for which the panchayat and the co-operative will accept responsibility Generally speaking the programmes I have mentioned are gaining momentum in the current year but there is in every State much leeway to make up in the remaining years of the Plan

In industrial production the results have been encouraging and with increases in agricultural production there will be a further impetus to industrial production.

FINANCIAL RESOURCES

I now come to the question of financial

resources I do not propose to speak on taxation policies in the Centre and in the States The additional taxation meaures of the Central Government are familiar to all of us Individual State Governments have programmes of taxation to which they are giving effect

There are however aspects of this subject which I feel I should mention The Taxation Inquiry Commission has referred to the large-scale evasion that takes place in income tax and sales taxes It is hoped that public opinion will assert itself strongly against these evasions and that the administrations will become more and more effective in their methods of checking them

Another disquieting feature is the large arrears that have been allowed to accumulate in several States in land revenue, fertilizer and other loans and the delays that are occurring in giving effect to the schemes for the assessment and levy of betterment taxes where these have fallen due I am afraid these are taking place on a scale large enough to upset Plan calculations Here again I hope that improvement will take place as soon as possible by more efficient measures and the education of the people and of village panchayats and co-operatives in their responsibilities

SMALL SAVINGS

By far, however the most important programme we have in the field of financial resources is the organization of an intensive drive for small savings which will reach every family in the country This has now become extremely important as the programme of States loans originally envisaged cannot be carried out in the present conditions and has to be replaced by a bigger effort for small savings

On the third point about price levels it is not necessary to dilate at any length The price situation is continuing to cause serious concern The general index of wholesale prices rose by 8 3 per cen between June 1956 and June 1057 This was on top of a rise of 18 8 per cent in 1955 56 It is obvious that the Plan cannot be implemented unless the nation recognizes the need for and accepts the minimum controls called for to maintain prices which would be fair to producers and consumers and which would make possible an expanding economy

COMMUNITY PROJECTS

There is another important subject which I would like to mention In an under developed economy suffering from unemployment and under employment programmes for harnessing the unutilized energy in the countryside for carrying out works of benefit to the community are of the highest value

In the N E S and Community Project areas much is being done in this respect and *shramdan* weeks are becoming popular In the coming years these efforts should be organized with the aim of building up permanent assets for villages like irrigation works afforestation and soil conservation fuel plantations improved village pastures etc A five year programme should be prepared for each N E S block in which programmes of works for (i) individual villages (ii) groups of villages and (iii) the entire block should be prepared on a coordinated basis and each village authority should carry out its own share of this comprehensive plan

I hope that what I have said brings out the vital role of the Community Development movement Its main function is to assist people in their efforts to increase production and savings and in other ways to assume the responsibilities involved in carrying out the Plan This movement has hitherto been confined to rural areas but the methods for which it stands and its programme are capable of application to urban areas

(A I R Talk)

STEERING CLEAR OF DANGER

The Magnetic needle always points to the north, whatever the direction of the ship s sailing hence it is that the ship does not lose her course If the mind of man be always turned towards God he will steer clear of every danger — *SRI RAMAKRISHNA*

SECRETS OF THE SUN

By ARTHUR C, CLARKE

The nearest star is the sun It took the human race quite a few thousand years to discover this fact for no objects could seem more unlike than the dazzling burning sun and the coldly scintillating stars It is the sun's extreme closeness—a trifling 93 million miles—that makes the difference and makes the sun so overwhelmingly important to us

The amount of energy we receive from this nearest star is enormous roughly equivalent to a one kilowatt electric heater on every square yard of our planet s surface And the earth itself intercepts only a minute fraction of the sun's rays most of the energy goes rushing past into space Where does all this energy come from ?

In the Victorian era, a splendid battle developed between astronomers and geologists The problem was this no source of energy known to science could possibly have kept the sun going for the periods of time the geologists said the earth had existed If the sun were made of coal for example it would have burnt itself out in a couple of thousand years The astronomers racked their brains and at last decided that the sun obtained its energy from its slow contraction under gravity

But if the sun were contracting, it must once have been bigger and calculations showed that 50 million years earlier it would have embraced the earth This obviously set a limit to the age of the earth Geologists pointed out however that 50 100 even 500 million years were not long enough for the changes our planet has seen—mountains worn away chalk beds miles thick that had been laid down on the beds of vanished seas They told the astronomers to look for a few more *noughts*

Not until the discovery of radioactivity did astronomers realize that gigantic stores of energy were locked up in the atoms themselves and that the sun was able to tap that energy, which was sufficient to keep it shining for thousands of millions of years But how does the sun tap the energy of matter ?

Many of the ordinary elements are present in the sun Some elements—radium for example—are naturally unstable and continuously give over energy until they have decayed into less spendthrift substances such as lead But radium could not account for such a vast generation of power over so long a period the sun must have learnt the secret of releasing energy from ordinary matter

The first major clue to that secret came in 1868 when the newly developed spectroscope revealed an element in the sun not yet discovered on earth The new element was named ' helium , and after an intensive search it was found in our atmosphere in minute quantities

We know now that helium is the ash left when atoms of hydrogen are fused in the furnace of the sun This type of burning is infinitely fiercer than ordinary combustion it is an atomic rather than a chemical process and takes place deep within the sun under pressures and temperatures beyond imagination

Helium and hydrogen are vastly more abundant in the sun than all the other elements put together Every second about four million tons of matter are converted into energy to equal this output, we would have to explode 80 000 coal trucks full of TNT every second The released energy batters its way up to the surface of the sun, hundreds of miles above Then in the form of light, and other radiations it spreads out into space

No man has ever seen the sun or ever will Only a small part of its radiation—the narrow band of visible light—leaks down through the earth s atmosphere which filters out the ultra violet and X rays that would otherwise continually bombard us Without this protection we would all die in a few minutes from acute sunburn Much of the efforts in the building of earth satellite rockets is concerned with attempts to measure all the sun s radiations before they enter the atmosphere This work could have immediate practical consequences for the solar rays absorbed in the upper atmosphere have a great, though still unknown, effect on the weather and on shortwave radio communication. At times the sun sends out sudd n spurts of ultra violet light that causes intense elecrification of the upper air and long distance radio circuits are disrupted.

In recent years it has been possible to make motion picture films of the surface of the sun and by speeding them up several hundred times to project on the screen the life story of cataclysmic solar events which may occupy hours of time and multiple millions of cubic miles of space Some of those

films are awe inspiring they show immense fountains of glowing gases spurting to heights of a hundred thousands miles, bridges of incandescent gases which could span a dozen earths forming and crumbling exact replicas of A bomb bursts—but a thousand times as large—shooting up into space

Watching these films, you see the action of forces completely beyond our understanding A slanting jet of incandescent gas, for example, will shoot out on a long flat trajectory, reach its apex and then whip back along its original path—as if a shell at the peak of its flight decided to return to the gun And sometimes, thousands of miles above the sun s surface cascades of glowing matter will pour down from no apparent sources as if they were created high in the solar atmosphere

Since the sun is purely gaseous it is surprising that its surface is so sharply defined Seen through the telescope its edge is a perfect circle One reason for the sharpness of the sun s edge is its intense gravity 28 times that of the earth On the sun a 12-stone man would weigh over two tons

Although many stars wax and wane in brilliance, the sun s output of heat and light had changed little during the course of human history But what of the future? What will happen when the sun starts to run out of fuel about the year A D 10 000 000 000? The obvious assumption would be that the sun will gradually cool down to a dull red and finally gutter out into extinction But the obvious assumption is not the correct one The sun is not cooling down, it is warming up

As the sun uses up its hydrogen fuel and the helium "ash accumulates round its core, the rate of reaction will increase Like a gambler who bets more and more frantically as he approaches the end of his resources the sun will go out in a final blaze of glory Within a span of a mere five million years it will increase its brilliance a hundredfold melting down the earth and the inner planets into balls of glowing lava Then it will collapse swiftly to a tiny star only a few thousand miles in diameter It will still be bright, but it will give out little more heat than the full moon does today The minute star which finally gutters to extinction will not be anything we would recognize as the sun.

So at least, runs the current theory but to claim that it is an accurate description of what must happen would be rash Even when we have attained a complete understanding of the processes taking place inside the sun, we cannot be sure that external factors—clouds of interstellar dust into which it may run for example—may not write new and unexpected chapters in its history At any rate we need not worry about the sun blowing up or going out for the next few thousand years

DO YOU KNOW

Housing in India—2 (Rural)

There are at present 5,58 089 villages in India with a population of 29 5 crore and there are about 5 4 crore houses to accommodate this population

Nearly 5 0 crore such houses need be rebuilt or substantially improved

A large number of villages have to be provided with wider streets better drainage, school buildings playgrounds and community centres This will involve an expenditure running into several thousand crores of rupees

The Rural Housing scheme which has recently been announced is for this reason based on the principle of aided self help The housing programme will be mainly confined to villages in suitable Community Development and Extension Service blocks

Other conditions being favourable preference will be given to those villages the majority of whose residents are willing to improve or rebuild their houses (on aided self help) based on the master plan which will be drawn up for the village by the State Government.

The houses will be designed and built on a modest scale using local building materials procured through village co-operatives.

To conduct guide and control this programme efficiently each State Government will set up a rural housing cell This cell will prepare village lay outs evolve economic designs for individual houses having regard to the use of local materials and climatic conditions and give technical advice to the local authorities

At the centre the Ministry of Works Housing and Supply have already set up a Rural Housing Cell with the object of studying various problems in this field and co-ordinating the work of cells in the States

Ernest Hemingway: The Man and His Work

By Dr PHILIP YOUNG
(Kansas State College, U S A)

Ernest Hemingway is very probably America s most famous and influential living writer of fiction. His style his hero (that is to say the *protagonists of many of his works*, who so resemble each other that we may speak of them in the singular) his 'manner and ' attitude are very widely recognized—not just in America, but through translation in France, Italy Russia and elsewhere And everywhere his work has become recognized it has had its effect on other writers He has also a great reputation as a colourful and exciting human being and his every escapade has for over a quarter century, been duly reported in the press But neither he nor his work is as well understood as it might be and the purpose of this short account of him is to help increase the understanding of a very important and very unusual American writer

The ' key' to Hemingway, insofar as there is one, lies waiting in his first significant book It posed as a volume of short stories, and appeared in 1925 it was called *In Our Time* Very probably the author intended this title as a sardonic allusion to a phrase from the Church of England s Book of Common Prayer—' Give peace in our time O Lord At any rate the most striking thing about the volume is that there is no peace at all in the stories The next most striking thing about them (long unremarked, for some curious reason) *is that half of the stories are* devoted to the spotty but careful development of a crucial but little understood character named Nick Adams These stories are arranged in the chronological order of his boyhood and young manhood and are intimately related

The first story about Nick is called Indian Camp A close and very careful reading of this story will show that Hemingway is not primarily interested here in events He is interested *in their effect on the little boy* who witnessed the whole thing For the moment the events do not seem to *have* any effect on the boy But later on he is a very badly scared and nervous young man and here Hemingway is relating to us one of the reasons why that is so

There follow several other stories about Nick Adams and then much later in the book there is a little sketch, less than a page long, that tells us that 'Nick is in the First World War, that he has been' wounded and that he has made a ' separate peace with the enemy—*is not fighting for his country* (or any other) any more. It would be quite impossible to exaggerate the importance of this short scene in an understanding of Hemingway and his work It will be duplicated by another protagonist named Frederic Henry in the famous novel *A Farewell to Arms* and it *will serve as the high point in the lives of all* of Hemingway s heroes—one way or another—for at least the next quarter century

Nick s serious injury does two things for *In Our Time* First the wound culminates, climaxes and epitomizes the wounds he has been getting as a boy growing up in the *American Midwest And from here on* the Hemingway hero will appear to us as a wounded man—wounded not only physically but—as soon becomes clear—psychologically as well Second the fact that Nick and his friend also wounded have made a "separate peace Not patriots marks the beginning of the long break with organized society in general that last Hemingway and his hero through several books to-come, and into the late 1930s Indeed the last story in this volume, called "*Big Two Hearted River* is a kind of forecast of these things Obscure till one sees the point—and almost completely so (Hemingway complained in 1950 that the tale was 25 years old and had still not been understood by anyone)—it is really a very simple story It is the study of a young man who has been wounded in the war who is in escape of everyone all by himself on a fishing trip he is suffering from what used to be called ' shell shock he is trying desperately to keep from going out of his mind

In his next two collections of short stories *Men without Women* (1927) and *Winner Take Nothing* (1933)—Hemingway included five more stories about Nick Adams which fill *in some* of the gaps in his sketchy career, but do not substantially change the picture we have of him already He is a sensitive honest, virile 'out door young man he has a *lot of* ' nerve, and he is very ' nervous as well Soon and under other names in other books he is going to be known half the world over as the Hemingway hero for all of these men have been shaped by Nick, have had his

childhood, adolescence and young manhood He is the big, tough, outdoor man and he is also the wounded man He will die a thousand times before his death, as Shakespeare puts it, but from his wounds he will never recover as long as Hemingway lives and records his adventures

The New "Code' Hero

Now it is clear that something was needed to bind these wounds, and there is a consistent character—he also appears first in Hemingway's short stories—who has that function This figure is not Hemingway himself in disguise (which the Hemingway Hero is), indeed he is to be distinguished from the hero We generally call him the "code hero' —this because he represents a code according to which the hero, if he could learn it, would be able to live properly in a world of violence, disorder and misery The code hero introduces, then, and exemplifies certain principles of honour and courage which in a life of tension and pain make a man a man and enable him to conduct himself well in the losing battle that is life—to show, in Hemingway's famous phrase for it "grace under pressure The best and best known of these code heroes appears however, in Hemingway's most recent novel He is the old man of *The Old Man and the Sea* The point about him is that he behaves perfectly—honourably, with great courage and endurance—while losing to the sharks the gigantic fish he has caught This Hemingway seems to be saying, is life you lose of course, what counts is how you conduct yourself while you are being defeated

The three matters already discussed—the wound the break from society the code (and a working adjustment of them)—are the subjects of all of Hemingway's significant work outside the short stories This comes to ten book length pieces, six novels, a burlesque, a book on big game hunting one on bullfighting, and a play The hope is that the pattern already set up will clarify their meanings

The burlesque—a "satirical novel —came first. It was called *The Torrents of Spring* (1926) and is a parody of Sherwood Anderson's novel *Dark Laughter* (1925) It is a rather amusing performance, but it has no relation to anything else Hemingway has written it has never had many readers and we would not be justified in taking time to discuss it. However Hemingway's first novel *The Sun Also Rises* appeared later in the same year and this book re introduces us to the hero He is named Jake Barnes, and he, too, is wounded. He has also broken from society and the usual middle class ways he lives in Paris with an international group of expatriates a dissolute collection of amusing but aimless people—all of them in one way or another, blown out of the paths of ordinary life by the war

Hemingway's next book was another novel, called *A Farewell to Arms* (1929) and it explains how the characters of *The Sun Also Rises*—and the hero, particularly—got the way they are. The book is a combination of love-story and war novel In the course of it the hero now called Lt Frederic Henry, is wounded in the war as was Nick Adams (the wound is in the knee which is where Hemingway himself was most badly hit) He falls in love with an English nurse, while recuperating and when he is returned to the front he is forced to desert the army in which he has been fighting in order to save his life He escapes to Switzerland with the nurse who is now pregnant with his child, and there she dies in childbirth He is left at the end, with nothing A man is trapped Hemingway seems to be saying He is trapped biologically and he is trapped socially, either way it can only end badly and there are no other ways Once again, this is a beautifully written book The prose is clean fresh, hard and wonderful the people ring true the construction—which ties together two stories that seldom seem to mix well, love and war—is perfection. But the message again, is a desperate one.

The connection between Hemingway and his hero has always been intimate, and in view of this pessimism it is perhaps not surprising that the next two books of this author find the hero—Hemingway himself now without disguise—pretty much at the end of his rope The books are *Death in the Afternoon* (1932) and *Green Hills of Africa* (1935) and neither of them is very important

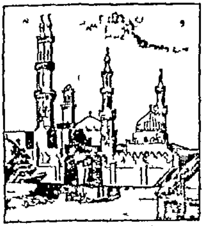
Putting the pieces back together was for Hemingway a long and painful process His next book, a novel called *To Have and Have Not* (1937) was the first big step This was not a good novel—at least not for this writer But it is a book in which its author clearly shows that he has learned something

War In Spain a Subject

It seems to have been the civil war in Spain that brought Hemingway back into the world of other people and back from his despair He fought, informally, in that war, on the Loyalist side, and his next full length

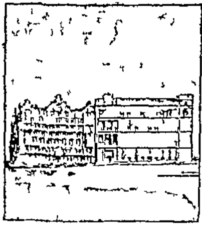
work was a play called *The Fifth Column* (1938), which praises the fighters with whom he was associated, and declares his faith in their cause The hero, who appears here as a newspaperman who is really a spy, has come a long way from the hero—so like him in every other way—who decided in *A Farewell to Arms* that such faiths and causes were "obscene

And Hemingway s next book, a novel called *For Whom the Bell Tolls* (1940), showed that he and the hero, meant what they had said The novel itself deals with three days in the life of Hemingway hero, now named Robert Jordan. He, too is fighting as an American volunteer, in the Spanish civil war He has the job of blowing up a bridge and he accomplishes it he is killed in the end



For Whom the Bell Tolls is not a flawless book, for one thing it has a rather senti mental—or at any rate a very Romantic—love story for another it contains a good deal of rather hazy political thinking which Hemingway is not particularly good at But it is a very good novel, and was his best book since *A Farewell to Arms*

Following this novel Hemingway lapsed into a silence that lasted for ten years—chiefly because of his non literary activities in the Second World War And when he broke this silence in 1950 with his next book, a novel called *Across the River and into the Trees*, the death of his once great talent was very widely advertised by the critics and reviewers.



But the critics who thought they saw the death of Hemingway s talent instead of just his hero, in this book happily proved to be very much mistaken for his next book, another novel called *The Old Man and the Sea* (1952) was almost universally accepted as a triumph and brought its author the Nobel Prize for Literature. The award was just if *somewhat belated, perhaps*

The book signalizes extraordinary change *in Hemingway—but one with a long evolution* from the days of total despair A reverence for life s struggle, and for mankind, has descended on him like the gift of grace on the religious And the knowledge that a simple man is capable of such dignity decency and even heroism as this old man possesses—and that his struggle can be seen in heroic terms—is itself perhaps the greatest victory that Hemingway has won After finishing the book its author remarked to someone. "It s as though I had gotten finally what I had been working for all my life

INDIAN WORDS IN ENGLISH LANGUAGE

By ARTHUR SOUZA-GODINHO

English is perhaps, the most receptive of languages borrowing without fuss or ado words from the farthest corners of the globe They hardly strike a jarring note, dovetailing flawlessly like an intricate pattern into the body of the language

A few weeks ago a report was published from Poona of the Bombay Government s decision to hold an annual drama festival in order to encourage the revival of the decaying *tamasha* tradition in the Poona region

Some time earlier the word *totem* also appeared in a newspaper, referring to the 125 foot high pole, erected at Victoria in British Columbia, to commemorate the 89th anniversary of Canada s confederation A few weeks later the word *loot* was used in a heading to describe an attack on a granary by a mob in Bihar

About the same time the term *taboo* figured in a report expressing the gist of a resolution passed by Burmese women opposing marriages with foreigners

The word *taboo*, of Polynesian derivation, is as good an example as any of the many terms absorbed from various languages into English, where they have thoroughly been acclimatised and efficiently serve the requirements of daily speech. They are irreplaceable and add to the expressiveness of the tongue

Perhaps the Indian languages—Hindustani Bengali Kanarese Marathi Malayalam and Tamil—have made the richest contribution to English in the modern era This fact is easily understandable in view of the long and intimate connection of the British with this country, in both a ruling and trading capacity

Thus, not only administrative but also trading terms of Indian origin have acquired through usage in commercial and official correspondence rights of full citizenship in the English language.

Today they enjoy the same status as the purest Anglo Saxon words and are not considered in any way inferior to words of Dutch French, German Norse, Italian, Latin or Greek origin.

An excellent example of an Indian word endowed with this high status is afforded by the familiar English vocable *punch*, which no amount of philological ingenuity will ever link with a Bacchic decoction specially brewed in India in the old days for some exclusively Burra Sahib s club

This nectar as those who have been fortunate enough to imbibe it will recall, was made from five ingredients, including spirits sugar and spices Hence it was called *panch* (five)

Too lazy to open his mouth sufficiently to pronounce it correctly the Englishman Anglicised the word into punch This version (corruption?) Dickens has enshrined for all time, in English literature for we find in the Pickwick Papers' that the drink so called proved so tempting to Mr Pickwick

Like punch there is another purely Indian word which has found its way into English literature Readers of Swift s Hints on Polite Conversation may recall the sentence O! miss you must give your *vardi* too The word *vardi* here has variously been explained While some believe that it is a mutilation of the French expression *par dieu* others hold that it is a distortion of verdict.

It is however quite likely that the word is the common Gujerati word vardi meaning an order and that it was imported into English polite conversation by some Anglo-Indian who had returned to England in the days of Swift two centuries ago from Surat, where the English had a factory and were firmly established in business

We are quite familiar with many such words which, in print, are not set in a distinctive type to call attention to their exotic nature. They are expressive avoiding the cumbrous periphrasis which might otherwise, have been necessary to convey effectively the intended thought or idea.

The early English explorers buccaneers traders and colonisers did not scorn, in their hauteur to enrich their own vocabulary by drawing liberally on the languages of those with whom they came into contact Territorial conquests and pecuniary aggrandisement were accompanied by philological acquisitions.

John Company

A curious process marked the absorption of Indian words by Englishmen into their vocabulary during the days of John Company for they endeavoured to discover English words bearing some sort of a resemblance to the Indian words they heard The process was, however, not one sided as the Indians did likewise

The expression *John Company* itself furnished a capital illustration of the process.

The phrase seems on the face of it, to be impeccable English but it is in reality, an almost undetectable farrago of Hindustani and English

'John C-mp-ny' was, as Stanley Lane Poole observed long ago, o iginally *Jahan Kumpany* (Company of the World) the name given by the natives of India to the United East India Company ' The vernacular phrase was expressive, and the early English traders soon Anglicised it.

Some of us might, at one time or another in either conversation or print, come across the expression "quite the cheese to refer to an object or an article that comes up to one s expectation or is of a good quality Cheese here has no connection whatsoever with the dairy product, but it is the English version of the Hindustani *chiz*, meaning something superb

This is well brought out in the common Hindi expression *koi chiz hai*, as for example when it is used to refer to a girl with a comely figure

Likewise an Indian origin is associated with the impolite word in a phrase generally considered to smack of blasphemy The final word in the phrase "Don t care a damn has no connection whatsoever with the oppro brious term damn but has been traced to dam a copper coin which was worth about a fortieth of a rupee

Striking examples of Indian words thus absorbed into English are sola topee gharry tamtom, bap-re and tinpai. Sola in the ex pression sola topee is derived from the Hindustani *shola* meaning pith

Indifferent to etymological niceties the early English residents altered sola into solar (stemming from the Latin sol—sun) in order that solar topee might suggest to their ears by sound and spelling the proper significance of a sun helmet.

Hardly a day passes without the appearance of familiar Indian words in journals published in English in our country Pick up any day s issue of such journals and we are sure to light on such words as *mahatma khadilar ahimsa sari charkha lathi, dharma, yoga,* and *harijan.* The list is by no means complete

These words have been very much to the fore in daily speech in our generation They were unceremoniously transferred to the printed page first hesitatingly as they were within marks of quotation or in italics to indicate their in with normal English words Soon this formality was dropped and the words by usage, became standard English

British Press correspondents in our country in the days of the civil disobedience movement in the early thirties had no qualms about using them in their despatches with parenthetical English equivalents—thus *lathi* explained by bludgeon and *sigree* by brazier. So the words became as familiar to the Englishman as his bacon and eggs as he pored over the morning s newspaper at breakfast.

Some of the words figuring repeatedly in news reports were used to designate weapons forged in the arsenal of non violence to cripple his business The Englishman soon learnt the meaning of the strange words he became intimate with them and he put them into circulation with the same alacrity as he did his manufactured wares for a live shopkeeper loves nothing more than to popularise the latest novelties

Frequently figuring in the vocabulary of Anglo-Indians were such words as chaprasi darzi mali bungalow sowar, khidmutgar, chota hazri. chutney punkah, gharry, jodhpurs mufti khaki puttee, shikar, ghat, jungle, khud, machan dooli mahout, gadi, chowky mugger mussuck and mahseer

Yet earlier times when the Englishman was feeling his way about the country and was primarily a trader and not an official saw him enlarge his vocabulary with words relating to persons or things he daily encountered

Absorption

To this era belong such words as Brahmin, pandit rajah nawab, zenana purdah, sadhu molvi kotwal pooja, bhang, gumlah curry mulligtawny toddy, pariah mali dharamshala mofussil loot, swastika ekka, dastoor thug bandicoot moudan charpoy and teapoy (from tinpoi) and satrangi

The number of Indian words which have thus passed into common English parlance is legion. No Englishman, however, much imbued with patriotic pride and a sense of linguistic purity, will be disposed to consider them foreign to his tongue any more than he would such words as amuck sarong and gecko (of Malayan origin) divan juleep, baksheesh and siambok (Persian) tomahawk, totem and wampun (North American Indian) canoe (Haytian hula (Hawaiian) hoodoo (Afri

(Continued on 44)

ECCENTRICITIES OF AUTHORS

By RALPH MIDDLETON

Writing a novel is in itself a difficult enough task. Yet, throughout the ages authors have taxed their ingenuity in setting themselves handicaps which have turned their works into monumental literary exercises An excellent example of this juggling with words occurs in a novel written by Ernest Vincent Wright an American He decided to write his book without using the letter ' e

To make his task easier, he puts the e on his typewriter out of action so that each time he was about to use it, he was forced to stop and think of alternative words or phrases When you think that nearly every verb written in the past tense requires an ' e you have some idea of the juggling that Wright went through in the course of his writing His novel reads smoothly, even though he denied himself the use of pronouns (he, 'she and "them ') and, most important of all, the definite article, the '

Adventures

The seventeenth century Spanish writer, Lope de Vega, went one better than Wright and wrote five novels each one of which omitted the use of one vowel De Vega, incidentally, was one of the world s most prolific writers even though he is not generally recognised as such He wrote no less than 1 800 plays, which, together with his five novels brought the total of his published writing to some 23 000 000 lines Quite an output when you consider that it all had to be written in longhand !

The Greek writer, Tryphiodorus also went in for literary exercises in a big way He wrote 24 poems telling the story of the adventures of Ulysses and in each poem he omitted one letter of the alphabet. Pindarus who wrote way back in 500 B C. was also fond of juggling with letters He composed a poem of some 46 stanzas in which there was not one letter ' s

Hearing of this particular piece of juggling, an American Baptist preacher James Cargile recently wrote a 13 000 word book in which every single word began with the letter ' s This is not the only case of one literary exercise answered by another There have been quite a few instances.

In reply to the e less novel written by Wright, Lord Holland set himself the task of writing a book in which every word contained the letter "e ' Poets are also fascinated by this kind of jugglery One poem for instance runs to 26 lines each of which is composed in alphabetical succession Thus the poem starts off

An Austrian army awfully arrayed
Boldly by battery besieged Belgrade
Cossack commanders canonading come
Dealing destruction s devastating doom

and so on

This type of poem is quite a marathon piece of composition but prose writers go in for a different type of marathon The prize for marathon sentences surely goes to the French novelist Victor Hugo, who, in his classic book "Les Miserables ' actually managed to construct a sentence which ran to more than two and a half pages of type. In this mammoth sentence were 823 words interspersed with 93 comas, 51 semi colons and four dashes.

Legal phraseology often runs into marathon sentences One such instance, achieved by the city council of Cincinnati in the United States bears commenting on. This epic of verbosity contained a sentence which ran to no less than 20 000 words—about one quarter the length of the average novel ! One wonders whether this particular resolution made much sense

On a slightly different level are Members of Parliament. They can be extraordinarily long winded—no matter what their nationality! One such instance is that of an Australian M P who asked a question about whether a Royal Commission was going to be set up to investigate a particular matter

This man was not mean with words His question ran to 530 words and included no less than 26 sub-sections The reply he got from Mr Menzies the Australian Prime Minister was a model of brevity He merely rose to his feet and answered No !

Marathons

But, getting back to literary marathons, one must mention the colossal work that has only recently been completed by Professor Arnold Toynbee He calls it A Study of History ' and its 3,250 000 words are published in ten volumes Professor Toynbee started writing this work in 1929 which means that it has taken him more than 25 years to complete this particular marathon.

Modern novelists no longer write the marathon length books that were popular a century or so ago Samuel Richardson s novel, "Clarissa Harlowe, runs to well over 1 000 000 words in eight volumes It might have had a certain amount of success when it was first published, but twentieth century authors no longer think in terms of writing such "monster' novels

Yet, two of the world s greatest and most popular novels Tolstoy s War and Peace, and Cervantes "Don Quixote, both run to great lengths 'War and Peace contains about 615 000 words and Don Quixote 461,000 words

Although the modern novel is shorter in length, authors are getting paid at a very much higher rate than they used to be Take the case of Nicholas Monsarrat author of 'The Cruel Sea. He has earned about £200 000 from this one work which means he has been paid at the rate of £1 per word 'Very nice says Monsarrat, "until the tax collector claimed 18 shillings out of every pound !

Refreshment

Nothing is known of what the tax man claimed from Ernest Hemingway when he sold a short story to a Hollywood film company in 1945 This story ran to 3 500 words and Hemingway received no less than £250 000 for it—the highest sum ever paid to an author for so many (or so few !) words.

Arnold Bennett, one of the greatest literary figures of the earlier part of this century, forced himself at one stage of his career to write 1 000 000 words a year Anthony Trollope the novelist used a stop watch to make sure that he kept himself to his target of writing 250 words every 15 minutes

This he usually managed to do before he had his breakfast every morning at the time when he was still a Post Office official In direct contrast to this was the method that Joseph Conrad—one of the greatest English stylists of all time—employed when he wrote He thought he had achieved a lot when he wrote 350 words a day But those 350 words were invariably almost perfect

Robert Louis Stevenson was a writer who went in for speed in a big way He wrote his 64 000 word novel Kidnapped in six days Voltaire the great French satirist completed his classic novel 'Candide in exactly three days

But the prize for speed must surely go to Edgar Wallac who wrote his novel The Devil s Man ' in one sitting With several secretaries working in shifts and a dictaphone, Wallace dictated nonstop for 60 hours, stopping only for refreshment.

Alexandre Dumas, author of the universally loved series of novels The Count of Monte Cristo and the Three Musketeers," is said to have writen more than any other man. There are 12 000 volumes signed by Dumas and although it is not strictly true that he wrote every single line (he was the first man to employ ghost writers ') it is certainly true to say that his was the motivating genius behind this enormous output.

He was often working on four novels at a time which, together with the serials he wrote for the two leading newspapers in Paris brought his personal output up to that of at least ten writers !

Brevity

Quite a few writers believe in brevity A Dutch physician Dr Herman Boerhave, once wrote a book containing 15 words After his death this book hitherto unread fetched, as a rarity the phenomenal price of £3 000 The buyer must have known what he was doing as 99 of the book s 100 pages were blank The work quite simply read 'Keep your head cool, your feet warm and you will make the best doctor poor !

A Frenchman published a book in the first half of this century called 'Should a Woman be Loved ? The entire text of this book ran to five words ' It depends on the woman

---

(Continued from page 42)

can) jihad jirga, ghoul hashish assassin and hamam (Arabic) kimono ju jutsu and bushido (Japanese) tea kotow mahjong and whangee (Chinese) balai laka kulak and artel (Russian)

Words thus borrowed are today part and parcel of the English language which would be very much the poorer if some linguistic fanatic were suddenly to take it into his head to purge such terms out of his dictionary from considerations of philologic l purism.

Fortunately the English people have at no time betrayed any anxiety to rid their tongue of neologisms

Englishmen have never known anything like the French Academy or the Florentine Delia Crusca to arbitrate before the incorporation of a word into their lexicon. Usage is enough English is the world s most hospitable language, and this accounts for its opulence copiousness and vitality ♦♦♦

THE FACTS OF LIFE

By JAMES L HYMES, Jr

To do a good job of teaching you have to know the facts of life Not only the usual facts But the laws if you will—that is a strict firm word—that governs what youngsters must do because they are human, because they are alive, growing These are the facts of life that have the greatest significance for those of us who live with children, parents and teachers

There are many such facts Research uncovers them But they stick out and show in youngsters behaviour teachers and parents uncover them too We become aware of them from listening watching seeing what goes on child after child, year after year The more you read the more you see, the more you come to know This is what they are like this is how they have to behave this is what they can do and this is what they cannot

These are controlling facts No youngster decides I will be this way His bones decide for him His nervous system does His whole human heredity makes the behaviour imperative There are areas of freedom and of free will There are points where will power and determination can make the decision. There are many instances where choice enters in—a youngster simply wants or prefers a certain path of action And instances where education is the answer—a child has been taught to act a certain way

But a whole deep powerful part of life is blocked off from persuasion, fenced off from arguments untouchable by lures even unaffected by punishment. These ways of acting are bred into the person, an unchangeable part of his being These are the facts of life we have to know about, and face and make our peace with

We ignore such facts at our peril Disregarded, our teaching cannot get over our efforts cannot take, we work in vain We ignore such facts at youngsters peril The laws disregarded, the children pay a price which can be painful a price ranging from steady discomfort to a damaging sense of unworthiness

One such fact is that *each child preserves himself* He seeks first and foremost as a matter of survival the nourishment he has to have because he is a human. Food? Yes And sleep and air But humans need other kinds of sustenance as well love respect attention acceptances a sense of growing and achieving the feeling of being needed

Call this their psychological food. It comes in many different packages But you can sum it up like this A child has to feel good about himself He has to have a reason to be glad he is who he is He must feel good and then he can be good

Fortunately most of us get enough of what we need to feed on—physical stuff the more intangible psychological vitamins But this may be unfortunate because it stops us from seeing that humans do not die easily We fight for life when need be Most of us get along sufficiently well so that life is not a battle. But the fact is always there We will preserve ourselves if we have to Good ways or bad, nice ways or not, approved disapproved, we will strive to get what we have to have

This effort always comes first We cannot give ourselves to other jobs at hand until it has first been reasonably well settled This rounded selfpreservation—not food alone not just water and air—is a built in instinctive first "choice

Another key factor is that *each child acts his age* A youngster cannot move far beyond the time he has had in which to mature The human is not unlike our seasons Six months into the year and the days will be warm six months further and the snow falls Temperature and precipitation follow their appointed rounds, not free to change to meet individual desire Just so the human moves and changes, and in all of his capacities Six months into life and certain behaviours have to take place Six years and the old ways are sloughed off New behaviours occur compelled by the fixed orbits of growth and doomed in turn to be replaced

We might well wish for a different child before us just as we often wish for a summer day or for rain gently falling It might be better to have a child less active more self-controlled, better able to remember, more capable of enthusing about symbols and generalities or in a hundred other ways better able to take what we want to teach him. But just as everyone complains about the weather but no one does anything about it so too, no one can change the child's basic underlying physiological structure This is a determinant of how he will think, what he can respond to what will excite him and what will leave him cold

There is one consolation and in it the challenge That every year like every season has its uses Always there are things youngsters *can do* Always even in infancy Never is there a useless period in growing a stage just for marking time Nor is there ever a mortgaged period a time promised for tomorrow no good now except as it gets the child ready for something yet to come

At every moment there are experiences, rich and educationally significant and worth while in themselves which children have grown enough to utilise But we have to be nimble enough to provide them We must do the adjusting—the child cannot. Not because he is lazy Not because he does not try And not because of willfulness and stubborn ness Because he is human and this is a fact of life.

The consolation and companion challenge exist too with the human search for satisfac tions These needed nutrients cannot come to children out of vacuum There is no separate isolated place to which children "go to come back filled There need not be—there cannot be—a wasted waiting time while youngsters off somewhere get what they have to have The food for self preservation—the normal diet and the make up foods—comes to child ren through the daily experiences of living with people working together sharing life.

But again, we must be the nimble ones The living can be good living the kind a school can be proud of But we must shape that living and guide it so there is a steady flow to certain youngsters of the special kinds of vitamins that they need The flow cannot be left to chance A mature adult glad to see youngsters get what they need plans carefully with individuals in mind

This is to say a third fact of life *Each child is an individual* different from all others unique and very special He is an unusual mixture of his heredity of his past and present living Nothing identical has ever exist ed nothing identical ever will He may be almost like many others he will share many things in common. But—this is the wonder and the glory of life—he is himself *different*

The whole setting of the teaching job lures us into seeing people in their commonness We teach children in groups. Our classes are large We are teachers not tutors group workers, not individual counsellors But the whole set of the human insists See *me* in *my*

Fortunately there is an important consola tion here too Youngsters do not ask for perfection from us They would need per fection the finely exact adjustment, were they inanimate But these are facts of life The child is working too to get the satisfaction he needs to act his age to be himself He asks from us, not super human skills but very human effort. With a decent try on our part, he will grow well When we do all that we can he is in there trying too and he will make out

—o—

TRUTH

I am but a seeker after Truth. I claim to be making a ceaseless effort to find it. But I admit that I have not yet found it To find Truth completely is to realize oneself and one's destiny I am painfully conscious of my imperfections and therein lies all the strength I possess because it is a rare thing for a man to know his own limitations

—*Mahatma Gandhi.*

• • •

STRENGTH

Strength is the one thing needful Strength is the medicine for the world's disease. Strength is the medicine which the poor must have when tyrannized over by the rich. Strength is the medicine which the ignorant must have when oppressed by the learned. And it is the medicine that sinners must have when tyrannized over by other sinners —*Vivekananda*

• • •

ATHEISM

The old religions said that he was an atheist who did not believe in God The new religion says that he is the atheist who does not believe in himself —*Vivekananda*

• • •

WAR AND PEACE

The common notion that peace and the virtues of civil life flourished together I found to be wholly untenable Peace and the vices of civil life only flourish together We talk of peace and learning peace and plenty peace and civilization but I found that those were not the words which the Muse of History coupled together on her lips, the words were peace and sensuality peace and selfishness peace and death. I found in brief that all great nations learned their truth of word and strength of thought in war that they were nourished in war and wasted by peace taught by war and deceived by peace trained by war and betrayed by peace—in a word that they were born in war and expired in peace

—*Ruskin*

Intelligence Test

(Below are given twelve questions to test quickness of your mind and intelligence It does not matter that you attempt all the questions What matters is the time taken by you to find the correct onswers The whole paper should not take more than 30 minutes to a fairly intelligent person Try now and find out)

—QUESTIONS—

1. Answer the following questions

(a) My next door neighbour has had three visitors First, a doctor called, then a lawyer and then a clergy man What do you think has been happening there ?

(b) Suppose a man does something that is unkind Why do we forgive him more readily if he was angry than if he was not angry ?

(c) Why should we judge a person by what he does, and not by what he says ?

(d) Suppose you were going to undertake something very important what should you do first of all ?

2 Some of the following statements are silly Pick out the silly statements and give reasons for their being silly

(a) A boy said to me, "I have three brothers—Jack, Tom and myself'

(b) A man once said 'If I should ever grow desperate and kill myself I shall not choose a Friday to do it on for Friday is an unlucky day and brings me bad luck

(c) A man has lived all his life on a crust.

3 Study each row of numbers below and state in each case which two numbers will come next.

(a) 19 16 13
(b) 8 16 24
(c) 4, $\frac{1}{4}$ 7 $\frac{1}{8}$ 10 $\frac{1}{16}$,

4 The following are the names of some of the famous men with letters mixed Write down the correct name in each case.

(a) A I H D N G
(b) E A O R T S S C
(c) S S K H P R E E E A A.

5 Two boys went to a garden. One of them climbed up a tree and plucked some The two boys divided the among themselves half and half But the one who had not climbed the tree gave his friend one mango more, as he had taken extra trouble Now the number of mangoes with one is double of what it is with the other

Tell how many mangoes were plucked and how they were divided

6 Complete the following analogies :—

(a) Pen is to ink as pencil is to
(b) Aeroplane is to fly as ship is to
(c) Bird is to feather as fish is to
(d) Snow is to white as sky is to
(e) Chair is to sit as bed is to

7 Make a new word by taking away only one letter and putting another in its place either in the beginning or at the end

(a) bribe (b) dark (c) know
(d) sow

8 Read this and answer the questions below

A is an odd number between 7 and 11 B is equal to 4 C is 3 smaller than B D is equal to half B E is equal to A B

(a) What is E worth ?
(b) What is $D+E$?
(c) What is $D-C$?
(d) What is $B+C+D+E-A$?
(e) What is D times A ?

9 What would be the most useful thing to do first of all if your baby brother's clothes caught fire while your mother was upstairs and you were close at hand ?

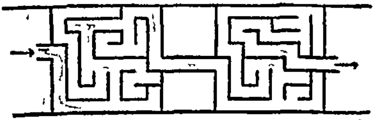
(a) Fetch some water
(b) Wrap him up tightly in a rug
(c) Run upstairs to fetch mother
(d) Telephone for doctor
(e) Open the window to admit air

10 Decide whether in your opinion, the following statements are true, usually true occasionally true or false

(a) The sun rises in the west.
(b) Pork comes from pigs
(c) Yesterday to-day was tomorrow
(d) When it snows it is winter
(e) Sun and moon can be seen at the same time
(f) All pillar boxes are red
(g) Policemen on duty wear uniform
(h) Good Friday falls in the month of April
(i) Churches are struck by lightning
(j) No girls play football

11 What mistakes has the printer made in the sentences below ?

(a) When a man goes to church to get married, his vest man accompanies him



(b) Mans laughter is a very serious offence in this country

(c) Every night as he lay in bed, he wrote in his dairy an account of the day s adventures

(d) When the girl wished to marry her step-mother Mrs Jones strongly objected

(e) The kitten dolled herself up into a ball

12 How should an officer get through the following military formation ? Trace the route

—ANSWERS—

1 (a) Some one was dying
(b) Because he didn t know what he was doing
(c) Because actions speak louder than words
(d) Think it over

2 (a) He had only two brothers
(b) If he killed himself the day would not matter
(c) Not silly, because he has lived on the crust of the earth.

3 (a) 10 7 (b) 32 40 (c) 13, 1I

4 (a) Gandhi. (b) Socrates
(c) Shakespeare.

5 Six mangoes were plucked One had four and the other two

6 (a) lead (b) sail (c) fin
(d) blue (e) lie

7 (a) tribe (b) lark (c) knot
(d) son

8 (a) 5 (b) 7 (c) 1 (d) 3 (e) 11

9 Wrap him up tightly in a rug

10 (a) false (b) true. (c) true.
(d) usually true (e) occassionally
(f) usually true (g) usually true
(h) usually true. (i) occassionally true
(j) false.

11 (a) Vest should be best.
(b) Mans laughter should be manslaughter
(c) Dairy should be diary
(d) Commas after marry and Mrs Jones should be inserted
(e) Dolled should be rolled.

12. Start in the direction of the arrow on the left, going down the first street then horizontally half way Go up, turn left into the third street from the left, go up again, turn right into the second street from top go up and along the corridor connecting the two squares Coming to the middle of the second square go up, turn left go down along the line common to the first and the second street from the bottom turn left, then straight up and along the first street at the top Turn into the second street, from the right, turn left into the third street from the top and along the inner line and there is the way out.

UNDIGNIFIED FLIGHT

'I have been told that bees always crawl upwards so if one alights on your arm raise it and the bee will go up it into the air But I always had the secret dread that one day some would land on my ankle, and—not thinking to discuss this dreaded happening with the kind, calm beekeepers—I had horrific mental pictures of my beating a most undignified retreat on my hands, feet waving madly in the air and veil trailing in the dust!'

—Hazel Matthews

GENERAL KNOWLEDGE TEST

Test your knowledge. Solve the following questions without any extraneous help When finished, look up for the answers and compare Try and see.

QUESTIONS

1 Give the names of the reorganized States of India and of the Head of each State and mention the centrally administered territories.

2 Give the names of the following —

(a) The poet who wrote the song, which has been made the National Anthem of India
(b) The first Governor General of India after Independence
(c) The first Indian Governor General of India.
(d) The first Indian Commander-in-Chief of the Indian Army
(e) *The first Indian Lady to be appointed Governor of a Province*
(f) The first Indian lady to become Minister in a Province
(g) The first woman President of the United Nations Organization
(h) The Secretary General of the United Nations Organization
(i) The Commander of the U N International Police Force in Egypt
(j) The Prime Minister of Hungary during the recent troubles in the country who was reported to have been abducted
(k) The place where the Sixteenth World s Olympic Sports Festival was held
(l) The country which scored the highest number of points in these sports.
(m) The country which scored the next highest number of points
(n) The Captain of India s Olympic Hockey team
(o) The country by defeating which India won the Olympic Hockey Title for the sixth time

3 Enumerate in not more than five lines each of the following —

(a) The five principles of international relationship known as the Panch Shila
(b) The five World Organisations connected with the United Nations Organization
(c) The five demands made by Pakistan in connection with its dispute with India over the State of Jammu and Kashmir, when the question was discussed in January 1957 in the Security Council of the U N O

4 Name the Indian town in which each of the following is located

(a) National Defence Academy
(b) *The Headquarters of the Western Command*
(c) The Camel Corps of the Indian Army
(d) Air Force Academy
(e) Defence Services Staff College
(f) The biggest Fertilizer Factory
(g) Hindustan Aircraft Factory
(h) Locomotive Works
(i) Railway Coach Factory
(j) Penicillin Factory
(k) Hindustan Shipyard
(l) Tata Iron and Steel Work
(m) The National Stadium
(n) Forest Research Institute
(o) Indian School of Mines

5 What do the following abbreviations stand for?

(a)	O C.	(b)	Lt Col
(c)	N C O	(d)	N C C.,
(e)	I A F	(f)	P T
(g)	A I R.	(h)	B.B C
(i)	G M T	(j)	I.S T
(k)	I A.S	(l)	I P S
(m)	P T I	(n)	l b w
(o)	M C.C.		

6 Name the following places, persons or books —

(a) The birthplace of Gautam Buddha
(b) The founder of Jainism

(c) The oldest collection of Vedic hymns

(d) Shri Krishna s discourse to Arjun.

(e) The ancient city in West Punjab first entered by Alexander

(f) The father of King Asoka

(g) The bloody war which made King Asoka renounce war

(h) The Chinese traveller who visited India during the reign of King Harsha

(i) The author of Ramcharitmanas

(j) The ancient Buddhist University near Pataliputra

(k) The king who completed the building of the Qutab Minar

(l) The popular religious reformer of the fifteenth century, who was a weaver by profession

(m) The king who made the first Grand Trunk Road from Bengal to Peshawar

(n) The pioneer of religious and social reform in modern India

(o) The British Viceroy who set up a Government Department for the preservation of ancient monuments

7 What important event in Indian or World History took place on each of the following dates ?—

(a) 623 B C (b) 544 B C.
(c) 327 B C. (d) 55 B C.
(e) 1066 A D (f) 1215 A.D
(g) 1498 A D (h) 1600 A D ,
(i) 4th July, 1776 A D
(j) 1789 A.D (k) 1858 A D
(l) 1885 A D
(m) 28th July 1914 A.D
(n) 1st September 1939 A.D
(o) 26th November 1949 A.D

8 With what important battle or war do you principally associate each of the following names ?

(a) Helen of Troy (b) Porus
(c) Leonidas (d) Joan of Arc;
(e) Prithviraj (f) Ibrahim Lodi.
(g) Maharana Pratap
(h) Chand Bibi (i) Lord Clive
(j) Washington (k) Lord Nelson
(l) Duke of Wellington
(m) Florence Nightingale
(n) Rani Lakshmi Bai
(o) Eisenhower

ANSWERS

1.

FRUIT PRESERVATION

Jam Making

India is rich in fruits and vegetables and a fairly prosperous trade can be set up in preserving them. A very common method of preservation is making them into jams

Principles of Jam Making

A really good jam must keep well and should be clear and bright in colour, well set but not too stiff, and should have a distinct fruity flavour

Choice of Fruit

The first consideration in jam making is the fruit, which should be as fresh as possible and if anything, very slightly under ripe In practice a mixture of ripe and unripe fruit is often used and is quite satisfactory Over-ripe fruit, however never makes satisfactory jam since it will not set properly

Extraction of Pectin

The reason why fruit is capable of forming a gel or jelly when boiled with sugar is because it contains in its cell walls a natural gum like substance called "pectin When making jam the first object is to extract the pectin from the fruit, and it has been found as a result of many tests that this can be done most easily when the fruit is slightly under ripe The presence of acid is also of importance, as not only does it help in the extraction of pectin but it is essential to a good set brightens the colour of the jam may improve the flavour and helps to prevent crystallization of the sugar

Addition of Sugar

Another ingredient which is essential in jam making is sugar This plays an important part in the set of the jam and its concentration in the finished jam must be such that neither fermentation nor crystallization will occur easily also, the sweetness has to be taken into consideration The limits between which a jam is likely to ferment because it contains too little sugar and is liable to crystallize because it has too much sugar are quite small Therefore it is important to add the right amount of sugar and to boil until the correct-concentration is obtained Even when the jam has been boiled to the right degree care must be taken in covering and storing otherwise it will go mouldy during storage.

Jam Pans

Brass or copper preserving pans were considered to be the best for jam making but recent knowledge has shown that jam made in those pans contain less ascorbic acid (vitamin C) than those made in enamelled aluminium, or stainless steel pans The only advantage seems to be the green colour given by traces of copper to certain jams.

Although short boiling of fruit in aluminium pans is not harmful fruit should not be left in metal pans longer than necessary Enamelled pans should be unchipped otherwise the jam is liable to be burned and the iron may spoil the colour New enamel pans will last longer if before use they are filled with cold water and brought slowly to the boil.

Galvanized iron or untinned iron pans should not be used, as fruit acid attacks the metal

It is a mistake to try to make too much jam at once. To allow room for the jam to boil vigorously the pan should only be about half full when the sugar has been added. A small piece of butter margarine or a little glycerine rubbed over the bottom of the pan helps to avoid scum and prevents the pulp from sticking

Preparing the Fruit

The fruit or vegetable is prepared as for other culinary purposes stems leaves or diseased portions are removed and the fruit rinsed in cold water Stone fruit may be left whole or stoned If the flavour of the kernal is liked in apricot or plum jam, the stones may be cracked and the white kernels cooked with the fruit

(1) Softening the Fruits

The fruit should generally be cooked gently for some time before the sugar is added - The object of such cooking is to soften the skins and to break down the cell walls of the fruit and so extract the pectin Sufficient water should be added to prevent the fruit from burning but the amount needed will depend very much on the juiciness of the fruit the amount of fruit in the pan and the source of heat. A shallow pan which allows quick evaporation needs more water than a deep one. When increasing the quantities in a recipe, less water is required in proportion, also the riper the fruits the less water is usually required for softening and cooking The fruit should be brought to the boil and then allowed to simmer gently until it is reduced to a pulp. All fruit which require

added water should be boiled down by about one third before the sugar is added

(2) Addition of Acid

If the fruit being used is one to which the addition of a little acid is necessary, this should be added before the fruit is cooked as it helps to extract the pectin. The addition of acid is essential when making vegetable jams

The following substances may be used to provide additional acid and the quantities suggested are suitable for adding to 4lb fruit

Lemon juice 2 tablespoonsfuls of juice (approximately 1 average sized lemon) Citric or tartaric acid ½ level teaspoonful of either

Vegetables contain practically no acid and will require more than these amounts

Testing the Setting Point

The Setting point of jam occurs most readily when the sugar concentration is about 65 per cent, of which about 5 per cent will be obtained from the fruit, and 60 per cent from the added sugar The following are the methods of testing concentration

(1) *Weight Test* This is a very satisfactory method if suitable scales are available and small quantities of jam are being made It is not suitable for jams made from very sweet fruits such as cherries

The weight of the empty pan and spoon should be noted The setting point should be reached when the jam weighs 10lb for every 6lb of sugar used To determine the final weight, the quantity of sugar used should be multiplied by 10 and divided by 6 e g, if a recipe gives 3lb sugar and 3lb fruit the jam should be reduced till it weighs 3×10÷6=5lb It must be remembered that the weight registered on the scales includes the weight of the pan and the spoon.

(2) *Volume Test* In this method the volume of the jam is tested No additional equipment is required but this method is not as accurate as the weight test when using shallow pans.

The yield of jam expected is calculated in lb s as in method (i) and this number is measured in 1 lb jam jars full of water and poured into the pan so that the water should take up the same volume as the required amount of jam A clean stick with a flat end (e g the handle of a wooden spoon) is held upright in the centre of the pan and the level of the water marked on it Care must be taken to see that the pan is on a horizontal surface and the stick held vertically while testing The water in the pan is then thrown away When the jam is to be tested draw the pan away from the heat, let the bubbles subside and then test with the stick When the jam has been reduced to the marked level, the right yield of jam should be obtained

(3) *Temperature Test* A theremometer marked in degrees up to at least 220°F is required for this method It should be put in hot water immediately before and after testing the temperature of the jam If the jam is boiled to 220°F, the sugar percentage will usually be right and if the fruit contains plenty of pectin and acid the jam will set. The jam should be stirred thoroughly before the temperature is taken Occasionally temperatures of 221°F, or even 222°F, will be found to give better results

(4) *Flake Test* A wooden spoon is dipped in to the jam, removed and turned horizontally in the hand until the adhering jam is slightly cooled The jam is then allowed to drop from the edge and if it has been sufficiently boiled so that the jam has partly set on the spoon the drops will run together forming flakes which break off in a clean, sharp manner

(5) *Cold Plate Test* If a little of the jam is cooled on a plate the surface should set and crinkle when pushed with the finger The jam should not be allowed to boil rapidly whilst this test is being made otherwise the setting point may be missed

Jam Covers and storage

The correct proportion of sugar has much to do with the keeping quality of the jam but even when the percentage of sugar is high, the jam may go mouldy if kept in a damp store The type of cover used is also of great importance A waxed disc, pressed evenly over the surface of the jam while it is still hot, certainly prevents mould growth to a large extent and if any mould should grow it seldom penetrates through the paper on the jam

It has been found that jams covered with parchment or transparent cellulose paper keep better than those covered with metal covers lined with cardboard The waxed cardboard discs often put on under the parchment also tend to increase the likelihood of mould growth Home made covers (such as grease proof paper dipped in egg white or tissue paper dipped in milk) if used are better put on at once while the jam is very hot

Jam should be stored in a dark, airy cupboard at ordinary room temperature Excessive heat or damp encourages mould growth

In these columns we answer the queries from our readers It may not be possible to answer each and every question but a considered reply shall be given to selected questions Letters from our readers are welcome These should be addressed to the **Editor, Question Box.**

UNSTABLE GOVERNMENT

Q Why does the French Government changes so quickly ?

—Roop Narain Singh
7, Holland Hall

Ans. To be stable, certain conditions are necessary for a democratic government to fulfil The most important of them is the confidence in it of the people as a whole. This confidence can be gained by a government if it has an acceptable ideology and then puts it into practice. Governments in France have failed to fulfil these conditions Moreover since the ending of Second World War no party had ever an absolute majority in the Legislature to form a stable government.

SPORTSMAN

Q Who may be called a sportsman in the real sense ?

—Krishan Gopal, Dehra Dun

Ans A real sportsman takes his victory and defeat alike and bears no ill will to his opponents

26th JANUARY

Q What significance is attached to the date of 26th January apart from the fact that on this day our constitution came into force ?

—Balbir Singh Chandigarh.

Ans At the Lahore Session of the Indian National Congress (1929) a resolution was accepted declaring that the goal of India was complete Independence and that 26th January should be observed every year as Independence Day

TECHNICAL EDUCATION

Q Kindly advise me about the names of colleges in India where education to enable the candidate to qualify himself for the post of a Labour Officer and Personnel Officer can be had

—G.L. Kapur, Balmara Assam.

Ans 1 Tata Institute of Social Sciences Bombay—8

2. Institute of Social Sciences, Kashi Vidyapith Banaras.

3 Calcutta University, Calcutta

4 School of Training of Labour Welfare Workers, Gymnasium Building, Worli Bombay

5 Y.W.C.A. School of Social Work Delhi

EXAMINATION

Q I am intending to appear for the examination conducted by Chartered Insurance Institute. I shall feel obliged if you very kindly let me know wherefrom I can get the particulars

—Anand Kumar Jain Meerut.

Ans Examinations in Insurance are conducted by—

1 Indian Life Assurance Offices Association Churchgate, Bombay

2. Indian Merchants Chamber Fort, Bombay

3 Chartered Insurance Institute, 20 Aldermanbury, London, E.C. 2.

NUCLEAR PHYSICS

Q Please name the Institutions in India where post graduate courses in Nuclear Physics are taught

—Laxman Pd Singh, Bhagalpur

Ans 1 The Tata Institute of Fundamental Research Bombay

2. Institute of Nuclear Physics, Calcutta.

THE STATUS OF JAMMU & KASHMIR

Q When Jammu and Kashmir is an integral part of India why then Bakshi Ghulam Mohammad is called Prime Minister, instead of Chief Minister ?

—Hari Mohan Sinha, Shillong.

Ans According to the terms of accession the State of Jammu & Kashmir was given a special status That is why the head of the cabinet is called Prime Minister Relations of this state with the centre are defined in article 370 of the Constitution.

ONE-UNIT SCHEME IN PAKISTAN

Q What is one-Unit Scheme regarding Pakistan ?

—Kanwar Rajendra Singh, Jullundur

Ans After the Partition West Pakistan comprised West Punjab Sindh, N W F P and Baluchistan All these regions were combined into one unit called West Pakistan, having one legislature Dr Khan Sahib was the first Chief Minister of West Pakistan There is now a move to break this unit.

WOMEN CANDIDATES

Q Please let me know the conditions regarding marriage of women candidates for the IAS competitive examinations

—Rani, Trivandrum

Ans The conditions are stated thus

(a) It will be open to the Government of India not to appoint to the Indian Administrative Service and Indian Police Service a woman candidate who is married or to reqire such a candidate who is not married to resign from the service in the event of her marrying subsequently if the maintenance of the efficiency of the Service so requires

(b) For the Indian Foreign Service a woman candidate is eligible only if she is unmarried or a widow without encumbrances If such a candidate is selected, she will be appointed on the express condition that she might be called upon to resign from the service on marriage or re-marriage

VETO

Q. What is VETO ?

—Kamal Kumar Shillong

Ans Veto is a power to annul the decision of a committee or a council The term is current these days with reference to the U N Security Council where the U.S.S R. has used this power very often.

CONCENTRATION OF MIND

Q How is concentration of mind attained ?

—R.R Misra, Patiala

Ans. Concentration of mind presupposes a healthy mind in a healthy body One must develop a balanced mind and cultivate those virtues which may free it from jealousy and greed. Singleness of purpose is also necessary Mind is very fugitive but once it is controlled it puts man in possession of a very great power

LEGISLATURES IN ENGLAND & U.S A

Q Compare the organisation and functions of the House of Commons of England and the House of Representatives of the U.S A

—N R Gupta Chhattarpur

Ans The supreme legislative power in Great Britain indeed in the British Empire is vested in the King in Parliament that is the King, House of Lords, and House of Commons

By the Parliament Act of 1911 the House of Commons is practically supreme in all legislation According to the Act, public bills other than money bills or a bill extending the maximum duration of Parliament if passed by the House of Commons in three successive sessions whether of the same Parliament or not, and rejected by the House of Lords may with the royal assent become laws without the concurrence of the Lords provided that two years have elapsed between the second reading in the first session in the House of Commons, and the third reading in the third session

The legislative power of the United States is vested by the constitution in a Congress which consists of two houses a Senate and a House of Representatives The Senate or Upper House represents the States the House of Representatives the people The Senate represents the federal principle of government the House of Representatives the nation

The course through which a bill goes to become an act in U S.A is similar to the English practice A bill may originate in either house but it must pass through both houses and receive the signature of the President. If one house passes a bill and the other house amends it, the amended bill must be adopted by the house which first passes it before it proceeds to the President for signature. Bills for raising revenue must originate in the House of Representatives, but the Senate may propose amendments to them

INTELLIGENCE TEST

Q Would you kindly be good enough to explain the question No 5 of Intelligence Test on page 931 of your Careers & Courses" of November 1957.

—Rattan Lal Rustogi Simla-4

Ans The question was meant to test

comprehension The only point to be caught was that the clock struck an odd hour between one and five and this was obviously three The first gun was fired ten minutes before this

SOCIALISM AND COMMUNISM

Q What is the difference between socialism and Communism ?

—*S.M Asghar, Calcutta*

Ans The term socialism has often been used interchangeably with anarchism and communism The reason for this is that socialism covers many degrees of the same class of thought The essential idea in all types of socialistic thought is the social ownership of the instruments of production and exchange and of land Collectivism or, as indicated above, 'Socialisation more adequately connotes what socialism proposes to achieve. But socialism may be moderate or extreme. Moderate socialists believe in the gradual and peaceful evolution of a socialist society They are sometimes called evolutionary socialists. Extreme socialists believe in bringing about a social revolution by a class war, and in replacing democratic government by the dictatorship of the proletariat They are sometimes called revolutionary socialists Revolutionary socialism is the same as Russian communism which is to be distinguished from pure communism or simply com munism

Communism is one of the earliest and the most universal of social doctrines for it is a relic of the golden age and the state of nature which have received homage from writers of all kinds in all countries and in all ages—poets philosophers theologians mystics novelists and revolutionaries In its simplest form it is a dream of utopias as pleasant as it is false but when it passed from the realm of fancy to that of the practical world it became one of the fiercest and most aggressive social programmes that the world has ever known.

INDIAN F.R.S

Q Please write the functions of the Royal Society and the names of India s F.R.S

—*Ram Bhawan Sinha, Rapaspur*

Ans. Founded in 1645 Royal Society was organised for the study and promotion of natural sciences So far the following have been India s F.R.S

A Carsetji — S Ramanujam
J C. Bose — Megnad Saha
C.V Raman — Birbal Sahani.
K.S Krishnan — S.S Bhatnagar
H J Bhabha. — S Chandrasekha.
P C. Mahalanobis

FALSEHOOD

When Aristotle was asked what a man could gain by telling a falsehood he replied, 'Never to be credited when he speaks the truth

(Readers' views on various problems— Economic, Social, Cultural, Educational, Political, etc —are published in these columns Letters should be cogent and concise They may be written under a pseudonym, but must be accompanied by the writer's name and address)

THE CULTURAL FUTURE OF INDIA

Dear Sir,

The cultural future of India will be the outcome of the economic development of India and the economic relations among Indians as well as between India and the outside world, the education of India's entire population in the arts and the sciences the assimilation by ever increasing numbers of Indians of the best modern thought and technique—in short on the moral and material prosperity of Indians No period of past Indian History can be made to return to India howsoever desperate the effort made by enthusiasts of revivalism The India of the future cannot conceivably be Vedic India or the India of the Ramayana and the Mahabharta of Asoka and Chandragupta, of Akbar or Tulsidas

The making of modern India has been an extremely painful process It began with the British conquest of India British rule is over But the forces set in motion in Indian life by British Rule have come to stay and to continue

When we think of the cultural future of India we should make ourselves keenly aware of the fact that the cultural future even of such countries as France and England Germany and America in fact of the whole world is passing through an unprecendented crisis The two most significant events of the twentieth century have been the last two world wars and the two big revolutions, the Russian Revolution and the Chinese Revolution These two Revolutions are not isolated limited events In India as elsewhere it is impossible to conceive of the making of history which will not be powerfully influenced by these two revolutions These revolutions are world forces The capitalistic countries with all their material might are no more world forces They represent not tomorrows but yesterdays not the future but the past.

In this dramatic context we have to think of the cultural future of India as of the rest of the world The groundwork and the rich context of the future culture will be emphatically socialistic. Thus we shall have in future India architecture and the building arts all the decorative arts and crafts music and dance and painting the theatre and the cinema many games and sports and festivals which will be distinctly Indian. But they will also have a world context or a universality which will draw its inspiration from science and socialism

The past belongs to us but we don t belong to the past Our past will live in the new culture of India but not as it lived in the past ages of India just as the childhood and youth of an individual live in that individual s prime of life but that individual s prime of life does not live in his childhood and youth

INDIA WITHOUT NEHRU

Sir

While I have every respect for you and your journal Careers and Courses and am a regular and fond reader of it, I strongly object to a sentence in your editorial of the November 1957 issue of your paper The sentence is Without him (Nehru) India would stagger and perhaps collapse (Page 889 Column 2 lines 21 and 22)

There can be no two opinion that Mr Nehru is a dynamic personality in the world today and that he commands a great respect from the people at home and abroad Neither can it be denied that under his worthy guidance India is making a fast and steady progress and will become one of the greater nations of the world if he is spared to us for many

many years more You I should also say, have dealt with his life and reputation in the editorial in quite a learned manner and deserving to that great personality I myself have a great regard for this national hero of our great country

But my opinion is that no nation is or should be fully dependent for its existence on one single personality or a few men Abraham Lincoln was not only the President of the U S A one time but something more He was the beloved of the Americans. Queen Victoria besides being the ruler of England was the soul of every Englishman In our own country Akbar the great Mughal was widely respected and his courtiers were often anxious as to who would govern the kingdom after him, as Prince Salim was of an easy going and rebellious nature But did the death of these persons lead the nations they governed to collapse? No Instead we may say that the national progress continued and with greater speed

So while we should have every regard for our Prime Minister and should pray to God to spare him amongst us for hundreds of years more we should not belittle our great nation by thinking it to be fully dependent on him or any other man or group

Jahangirabad   Yours etc

DISCIPLINARY EDUCATION

Sir,

It is highly regrettable that since the dawn of independence although India has adopted democratic form of government yet the true spirit of democracy is lagging behind The real malady which is hampering its success is that the pre requisite of democracy, *viz* disciplinary education has not been imparted to the people sufficiently By disciplinary education we mean the education according to rules or to say more bluntly the subordination of one s personal likes and dislikes to the common good No doubt much accent has been given on this exigency in the first and second five year plans still this speed will take another fifty years to bring cent percent literacy

It is no exaggeration to say that in the people s government, the general masses should be conversant about their problems They should be competent enough to understand the real problems of their own country The present eighty percent problems like deficit finance language issue, casteism provincialism etc. are still existing because of lack of proper education

Had the people been educated in the proper manner most of the financial deficit for the implementation of the plan would have been supplemented by our own resources Moreover the education which is given to us is not congenial to the present needs It does not teach us the lesson of humanity The golden maxim of the education that one must be free to do as he likes with regard to his own affairs but where the interest of the society is concerned he should *subordinate his interest to the interest of society* has been relegated to the background If the citizens of this country were to follow this golden rule this land would become a heaven on earth

Pathankot,   Yours etc.

THE ADMINISTRATIVE STAFF COLLEGE

Sir

In the November issue of your journal 'Careers & Courses' you have published information about the Administrative Staff College of India on pages 944 and 945 The *following inaccuracies are noticed therein*

(i) On Pagé 944 under the heading ADMINISTRATIVE STAFF COLLEGE it is stated in the first para that the Administrative Staff College began work in Hyderabad from 6th September 1957, with the first batch of candidates The College is actually going to start its first session only on 6th December, 1957 with its first batch of students Presumably this mistake is due to adopting the information published by certain newspapers which wrongly put the date of commencement of the course as 6th September instead of 6th December 1957

(ii) In the last para it is stated that the Visiting Instructors are Mr J W L Adams Mr K.T Chandy and Mr Vazifdar They are the Director of Studies Director of Research, and Special Adviser to the Principal respectively

As your journal happens to be a source of information for a good number of candidates appearing for the various competitive examinations we would be glad if you can publish the necessary corrections in the next issue of your journal and thereby prevent the

candidates getting wrong information

The Administrative Staff College of India Hyderabad

INTERNATIONAL DATE LINE

Sir,

In your monthly magazine 'Careers and Courses of September 1957 under GENERAL KNOWLEDGE TEST the answer of Question No 5 (a)—What is the International Date Line? is wrong and it should be as below —

It is an imaginary line separating the lands of the Pacific where American date is kept from those where Asiatic date is kept It passes, generally along with the 180° longitude with an exceptional deviation at three places so as not to complicate the time of the peninsulas and islands situated in the vicinity of 180° longitude

A traveller bound for westward journey if crosses this line on Monday he drops a day of his calender and Wednesday follows the Monday for him and a traveller bound for eastward journey repeats the date of crossing the International Date Line

PEN FRIENDS CLUB

Sir

I had an opportunity to go through your issue for the month of November, 1957, and noted the letter under the caption 'The Pen Friends Club written by B R Pathak In reality it is a good suggestion made by Mr Pathak By just starting this Pen Friends Club through your magazine many of us can come closer and can exchange our views about different problems of life and suggest some remedy for the difficulties we are to face in our daily life. We can widen the circle of our knowledge. In the end I will request you to start this pen friend's club as suggested by Mr Pathak with Rs 2/ as the membership fee.

Hissar
14-11 1957

Yours etc
M. P Nanda

• • •

PEN FRIENDS CLUB

Sir

I fully endorse the idea of Mr B R. Pathak's letter published in your Magazine on the above subject It is a very good idea Most of the youngs suffer due to the lack of such clubs One is not in a position to exchange ideas on various topics

I approach you to kindly consider the proposal put forward It will prove to be useful for all

Patiala

DO YOU KNOW ?

Progress of Family Planning

During 1956-57 and up to the end of August 1957 the opening of 186 rural clinics and 112 urban clinics was approved by the Family Planning Board

Of these States Governments are to open 160 rural and 43 urban clinics local bodies are to open 20 urban clinics while 26 rural and 49 urban clinics are to be started by voluntary organisations

During 1957 58, up to the end of August 1957 grants amounting to Rs 9 17 lakhs have been sanctioned Of these grants for rural clinics amount to Rs 83 230 and for urban clinics Rs 3 66,877

The first regular training course for personnel to be in charge of family planning clinics of four weeks duration started at Ramanagram on August 12 1957, and the training course in Bombay started on September 2 57

For organising a touring training team a grant of Rs 18 000 has been sanctioned to the Family Planning Association of India

Two demographic centres have been sanctioned For the centre at the Delhi School of Economics most of the staff has been recruited and has started work Proposals for starting a centre at the Indian Statistical Institute are still awaited

A field study on foam tablets has been started at Ramanagram A foam tablet has been developed at the Contraceptive Testing Centre Bombay and a small quantity of these tablets produced by the Medical Store Depot Madras are also being tested at the centre

It is proposed to publish a popular journal to educate the public on family planning and a grant of Rs 30 000 has been sanctioned during 1957 58 for this

STUDENTS' EMPORIUM

STUDENT HOMES AND DAY SCHOLARS CLUBS

Establishment of Student Homes Day Scholars Clubs and Health Centres in larger University towns institution of 100 post graduate scholarships of Rs 200/ p m. 70 post doctoral fellowships of Rs. 300/ p m and 40 Senior U G C. Fellowships of Rs 50/ p.m establishment of Poor Students Aid Fund in Universities and arrangement of publication of scientific literature by university teachers are some of the important decisions taken by the University Grants Commission at their meeting held in New Delhi recently

The Commission has made a suggestion for setting up Student Homes and Day Scholars Clubs in certain university centres As a first step the Commission has sanctioned the establishment of 2 Student Homes in Calcutta 2 Student Clubs in the Punjab and a Club each at Aligarh Banaras Patna and Osmania (Hyderabad) Universities

A student home will enable a student to spend his entire days in this home and will have facilities for study, food recreation washing and possibly tutorials These homes are proposed to be administered by bodies to be set up by the University on which service organisations like the Ramakrishna Mission Y M.C A etc may be represented It is hoped that this will at least partially compensate students for the extremely unsatisfactory conditions in which many of them live at present.

The Student Clubs have the similar purpose except that they will be on a somewhat smaller scale These clubs will be located in localities in large cities where students live in crowded conditions in their own home It is proposed to provide adequate club facilities in these institutions so that students can spend their leisure time in a pleasant and profitable manner Each of these clubs will register 1 000 students

The Commission also plans to assist universities to set up health centres in large university towns The intention is that there should be a centre where a check up on students health can be made and a dispensary provided and arrangements for taking care of students in a preliminary way before they are hospitalised can be made.

In order to encourage research work and specialised studies, the Commission has decided to institute as a first step, 100 post graduate scholarships of Rs 200/ p m. 70 post doctoral fellowships of Rs 300/ p m and 40 Senior U G C Fellowships of Rs 500-600 p m It is proposed as an experiment to set apart 12 of the post graduate scholarships to enable students who have taken a Master s Degree in the fundamental sciences to do a course in Engineering This is intended to meet the need for engineers with knowledge of fundamental sciences

These scholarships and fellowships will be in the field of sciences and are supplementary to 80 post graduate scholarships and 50 research scholarships already provided under the Humanities which would be awarded in the near future Applications for these scholarships will be invited through the universities.

To help poor but brilliant students to pursue higher studies the Commission has approved a proposal for the establishment of Poor Students Aid Fund in Universities The Commission will give financial assistance towards this scheme on the following basis:—

(a) Each University may have a Poor Students Aid Fund constituted under the aegis of the University (b) The object of this Fund will be to render financial assistance to poor students to meet their tuition or examination fees or to purchase books or similar other expenses No scholarship will be given from this Fund (c) The constitution functions and administration of the Fund shall be framed by the University and financial assistance given to poor students in *accordance with the Rules framed under* the Constitution of the Fund (d) Every student of the University will contribute (at least Re 1/) per annum to the Fund (e) The University Grants Commission will contribute each year a sum equivalent to the total amount contributed by the students subject to a maximum of Rs 10 000/ per annum (f) The Fund will be administered by the University concerned Students will be associated in a suitable manner with the Body appointed to administer the Fund and (g) A copy of

the Constitution and Rules framed thereunder shall be sent to the University Grants Commission A copy of the Report of the administration of the Fund shall also be sent to the University Grants Commission every year

The Commission has decided to provide a sum of Rs. 1 lakh during the next financial year for the publication of scientific literature by university teachers This is supplementary to a provision made earlier for the publication of learned works in the field of Humanities and Social Sciences by teachers in the Universities This will include publication of scientific journals, learned lectures by Indian and Visiting Professors proceedings and papers read at Seminars and learned conferences and also monograms, pamphlets or books by specialists

The Commission has also set apart a sum of Rs 1 lakh to enable teachers of science in the Universities to spend brief periods at other centres of research and to make educational visits within the country

* * *

DON T SAY ' DON T WORRY"

Worry is the curse of the age Doctors tell us that over 50 per cent of all illnesses are due to emotional stress Nearly all gastric ulcers are caused by worry It is now demonstrated that many cases of asthma and rheumatoid arthritis are the result of emotional upsets

People say Don t worry ' This is exasperating and psychologically wrong They might just as well say "Don t be depressed and then you ll automatically become cheerful If you sit on a pin you react instinctively The pain is nature s way of informing you that something is wrong So it s silly to say Don t take any notice !

You worry because something is pricking you mentally If your business is on the rocks you have every reason to worry A bottle of medicine won t put things right. A sleeping tablet won t check the downward trend on your sales chart. You ve got to find what is wrong and put that right This of course is easier said than done Hence worry insomnia and the gastric ulcer You take this to the doctor But the busy physician only treats the physical symptoms not the cause underlying the physical breakdown

Why does worry cause so many illnesses ? We now know that emotions act on the glands and internal secretions from the glands reinforce the activities of our bodily organs It acts like this You step off the kerb to cross the road Suddenly you see a car bearing down on you You stop hastily run back, and your heart is "all of flutter Apprehensiveness acts on the endocrine gland sending a swift flow of adreanalin into the blood stream Surplus energy is at once supplied to the heart the muscles and so on and this energy makes you run from danger Thus does Nature protect us

If this emergency energy is not discharged but continues hard at it like this, without relief it causes all sorts of bodily trouble If you have a toothache, a couple of aspirins will relieve the pain But you know you've got to go to the dentist In the same way, when worry stops you sleeping you take a couple of tablets—as thousands of people do in order to get some rest But you have only dealt with the symptoms not the cause The modern psychologists insist that, with emotionally induced illnesses you must get to the cause of the trouble and put that right.

Are you afraid of losing your job ? Well it should act as a spur Most of us need prodding Anyhow face up to things Years ago a big firm as an economy stunt, dismissed six of their top men and promoted understudies Every one of the dismissed men found another job—some at higher salaries. Many men have had setbacks of one sort or another But I ve never known a good man go under—except through worry (By *Marshall Lawrie*)

KEATS S CONCEPTION OF BEAUTY

Prof V De Sola Pinto told the English Literature Seminar at Delhi University on December 7, 1957, that Keats s profound observation What the imagination seizes as beauty must be truth whether it existed before or not —not only describes his own poetry but much of the art of this century Like Blake who worked in obscurity and like Byron who astonished all Europe with a blaze of notorious publicity, Keats was a heroic figure

The poet nursed a consumptive brother a love for Fanny Brawne which could never be consummated and a conscientious muse which exacted from him constant revision intellectual honesty and imaginative growth. And in all this Keats never expressed regret or self pity His attitude to life and to literary criticism was robust He subjected himself to penerating self criticism and he did not hesitate on one occasion to engage a bully with his bare fists

Keats s aesthetic problem was this how was the love of the Beautiful to be reconciled with the spectacle of universal suffering ? From the beginning of his poetic career the problem obsessed him and he sought to resolve this in a series of short and long narrative poems The beautiful poem *The Eve of St Agnes* was a piece of radiant mediaeval art The *Ode to Autumn* was the most objective and perfect record of the sensuous enjoyment of nature

Endymion stands for the poet s spiritual experience and his search for the truth Keats s aesthetic of negative capability the ability to pass into other beings and live other lives produced some delightful poems in which the poet sought to identify the sensuous and the philosophical

The young Keats found that ancient Greek religion exalted the delight in the senses Wordsworth s remark on Keats s *Hymn to Pan* "A pretty piece of paganism Mr Keats — illustrates well Keats s early bent and the older poet s conservatism

Influenced by Spenser Wordsworth Milton and Shakespeare in turn by the time of the writing of *The Fall of Hyperion* Keats had been able to incorporate the autobiographical element organically into an allegorical structure partly intensely lyrical, and partly epic. In this poem Keats worked on the idea of a great poet who had taken upon himself the sufferings of humanity

GUIDE TO CAREERS THE GRAM SEVIKA

A Gram Sevika works with village women. She teaches them better methods of house keeping facts about nutrition and balanced diet the art of cooking the way to preserve food and fruit the use of labour saving devices in the home and at the farm home decoration and advises them about maternity problems, child care, etc

She tries to create in the village women a desire to improve their living conditions and shows them, by practical demonstration how to make better homes. She prepares them in every way to take their legitimate place along with their men folk in the management of their village homes and farms

The *gram sevika* is employed under the Community and the National Extension Service Projects Under these projects the villagers are shown cooperative methods of reconstructing the village economy and bettering their living and working conditions

A *Gram sevika s* job involves regular visits to village homes and living and working with village women She is a friend, companion and guide to the villagers Rural work of this sort is most interesting to persons who are fond of working in the quiet and peaceful surroundings of the Indian village It can be very pleasing too, as the fruits of one s labour can be seen everyday in the improvements taking place all round.

The way to qualify Extension Training Centres and 'Vidyalayas run by the Kasturba Memorial Trust, spread over the different linguistic regions of the country give one year s training to women selected for village level work as *gram sevikas* Candidates for the training should have studied up to the matriculation standard They should ordinarily belong to the countryside There is no restriction as to the age of the candidates for admission but women between 18 and 35 are preferred

Women selected for training receive a stipend of Rs 50/ per month, from which their food and other expenses have to be met. Living quarters are provided free of rent. The trainees manage a cooperative mess and share jointly the duties of hostel and camp maintenance After completing the training they are required to serve the State for at least three years, in return for the free training and stipend they receive

The training given to a *gram sevika* prepares her for efficient service in three major fields of rural reconstruction (a) rural health, hygiene and sanitation rural cooperatives; home conomics which in ludes family budgeting civics and adult literacy, recreation (b) cottage-crafts and farm industries like spinning bee keeping and (c) improved farm practices and animal husbandry She is taught how to extend to the village home, the farm and to the rural community practical knowledge and information in the above fields

The way to enter the service Young women desirous of becoming *gram sevikas* should apply to the Development Commissioner of the State in which they live The selection is made by the State Social Welfare Board in consultation with a Kasturba Trust representative The selected candidates after successful completion of training are appointed as *gram sevikas*

Personal qualities necessary for a successful *gram sevika* are sympathy tact, and continued interest in the village people, an

earnest desire to know them intimately understand their customs and rituals family and farm ties, and problems of the village community She should be large hearted friendly and frank in dealing with them Being simple in habits persuasive and direct in conversation and a good mixer will help win the confidence of the village women

Capacity to show how to apply new knowledge about home and farm practices is an important asset in the *gram sevika*

Good health and love of open air life are essential requirements The selected candidates have to pass a medical test

Openings for *gram sevikas* are readily available under the Community and National Extension Service Projects One *gram sevika* is assigned to a block of five villages She forms a vital link between the Government and the rural people in the national programme of rural development.

The salary of a *gram sevika* varies from State to State After training a *gram sevika* is generally employed on a p y of Rs 100/ per month

Prospects for advancem nt are g od under the Community Projects Administration as Instructors in the training centres In the wider field of social welfare also under the local authorities and in industry experience of all round betterment work in the rural areas is a valuable qualification for better positions and well paid jobs

For further information about selection training and appointments you may contact

1 The Development Commissioner of your State
2 The Central Social Welfare Board New Delhi
3 The Social Welfare Board of your State
4 The Kasturba Gandhi National Memorial Trust P O Kasturbagram District Indore (M B)
5 The Employment Exchange nearest your home

Employment Outlook

By 1961 every one of our villages is expected to be served by *gram sevikas* Each Block of 100 villages will have two *gram sevikas* On this basis employment opportunities will be available for 8 000 women social workers Provision is also to be made for a reserve of additional 1 000 workers Training for *gram sevikas* is now offered at 25 centres

Gram Sevika Service gives you a unique opportunity as well as a satisfying work experience in the building of a new rural society and in actively h lping the village people to grow in happiness and p osp rity

(Courtesy M nistry of Labour, Government of India)

FORTHCOMING EXAMINATION

Air Force Flying College Examination

The Union Public Service Commission will hold an examination at Allahabad Bombay Calcutta Delhi Hyderabad Ludhiana Madras Nagpur Patna Shillong and Srinagar sometime in May 1958, for entry into the Air Force Flying College Age Limits —Candidates must have been born not earlier than 4th January 1938 and not later than 3rd July 1941 THESE AGE LIMITS CAN IN NO CASE BE RELAXED Qualifications— Matriculation *or equivalent* Applications from candidates who have appeared or intend *to appear at* Matriculation or equivalent examination acceptable provisionally Application forms and full particulars obtainable from Secretary, Union Public Service Commission Dholpur House New Delhi by remitting Rs 1/ by Money Order or on cash payment at the counter Candidates must clearly state on Money Order Coupons AIR FORCE FLYING COLLEGE EXAMINATION MAY, 1958 and also give their name and full postal address in block letters Postal Order or Cheques or Currency notes will not be accepted in lieu of money orders

Application forms and connected papers are also obtainable free from the nearest Air Force Recruiting office UNMARRIED MALE CANDIDATES CAN APPLY FOR ADMISSION TO THIS EXAMINATION Completed applications must reach Union Public Service Commission by 8th February 1958 (22nd February 1958 for candidates abroad)

HOW BHOODAN MISSION WAS BORN

By SUDHIR CHANDRA LAHA

[Bhoomikranti (Land revolution) Week (13th 18th April) as an expression of people's support to the cause of Sarvodaya is observed from 18th to 18th April every year The occasion reminds us of the first act of Bhoodan

It took place six years ago on 18th April 1951 The scene was in Pochanpalli a Harijan village in Telangana then in Hyderabad State an area at that time infested by violence and arson where people were being harassed and crushed between terrorists demands and police counter repression The tense situation overshadowed the deliberations of the 3rd Sarvodaya Sammelan which had just then concluded its session under the guidance of Vinoba Workers keenly felt that their efforts and endeavours in the constructive field were inadequate to face the challenge of the reigning violence in the contiguous area and unless some method could be evolved to face it our claim that non violence had the potentiality of offering moral solutions to all situations involving conflicts would suffer by default

It was thus that the leader of the Conference went to the area of unrest declining offers of help and police protection and humbly walking on foot and trusting himself to God Destiny was not long in responding and in a way nobody could dream of

Listening to villagers and speaking to them at prayer meetings Vinoba reached Pochanpalli on *18th April 1951* Seated amongst the assembled villagers he invited them to speak out An aged Harijan stood up and expressed their tale of sorrow He told how they had been deprived of their hereditary occupation and were thrown back on the land as labourers working on others fields with little recompense and having no land of their own Could they be given some land? In that case they could eke out a living by their own labour *Having no land* of their own was at the root of their misery which knew no bounds Asked how much land would they need the old man answered after consultation that 80 acres would do for the 40 landless families in the village

Vinoba said this would mean contacting the authorities and seeking redress from them with uncertain response Then he turned to the assembly and enquired whether having listened to the prayer of the landless Harijans, the villagers could offer any answer to the prayer

Ramachandra Reddy a sturdy village elder stood up and trembling in emotion announced that he wanted to give Vinoba 100 acres of his family land for distribution at Vinoba s discretion

The assembled people, including Vinoba were stunned Could they believe their ears Had they heard right? Vinoba asked Reddy to repeat Reddy repeated his words and offered to put them in black and white then and there

Lo and behold a miracle had happened before their eyes Land held so dear was being given away for mere asking A new star had arisen on the horizon and a new light had descended from heaven People felt as if they were in the divine presence The whole assembly was electrified and their eyes shone with inspiration

The basic problem of the village life was spotlighted and the solution indicated as if by the light of a divine spark and the Bhoodan *Mission was born*

That night Vinoba could not sleep The magnitude of the problem and his own frailty seemed to overwhelm him But the inner voice urged him to go forward without fear that the mission was the work of God and that he was but an instrument of the Divine will

And so from next morning Vinoba became Bhoomi baba The news of his land gifts mission went ahead of him The son of God was coming and men women and children flocked from far and near to have his darshan and listen to his words Once a ninety year old aboriginal bent down to touch his feet Vinoba enquired if he wanted to live longer The old man replied now that he had seen the Lord's face he could die in peace

So the indomitable will inspired by God has moved Vinoba on to his mission. For more than six years now he has surprised himself his friends and his doctors by his sustained energy After a particularly trying day in which he had conversed with nearly 2000 villagers his companions were worried he was overtaxing himself Vinoba settled their doubts Today I have been visited 2000 times by God

With his frail body, racked by an ...

TECHNICAL AND ENGINEERING EDUCATION

A scheme for rationalising and upgrading salary scales of teachers of technical institutions on all India basis so as to attract well qualified and experienced personnel to the teaching profession was approved by the Co-ordinating Committee of the All India Council for Technical Education at a meeting held on December 3, 1957 in New Delhi Prof M.S Thacker, Secretary Department of Scientific Research and Technical Education presided

The Committee recommended that the Central Government should bear the major responsibility for the additional expenditure involved in improving the staff position in technical institutions

The establishment of an engineering college in Bombay under the auspices of Bharatiya Vidya Bhavan and another in R i pur near Bhilai Steel Plant by the State Government was also approved

The committee expressed that shortage of teachers for engineering colleges and polytechnics would make difficult all plans of development of technical education in the country and standards of training of technical personnel will deteriorate Qualified technical personnel preferred to join various establishments and organisations other than technical institutions In several institutions the shortage of staff was more than fifty percent and it was not possible to maintain proper standards of instruction

The All India Council for Technical Education had set up some time back an Expert Committee under the chairmanship of Dr J C. Ghosh Member Planning Commission to prepare a detailed scheme for rationalising and improving the staff and salary structure far technical institutions

The scheme prepared by the Expert Committee in consultation with State Governments and University Grants Commission classified technical institutions into three categories viz:

(a) Institutions functioning at post-graduate level

(b) Institutions functioning at the first degree level and

(c) Institutions offering diploma courses

For these three categories of institutions the Co ordinating Committee approved a scheme for model structure and salary scales

The Co ordinating Committee accepted the recommendation of its Western Regional Committee for the establishment of an engineering college in Bombay by the Bharatiya Vidya Bhavan for conducting degree courses in Civil Mechanical and Electrical Engineering The college which is estimated to cost about Rs 38 lakhs (for buildings and equipment) will have an intake of 120 students per year

The Committee also approved the establishment of polytechnics in the following places

West Bengal —In Jhargram and in Behrampore by the State Government

Assam In Nowg ng by the State Government

Bombay In Aurangabad and Amraoti by the State Government

Kerala In Trivandrum by the State Government and at Alleppy by private body

Madras at Salem at Tanjore at Virudhnagar and at Sankarnagar by private bodies

Rajasthan at Udaipur by the State Government

Uttar Pradesh at Bareilly and at Jhansi by the State Government

The Committee further approved the scheme of establishment of an engineering college in Raipur near the Bhilai Steel Plant a ea by the State Government of Madhya Pradesh under the Second Five Year Plan The college will offer degree courses in Civil Mechanical and Electrical Engineering Metallurgy and Mining Engineering

The Committee approved the institution of a post graduate course in photogrammetry at Roorkee University in collaboration with the Survey of India and post-graduate in Food Technology at

Calcutta and Department of Chemical Technology, Bombay University

• • •

FAILURES IN EXAMINATIONS

There is a direct proportion between the number of private candidates and the number of failures and the largest number of failures is found in English and Mathematics This is the conclusion reached as a result of a survey made by the All India Council for Secondary Education

According to the survey the preliminary examination of the data received from 18 Boards and 9 Universities showed

(i) On the average the percentage of failures at the school final examination is about 50%

(ii) In Universities like Jamia Vishva bharati and S N D T where the number of students is small the percentage of failures is low

(iii) There is a direct proportion between the number of private candidates and the number of failures

(iv) The difference in the percentage of failures between students who appear after regular schooling and those who appear as private is not very large.

(v) The largest number of failures is to be found in English and Mathematics The failures in Indian History and Civics come next

• •

ADMISSION TO DELHI COLLEGES

Dr K L Shrimali made the following statement in Lok Sabha

The University of Delhi has permitted Pannalal Girdharilal D A V College to open the Preparatory and Ist Year B A Pass Classes from the current academic year The College started functioning from August 17, 1957

As regards girl students, the University has also submitted a proposal that pending the institution of a new Women s College the University may be permitted to open a non Collegiate Women Students Delegacy which with enrol Women students for the qualifying class and for the 1st year of the B A (Arts) degree course

Besides, the University of Delhi propose to open four evening colleges some of which also function as day colleges from the academic year.

These measures may not provide accommodation for all students seeking admission. Since in the matter of admission to colleges, the emphasis must be on selection rather than on indiscriminate expansion the resources available for University education are being utilized mostly for consolidation and improvement of quality

• • •

COURSES IN JOURNALISM

Dr K L Shrimali told in the Lok Sabha that the following Universities have introduced Courses in Journalism —

Names of Universities	*Position regarding Courses in Journalism*
Madras	The University conducts a diploma course in Journalism in the University itself. The Course is a full time one extending over a period of one year from January to December
Nagpur	The University has introduced courses for both Diploma and Certificate Examinations in Journalism These are taught at the Hislop College Nagpur which is affiliated to the Nagpur University The duration of the Course for each of the examinations is of one academic year
Calcutta	The course of study in the subject of Journalism is in operation at the University
Punjab	There is a University Journalism Department and classes are held in the Camp College New Delhi.
Gujarat	The University has introduced the courses of study in Journalism since long but no College or Institution has still come forth for conducting the said courses
Mysore	Journalism has been introduced as a course of study in the University It is included as one of the optional subjects for the B A Degree and is taught in the Maharaja s College, Mysore
Osmania	There are two courses for Journalism namely Diploma in Journalism and Certificate of Proficiency in Journalism open to graduates and High School Certificate examinations passed candidates respectively Both courses are of one year s duration

No grant has been given so far by the

University Grants Commission for financing any schemes of Journalism at any University in 1957-58

* * *

ENGINEERING COLLEGES UNDER SECOND FIVE YEAR PLAN

The Union Minister of Education and Scientific Research stated in the Rajya Sabha that 8 Engineering Colleges 29 Polytechnics and 61 Junior Technical Schools were being established in various States during the Second Five Year Plan The Engineering Colleges would be established one each in Andhra Kerala Bombay Madhya Pradesh, Punjab Orissa and two in Assam

Of the 29 Polytechnics 6 were being established in Mysore 3 in Andhra, 1 in Kerala 1 in Pondicherry 5 in Bombay, 3 in Madhya Pradesh, 1 in Punjab 2 in Rajasthan 2 in Uttar Pradesh, 1 in Jammu and Kashmir 3 in West Bengal 1 in Tripura and 1 in Assam

Out of the 61 Junior Technical Schools 18 would be established in Kerala 2 in Bombay, 5 in Madhya Pradesh 6 in Punjab 4 in Rajasthan 4 in Jammu & Kashmir 7 in West Bengal 10 in Bihar, 2 in Orissa and 1 each in Tripura Assam and Himachal Pradesh

In addition, 3 Engineering Colleges and 9 Polytechnics sponsored by private agencies had also been approved so far by the Government during the current Plan period Out of the Engineering Colleges, 2 would be established in Madras and 1 in Punjab and out of the 9 Polytechnics 3 would be established in Madras 4 in Kerala 1 in Andhra and 1 in Madhya Pradesh

* * *

NATIONAL DISCIPLINE SCHEME

The genesis of the National Discipline Scheme can be traced to the well recognised need to find a solution to the malady of growing indiscipline specially among students It was felt that a feasible method of inculcating discipline in the younger generation was to introduce a scheme which would inculcate disciplined behaviour, physical fitness and a proper appreciation of the moral and spiritual values in the students at an early stage of their lives to make them conscious of the traditions and heritage of the country and to make them fit for future duties as worthy citizens of India The scheme was conceived and given a start by the Ministry of Rehabilitation in July 1954

The two broad aspects of the Scheme are (a) physical training in the field on semi-military lines designed to diciplne the body of the child and (b) mental training through lectures in class rooms on India s cultural heritage traditions acts of heroism leadership and patriotism with a view to discipline the mind

No funds have yet been placed at the disposal of the Ministry of Education and Scientific R search by the Ministry of Rehabilitation for this scheme

The Scheme was already in force in schools for displaced children in Punjab Bombay, West Bengal Uttar Pradesh Delhi Madhya Pradesh and Jammu & Kashmir

* * *

BOOKS FOR NEO LITERATES

The Union Ministry of Education and Scientific Research invites books and manuscripts for the fifth prize competition for the best books for neo literate adults

The books and manuscripts may be in any of the Indian languages and may deal with any subject provided it is useful to neo literate adults in their economic, social and cultural life They should not be more than 48 pages in length in demi octavo size and should be written in a simple and attractive style and adequately illustrated

Closing date for the receipt of books and manuscripts is April 30 1958

Details regarding number of copies to be submitted, amount of entry fee etc may be had from the Special Officer (Literature) Ministry of Eduction and Scientific Research New Delhi

* * *

U S S R GOVERNMENT SCHOLARSHIPS

The Government of the U S S R. have offered 11 scholarships to Indian nationals for post gradute study or research during 1958-59 in any one of the following subjects —

(a) *Basic Sciences*—Astronomy Botany Chemistry Geology (including prospecting) Mathematics Physics Statistics and Zoology

(b) *Technology*—Heat Power Engineering Machine Design and Construction Workshop Technology Met llurgy Mining with special reference to Coal and Mechanical Methods Petroleum and Gas Engineering Mineral Technology Chemical Engineering E'ectrical Engineering (traction, illumination and ques) Architecture struction and A[illegible]

(c) Agriculture and
(d) Medicine

The value of each scholarship which is tenable upto a period of three years is Roubles 680 (Rs 809 52) p m with exemption from tuition fees free hostel accommodation, free medical aid, book allowance clothing allowowance and cost of tourist/second class sea passage both ways

Candidates should possess at least a second class Master's degree in Science or Agriculture or at least a second class Bachelor's degree or equivalent qualifications in Engineering Technology or Medicine and at least two years' teaching practical or research experience and should not be more than 35 years of age

They should either be employed as teachers in universities, colleges or comparable institutions of higher education or employed and engaged in research work in recognised research institutions and should be sponsored by their employers.

Prescribed application forms and other information can be had from the Ministry of Education & Scientific Research Scholarships Division (Section S 18) New Delhi

The last date for receipt of applications in the Ministry through the sponsoring authority is January 15 1958

• • •

EXTENSION LECTURES BY DELHI UNIVERSITY

With a view to establishing close contacts with the citizens of Delhi the University of Delhi had introduced a scheme of *Extension* lectures comprising two series, viz. (a) General Education— Introducing India' Series and (b) Specialised lectures on different topics said Dr K.L Shrimali in the Lok Sabha on December 12.

The General Education course which covers cultural, historical economic and social aspects of Indian life, was inaugurated on November 11, 1957, and would conclude in March 1958

The course is open to citizens who enrol themselves on a payment of a nominal fee of Re. 1/ On the termination of the course it is proposed to issue certificates to those who have attended the full course

The course of Specialised lectures is expected to commence on January 13, 1958

—o—

(*Continued from Pag 64*)

and taking nourishment equal to less than half of physiological requirements, he has marched on his mission across the country thousands of miles while the Bhoodan *Ganga* in its course has collected many devotees The Bhoodan *Yagna* has thrown out branches of *Sampattidan* (Gift of income) *Sramdan* (Gift of labour) and other gifts Bhoodan has grown into Gramdan i e all lands in a village should be held in trust by the entire village community The revolution thus seeks to rebuild our social life on a higher plane of human relationship based on compassion where private ownership of land or wealth disappears into a common pool cared for by the village panchayet as trustees for the whole people and servants of God May we heed the message of the revolution and welcome it for the need is urgent and the pressure and tension of contracts in wealth and possessions are on the point of bursting into violence with unpredictable results for all Let us all do our bit to bring into being the advent of Sarbodaya.

INTELLECTUAL BELIEF

We may try to talk learnedly and of books but when it comes to brass tacks—when we are face to face with a calamity—we behave like children and begin to cry and pray and our intellectual belief gives no satisfaction

—*Mahatma Gandhi*

• • •

CONSISTENCY

I have never made a fetish of consistency. I an a votary of Truth and I must say that I feel and think at a given moment on the question without regard to what I may have said before on it.—*Mahatma Gandhi*

• • •

SWARAJ

Real Swaraj will come not by the acquisition of authority by a few but by acquisition of the capacity by all to resist authority when it is abused In other words Swaraj is to be attained by educating the masses to a sense of their capacity to regulate and control authority

—*Mahatma Gandhi*

SCIENCE & INVENTION

THE ROBOTS ARE COMING

The robots will be with us soon not the huge machines that calculate but robots more or less, in human form

M Albert Ducroeq famous French maker of robots attending the second international Cybernetic congress at Namur Belgium, showed his latest creation an electronic articulated doll The doll responds to all sorts of external influences sensitive to light and sound Already Albert Ducroeq had presented in France his wonderful 'fox' that could move about and avoid obstacles

The robot is now approaching the stage where it will be seen in commerce performing simple operation with life like accuracy

Already at the Foire de Paris a robot was shown that moved from place to place before a line of goods and answered any question regarding them

From there to taking the packages from the shelves and handing them to the customer along with the bill will be a mere step Of course the robot at the Foire de Paris could not speak but was connected with a hidden observer who answered the questions through a loudspeaker within the very cleverly constructed shop attendant.'

• • •

SCIENTISTS USE THE MOON AS RADIO RELAY STATION

Scientists of the United Naval Research Laboratory have successfully used the moon as a relay station, it was reported recently They told fellow scientists that they have transmitted both voice messages and radar signals to the moon and that these were echoed back

High frequency radar signals transmittad the messages at 3 000 megacycles at the rate of 300 times a second They returned from the moon as a weak but detectable echo about 2½ seconds after the time of transmission having completed a round trip of nearly 500 000 miles (more than 800 000 kilometers)

• • •

PORTABLE BRAIN

International Business Machines Corporation of New York has perfected a portable electronic brain that can perform many of the jobs previously accomplished by massive electronic data processing systems that fill entire rooms

Known as the IBM 610 Auto-Point Computer, the machine is about the size of a spinet piano It is mounted on wheels and can be rolled about The company says a high school student can learn to operate it in an hour

At a press preview the machine tackled computations involved in the trial design of a power transformer that had kept an engineer using a desk calculator busy for six hours. The 610 came up with the answer in 20 minutes

IBM officials say the machine can solve problems involving bridge and highway design jet aircraft construction, heat transfer calculations for the petro chemical industry actuarial studies for insurance companies and pension plans reduction of test data for guided missile performance studies and forecasts of retail sales.

The computer is capable of 214 additions or subtractions and 52 divisions or multiplications a minute. It can be rented for 1 150 dollars a month or purchased for 55 000 dollars

• • •

LUMINESCENT TELEVISION PANEL

In the home of tomorrow each room may have a luminescent television panel hung on the wall like a picture on which programmes are projected by a central TV receiver

The new image producing panels named Sylvatron are a recent development in the United States The manufacturer Sylvania Electric Products Inc. says home use of Sylvatron is likely in about five years First uses of the panels now undergoing tests, will be for the improvement of radar air traffic control computing devices and allied instruments.

Sylvatron panels are complex devices that combine the sciences of lighting and electronics Through the use of phosphors, which are made to glow by means of electric current, and substances that carry an electric current only when light shines on them different types of images are produced for use in various ways.

One type of panel electrically manipulates the position of a mobile dot of light on a panel. Another reproduces the track of a mobile spot of light and if desired 'stores' the image indefinitely on a panel. A third type utilizes electroluminescence to place a motion picture or television image on a panel.

Sylvatron panels are being tested for use in radar "mapping" ships and planes in scanning aircraft instruments and in 'storing' information in computing devices.

• • •

NEW LIGHT ON MILKY WAY

The Milky Way Galaxy, a gigantic "pinwheel" of stars in which the sun and earth are located is half again as big as astronomers have thought. Its size has not actually changed, but the stellar beacons (stars) astronomers use to gauge distances are found to be farther away than was recently believed. According to the report submitted to the American Astronomical Society by three University of Wisconsin astronomers the expansion of the Milky Way brings our galaxy's dimensions back close to the size proposed about 30 years ago by Dr. Harlow Shapley, retired director of Harvard College Observatory. Since then, it had shrunk but now it is bigger again. The increase in the Milky Way's size follows by a few years the doubling of the distance scale to other galaxies, of which the universe has unnumbered billions. Because of this doubling of extragalactic distances the measurements within the Milky Way were re-examined.

• • •

TOBACCO CHEWING CAUSES CANCER

The data collected by the Indian Cancer Research Centre is suggestive of the greater pre-disposition to cancer of those who chew tobacco. There is no evidence to suggest that the chewing of betel leaf and betel nuts causes cancer. Persons smoking cigarettes and *bidis* are liable to be victims of lung cancer.

This information was given by Shri D. P. Karmarkar, Minister for Health in answer to a question by Shri Bibhuti Mishra in the Lok Sabha.

• • •

BABY'S CRYING MAKES CRIB ROCK

An ingenious father in Texas in the south-western United States has invented and placed on the market a crib that starts to rock when the baby in the crib begins to cry.

The secret of the crib, which may be of inestimable value to many parents of small children is an electronic control device. The noise made by the baby's crying actuates this and the control then starts an electric motor. The motor, in turn operates a device that rocks the crib.

The unique feature of the device is a two-tube electronic unit that filters out all other noises except the high pitched cry of a baby. The device is made by Ducky Bed In., Lubbock, Texas.

• • •

DETECTING CANCER

Ultrasonic sound waves can be beamed into the human body like radar to detect early cancer, a group of United States medical researchers reported recently in the *Journal of the Acoustical Society of America*. Ultrasonic sound waves vibrate at higher frequencies than those that can be heard by the human ear.

The researchers reported that different types of tissues in the body give different echoes when struck by the ultrasonic waves. These echoes can be recorded on an electronic instrument. The strength of the echo indicates the diseased condition of the tissue. One examination provides medical information that is not obtainable by any other means, not even by X-ray pictures—the researchers said.

• • •

ENZYME DISSOLEVES BLOOD CLOTS

Dangerous blood clots may soon be dissolved by an enzyme injected into the blood stream as a result of research conducted by scientists at Yale University in the United States.

The scientists report that 'significant progress' has been made in purifying the enzyme, which is known as plasmin. A purification process was needed to make the enzyme suitable for use and such a process has probably been successfully developed.

Numerous experiments conducted with animals have shown that a blood clot should dissolve and the blood return to normal a few hours after the injection of purified plasmin. Preliminary tests on human patients are now being made. Existing drugs help to prevent the formation of blood clots, but up to now doctors have had no satisfactory method of dissolving a clot.

• • •

AUTOMATIC PLANE NAVIGATOR

An electronic navigator, which can plot the course of a plane and guide it unassisted to within six miles of its destination, has been perfected in the United States. The automatic device beams radar signals to the ground. These are bounced back to the plane where a receiving instrument records the

elapsed time and other information and calculates the plane s speed and drift The system was developed by U S Air Research and Development Command

STUDY OF BLOOD CIRCULATION

Dr Rex L Huff of the University of Seattle in the United States has developed a new method of studying blood circulation in patients with heart ailments which is simpler than previous methods and causes less discomfort to the patient He uses radioactive iodine which is a peaceful product of atomic energy

Dr Huff injects a small dose of human blood serum albumin a common blood protein, into the patient s arm vein To the albumin he adds a small amount of radioactive iodine This gives off radiations that can be recorded by radiation detection instruments The iodine thus acts as ' tracer , which reveals the progress of the blood through the patient s heart

Currently blood circulation studies are often made by inserting tubes into the blood vessels and other methods that may cause the patient inconvenience and discomfort

NEW CAMERA TAKES PICTURES WITHOUT LIGHT

An American engineering firm has demonstrated a refined 'heat picture camera that uses heat waves emitted by an object instead of light waves to take photographs The maker of the device Barnes Engineering Company says it is possible now to tell the temperature of an object from the photographs The temperature difference between blood vessels and surrounding skin can be picked up by the device, the company says The camera is made possible by the fact that all objects above absolute zero temperature give off heat waves called infra red radiations

INDIGENOUS DRUGS FOR CURING DIABETES

The Central Drug Research Institute Lucknow has carried out a number of experiments which have revealed that the dried alcoholic extracts of *Jaman* seeds administered orally to diabetic patients reduced blood sugar and glycosuria Mineral preparations containing calcined tin, zinc iron and ashes of mica with traces of copper and cobalts were found useful in curing clinical diabetes

Extract of the Bija (*Pterocarpus marsupium*) given orally is effective in lowering blood sugars in rabbits as well as diabetic patients

A number of herbal remedies and mineral combinations have been tried in India for curing diabetes since long Oral administration of extracts of onion has been found to be effective in lowering blood sugar in experimental rabbits and dogs Extract of the bulb when injected subcutaneously into rabbits showed action similar to that of insulin.

Pills prepared from watery extract of Rattanjot (*Eochnera rosea*) give remarkable improvement in all the secondary symptoms associated with diabetes without significant reduction in the urine glucose.

A comprehensive review of the subject has been published in the October, 1957 issue of the *Journal of Scientific and Industrial Research*.

RADIOACTIVE TRANQUILISING DRUG

Radioactive carbon dioxide a peaceful product of atomic energy, is being used by United States scientists to produce radioactive reserpine the tranquilising drug obtained from the Indian rauwolfia plant. Reserpine is used for the treatment of some mental disorders and for the reduction of high blood pressure

The radioactive drug is produced by growing the plant in an atmosphere containing radioactive carbon dioxide in a special plant hot house at the Argonne National Laboratory of the U S Atomic Energy Commission.

By filling or tagging the reserpine molecules with radioactive carbon it is possible to trace their pathways throughout the body with great precision. Their location at any given moment can be detected by using radiation detection instruments It is expected that studies now being made with the radioactive drug will contribute important medical information on the beneficial uses of reserpine

SATURN S RINGS ARE OF SNOW

Dr Gerard P Kuiper an astronomer of the University of Chicago in the United States has determined that the rings around the planet Saturn are composed of small snow crystals He used an infrared spectrometer in making the studies that determined this fact

Infrared light rays pierce through the haze in the earths atmosphere When used in making photographs on special films they make water appear black and vegetation white Dr Kuiper said that very little infrared light is reflected from Saturn s rings and that they appear very dark on the spectrometer He added that two of the moons of Saturn appear to be partly covered with snow

One type of panel electrically manipulates the position of a mobile dot of light on a panel Another reproduces the track of a mobile spot of light and if desired stores the image indefinitely on a panel A third type utilizes electroluminescence to place a motion picture or television image on a panel

Sylvatron panels are being tested for use in radar "mapping ships and planes in scanning aircraft instruments and in ' storing information in computing devices

NEW LIGHT ON MILKY WAY

The Milky Way Galaxy, a gigantic "pinwheel of stars in which the sun and earth are located is half again as big as astronomers have thought Its size has not actually changed but the stellar beacons (stars) astronomers use to gauge distances are found to be farther away than was recently believed According to the report submitted to the American Astronomical Society by three University of Wisconsin astronomers the expansion of the *Milky Way brings our galaxy's dimensions* back close to the size proposed about 30 years ago by Dr Harlow Shapley retired director of Harvard College Observatory Since then it had shrunk but now it is bigger again The increase in the Milky Way's size follows by a few years the doubling of the distance scale to other galaxies, of which the universe has unnumbered billions Because of this doubling of extragalactic distances the measurements within the Milky Way were re examined

TOBACCO CHEWING CAUSES CANCER

The data collected by the Indian Cancer Research Centre is suggestive of the greater pre disposition to cancer of those who chew tobacco There is no evidence to suggest that the chewing of betel leaf and betel nuts causes cancer Persons smoking cigarettes and *bidis* are liable to be victims of lung cancer

This information was given by Shri D P Karmarkar, Minister for Health in answer to a question by Shri Bibhuti Mishra in the Lok Sabha.

BABY'S CRYING MAKES CRIB ROCK

An ingenious father in Texas in the south western United States has invented and placed on the market a crib that starts to rock when the baby in the crib begins to cry

The secret of the crib which may be of inestimable value to many parents of small children is an electronic control device The noise made by the baby's crying actuates this and the control then starts an electric motor The motor in turn operates a device that rocks the crib

The unique feature of the device is a two-tube electronic unit that filters out all other noises except the high pitched cry of a baby. The device is made by Ducky Bed, Inc., Lubbock Texas

DETECTING CANCER

Ultrasonic sound waves can be beamed into the human body like radar to detect early cancer a group of United States medical researchers reported recently in the *Journal of the Acoustical Society of America* Ultrasonic sound waves vibrate at higher frequencies than those that can be heard by the human ear

The researchers reported that different types of tissues in the body give different echoes when struck by the ultrasonic waves. These echoes can be recorded on an electronic instrument The strength of the echo indicates the diseased condition of the tissue. One examination provides medical information that is not obtainable by any other means, not even by X ray pictures—the researchers *said*

ENZYME DISSOLEVES BLOOD CLOTS

Dangerous blood clots may soon be dissolved by an enzyme injected into the blood stream as a result of research conducted by scientists at Yale University in the United States

The scientists report that significant progress has been made in purifying the enzyme, which is known as plasmin A purification process was needed to make the enzyme suitable for use and such a process has probably been successfully developed

Numerous experiments conducted with animals have shown that a blood clot should dissolve and the blood return to normal a few hours after the injection of purified plasmin Preliminary tests on human patients are now being made. Existing drugs help to prevent the formation of blood clots but up to now doctors have had no satisfactory method of dissolving a clot.

AUTOMATIC PLANE NAVIGATOR

An electronic navigator ' which can plot the course of a plane and guide it unassisted to within six miles of its destination has been perfected in the United States The automatic device beams radar signals to the ground These are bounced back to the plane where a receiving instrument records the

elapsed time and other information and calculates the plane's speed and drift. The system was developed by U S Air Research and Development Command

STUDY OF BLOOD CIRCULATION

Dr Rex L. Huff of the University of Seattle in the United States has developed a new method of studying blood circulation in patients with heart ailments which is simpler than previous methods and causes less discomfort to the patient. He uses radioactive iodine which is a peaceful product of atomic energy

Dr Huff injects a small dose of human blood serum albumin, a common blood protein, into the patient's arm vein. To the albumin he adds a small amount of radioactive iodine. This gives off radiations that can be recorded by radiation detection instruments. The iodine thus acts as 'tracer', which reveals the progress of the blood through the patient's heart.

Currently blood circulation studies are often made by inserting tubes into the blood vessels and other methods that may cause the patient inconvenience and discomfort

PEOPLE IN THE NEWS

Shri Tensing Narkay

Shri Tensing Norkay the first Indian to reach the Everest top recently paid his second visit to England as a guest at the Alpine Club's centenary dinner During his 10 day stay the persons who climbed with him on Everest acted as his hosts.

According to the Tibetan calendar Tensing was born in the Year of the Hare the 11th of 13 children at Tsa Chu a day's march from Chomolungma (Everest) or as the Sherpa mothers used to tell their children 'The Mountain So High No Bird Can Fly Over It'

Many people think that the title Sherpa means a porter or guide. This is not so The word means man from the east for the Sherpas are a tribe of Mongolian stock whose ancestors migrated from Tibet bringing their way of life with them

He grew up in the village of Thami at a height of 12 000 feet learning to grow potatoes and barley and how to tend sheep and yaks He was sent to a monastery but lost his chance of learning to read and write Tibetan when he ran home after a Lama had beaten him

The Sherpas returning from the 1921 1922 and 1924 Everest expeditions gave him other ideas They brought back strange boots and clothing and spun yarns about climbing almost to the sky At 13 he played truant and trekked the 200 miles to Kathmandu After six weeks he returned to be hugged, and soundly spanked

Five years later again without telling his parents he left for Darjeeling with twelve others, hoping to be taken on as a porter for the 1933 Everest expedition But he had no certificate for previous experience and even though he cut off his pigtail they said No, you are too young He was bitterly disappointed Instead he sold milk and found work as a labourer and lived in Toong Soong Busti the Sherpa shanty town

At last in 1935 Eric Shipton gave him his chance on the Everest reconnaissance He was chosen last of all and carried a load to the North Col at 22,000 ft. which was as far as the expedition went. He had a chance to see the real techniques of mountaineering and now other expeditions followed again to Everest in 1936 and then twice to Garhwal In 1938 on the last Everest expedition before the war he carried a load to Camp VI at 27 200 ft and won his Tiger Medal—the Himalayan Club award to the highest climbing Sherpas but fourteen years were to pass

EVEREST FRIENDS MEET IN LONDON
During his recent visit to Britain Shri Tensing Norkay who in 19 3 reached the summit of Mount Everest with Sir Edmund Hillary is seen here with Sir John Hunt leader of the expedition, on his arrival at London Airport Tensing who now teaches at Darjeeling Mountaineering Institute attended a centenary dinner at the Alpine Club during his stay in England

before his next real chance came

The war years were spent in Chitral serving a British officer. In 1944 his first wife died his two daughters Nima and Pem Pem were now four and five years old. Returning to Darjeeling he married Ang Lahmu the stolid Sherpani to whom he had sold milk many years ago. She had been to England as an ayah in 1938 and now in the lean post war years when expeditions were few and far between she kept the family going

He accompanied Earl Denman on his surreptitious 'lone' journey to Everest and in 1947 made his first trip with Swiss climbers in Garhwal. After the Sirdar was involved in an accident he took his place and for the first time in his life reached the summit of a *big mountain Kedenath 22 000 ft.*

One of his most interesting tours was to Lhasa and to numerous Tibetan monasteries with Professor Tucci the Italian orientalist. Then several expeditions were dogged by misfortune. A French party tried to traverse the two peaks of Nanda Devi and were never seen again. On a rescue bid Dubost and he made the second ascent of Nanda Devi East. This not Everest was his hardest climb

The same year Eric Shipton opened the southern route to Everest and Tensing was Sirdar for the two Swiss expeditions in the spring and autumn of the following year, 1952. By now his growing experience won him a place in the high-climbing teams. In Raymond Lambert he found a great companion—the absence of a common languge was no bar to close understanding and friendship. Together they reached heights as great on the south side of Everest as the British had on the north. In 1953 he came down from Everest with Hillary as a hero to be worshipped—practically deified—by millions throughout India and Nepal. Kings and Prime Ministers honoured him songs and legends have been woven around his name. He became for the ordinary man a real life parable of aspiration and success

Mr P K. Ponomarenko

H E Panteleimon Kondratievich Ponomarenko the new Ambassador Extraordinary and Plenipotentiary of the U S S R to India arrived in New Delhi from Moscow on Tuesday December 10 1957

He was born in 1902 in a peasant family in Kuban region Southern Russia. At the age of 12 Ponomarenko started working in a village smithy. In 1918 he joined the Red Army and took part in the battle against the whiteguards during the defence of Krasnodor South Russia. Beginning from 1919 Ponomarenko worked as a fitter and an engine-driver on oil fields and railways

He graduated from the Moscow Institute of Railway Engineers in 1932. From 1935 to 1937 he was the head of a research group in the All Union Electro Technical Institute.

Since the end of the year 1938 P.K Ponomarenko was in Byelorussia as the Secretary of the Central Committee of the Communist *Party of the Byelorussian Republic. Later* he was appointed the Chairman of the Council of Ministers of Byelorussia. As the *Prime Minister* of the Republic P K Ponomarenko made great contribution to the reconstruction of the economy of Byelorussia which was damaged by the Hitler army during the war

In November 1950 P K Ponomarenko was appointed the Minister of Procurements of the U S S R and from 1953 to 1954 he was the U.S S.R Minister of Culture

In May 1955 P K Ponomarenko was appointed the Ambassador Extraordinary and Plenipotentiary to Poland which position he held till recently. He is a deputy of the U S S R Supreme Soviet and a member of the Central Committee of the C.P S U. For his significant services to the Soviet State P K. Ponomarenko has been awarded the Order of Lenin and other orders and medals

Mr Dalip Singh Saund

India born American 58 years old Dalip Singh Saund a member of the Congress of the United States came on a goodwill tour to his native India in December 1957 after 37 years. During his three-week stay in India Mr Saund visited his home town (Amritsar) Delhi Bombay, Madras and many other places

Dalip Singh Saund the son of an Amritsar Sikh farming family, graduated from the University of Punjab and then went to the University of California to study for a Doctor of Philosophy degree in mathematics in 1919

After graduation Mr Saund spent several years writing and speaking for Indian independence. As soon as he obtained his degree

Mr Dalip Singh Saund

India born American 58 years old Dalip Singh Saund a member of the Congress of the United States came on a goodwill tour to his native India in December 1957 after 37 years During his three week stay in India Mr Saund visited his home town (Amritsar) Delhi Bombay, Madras and many other places

Dalip Singh Saund the son of an Amritsar Sikh farming family, graduated from the University of Punjab and then went to the University of California to study for a Doctor of Philosophy degree in mathematics in 1919

After graduation Mr Saund spent several years writing and speaking for Indian independence As soon as he obtained his degree

he married a fellow student Marian Kosa and started farming in the fertile Imperial Valley He became active in local Democratic political affairs and in 1942 became first president of the Indian Association of America In 1949 he became an American citizen and a short time later was elected to the local office of Justice of the Peace

Nearly 60,000 America voters in California's 29th Congressional District Nov 6 1956 elected Judge Dalip S Saund, to represent them in the U.S House of Representatives

Mr Saund offered himself as a Democratic candidate for Congress in the November 1956 elections Defeating his opponent aviatrix Jacqueline Cochran Odlum (the famed woman flier who was the Republican nominee) M Saund was elected to the U S House of Representative from the 29th Congressional district of California by a comfortable majority He considered his election a tribute not to himself but to the clear thinking of the American electorate and to the continued broadening of American political thought.

Maulana Hussain Ahmed Madni

Maulana Hussain Ahmed Madni well-known Muslim theologian and head of the Dar ul ulum Deoband died on December 5 1957 He was aged 83

In the struggle for India s freedom Maulana Hussain Ahmed Madni s services will always be remembered When he was still very young his father left his native place Faizabad and the whole family settled themselves in Madina in Hejaz Maulana Hussain Ahmed Madni finished his education there and began his career as a teacher of theology in Madina

During World War I when Maulana Mahmudul Hasan Deobandi went to Hejaz, he met him there and began to live with him as a disciple At the time when Maulana Mahmudul Hasan was arrested by the Sharif Husain of Hejaz and was handed over to the British Government, he was also arrested and both of them were sent to Malta At the end of the war both of them were set free and they came to India This was in 1921 and since then until his death Maulana Hussain Ahmed Madni devoted his entire life to the cause of India s freedom

He joined the Indian National Congress and was among the first rank leaders of the Congress in U P Whenever the Congress started any movement Maulana Husain Ahmed Madni always and without any hesitation supported it and underwent imprisonment several times

After 1937 when the Muslim League started i s opposition to the Congress movement, many a Muslim became shaky in their convictions but he was firm in his determination and stood like a rock. Nothing could shake him from his resolve to fight for the party he had chosen

Amongst the Muslim leaders of India Maulana Hussain Ahmed Madni enjoyed a very high position and his death has l ft a vacuum which it will be very d fficult to fill

Foreign Events

Coalition Government in Laos

The National Assembly in Vientiane approved on December 19 the formation of a Coalition Government which included representatives of the Pathet Lao group a pro communist party which had been holding out in the two Northern Provinces of Sam Neua and Phong Saly

Since the Geneva Agreement of 1954 that ended the war in Indo China representatives of the Royal Government and Pathet Lao had met several times to come to an agreement The Geneva Agreement had urged the integration of the two provinces in the Kingdom and of the Pathet Lao forces—which sided with Dr Ho Chi Minh of North Viet Nam in the struggle against France—in the Laotian Army However successive negotiations had failed

The country has had virtually a political crisis since May 1957 when Premier Souvanna Phouma was forced to resign because the Assembly disapproved of his negotiations with Pathet Lao He returned to power after two nominees for Premiership failed to win the Assembly s support. When he returned to power the second time on August 9 Prince Phouma said that his programme was to form a new Coalition Government with Pathet Lao and hold elections in January 1958

Under the latest agreement approved by the National Assembly on November 2 he entered into an agreement with his half brother Prince Souvannavong who heads the Pathet Lao the two Provinces would be brought under the national administration

On November 18 the Pathet Lao leader symbolically handed over to a representative of King Sisavang Vong the two Provinces

The following day (November 19) Prince Phouma announced the formation of the 16-member Coalition Government in which Prince Souvannavong was made the Planning Minister and another Pathet Lao representative Mr Phouma Vong Vichit became Minister of Protocol and Education The National Assembly passed a vote of confidence in the new Coalition Cabinet later the same day

Iran s Claim to Bahrein Island

On November 12, the Shah of Iran instructed his Cabinet to present a Bill to Parliament making Bahrein Island a British protected State in the Persian Gulf a province of Iran

The Island with an area of 200 square miles and a population of 1 20 000 is an important oil centre with a big refinery The local Ruler, Sheikh Sulman bin Hamad Al Khalifa is advised by British officials Bahrein has been under British protection since 1861

A British Foreign Office spokesman said in London on November 13, 1957 that British Government would continue to fulfil its obligations to safeguard the independence of Bahrein

Reading from a prepared statement to the Press he said Bahrein is of course an independent Arab State under British protection Iran has often in the past staked a claim to Behrein on historical grounds But the British Government have repeatedly made it clear that they consider the Iranian claim to be unfounded

A spokesman of the Arab League said in Cairo on November 14 that the League was opposed to the Iranian claim of sovereignty over Bahrein He said that Bahrein was clearly an Arab territory The Syrian Government took a similar stand

Background In the course of their Eastern adventure the Portuguese occupied Bahrein in 1507

They were however driven off by the Arab subjects of Iran in 1602 The Iranians ruled the Island intermittently from 1602 to 1782 They were expelled in 1783 by the Utub Tribe from the Arabian mainland whose paramount family the Al Khalifas, became the independent Sheikhs of Bahrein in 1810

At various times, the Sultan of Oman, the Wahabi Arabs the Turks and Iranians laid claim to the Island As a result of these claims the Sheikh of Bahrein signed a Convention with Britain in 1861 acknowledging the validity of earlier treaties and conventions and promising to abstain—in return for the support of the British Government against external aggression—from ' the prosecution of war piracy and slavery by sea

Uunder exclusive agreements between Britain and Bahrein in 1892, it was agreed that

the Sheikh would 'on no account cede sell mortgage or otherwise give for occupation any part of his territory to the British Government

Petroleum was discovered in Bahrein in 1932 Royalties on it are paid to the Sheikh by the Bahrein Petroleum Company a British concern registered in Canada but affiliated to the Standard Oil Company of California and the Texas Oil Company

ETHIOPIA First General Elections

The first general elections in the history of Ethiopia took place between September 11 and October 10, 1957, to elect a Chamber of Deputies of 210 members In accordance with the new Constitution promulgated in 1955 by the Emperor Haile Selassie on the occasion of his silver jubilee the elections were held by universal direct and secret ballot All native born Ethiopian citizens over the age of 21 both men and women, were eligible to vote except for individuals who had been deprived of civil rights or imprisoned on criminal charges Candidates were required to be at least 25 years of age to be Ethiopian nationals by birth, and to possess a property qualification—possession of immovable property to the value of at least 1 000 Ethiopian dollars (about £40) or of movable property to a value of at least E $2 000 In addition candidatures had to be supported by at least 50 registered voters and the candidate himself was required to deposit E $250 (about £36) which was forfeited if he received less than two per cent of the votes in his constituency

For the purpose of the election the country was divided into 95 electoral districts each containing approximately 200 000 inhabitants Each district was represented by two deputies while cities with a population over 30 000 were entitled to one deputy, plus an additional deputy for each 50 000 inhabitants in excess of 30,000 (e g Addis Ababa with an estimated population of 400,000 was represented by eight deputies) As there are no political parties in Ethiopia the candidates campaigned on their personal records A total of 491 candidates stood for the 210 seats including several women In view of the high rate of illiteracy the electors voted by dropping coloured cards into boxes over which the photographs of the various candidates were displayed The total number of votes cast was 3 015 260 out of an electorate of approximately 6 000 000

The new Chamber of Deputies met for the first time on November 1, 1957, by which date 190 members had been elected (including two women) with 20 results still outstanding On the same day the Emperor nominated a Senate of 35 members most of them officials experienced in government and administration The Prime Minister, Bitwoded Makonen Endalkatchaw was appointed President of the Senate and given the title of Ras—corresponding to a peerage He had been premier of Ethiopia since the country was liberated by British forces in 1941

Under the new Constitution the Emperor retains the prerogative of appointing the Senate in addition to the direction of foreign affairs and supreme authority over all internal affairs as Head of State

EGYPT JORDAN—Press and Radio "War"

The Egyptian press and radio launched a violent propaganda campaign against the Jordanian Government and King Hussein personally from the beginning of November leading to equally strong attacks on President Nasser and the Egyptian Government from the Jordanian side The intensity and violence of this press and radio 'war in which Syrian propaganda organs also joined in the attacks on Jordan led the Kings of Saudi Arabia Iraq and Libya to issue personal appeals for a cessation of recriminations between the countries concerned

The Cairo newspaper *Al Shaab* accused the Jordanian Government on November 3 of having entered into secret negotiations with Israel alleging that the Jordanian Foreign Minister (Mr Samir Rifai) had had "a secret meeting at Nablus on September 14 with the Israeli Prime Minister Mr Ben-Gurion, and the Foreign Minister, Mrs Meir (An Israeli Government spokesman described these allegations as nonsense) The allegations were repeated by Cairo Radio which bitterly attacked the Jordanian leaders and accused King Hussein of accepting a 'bribe of $30 000 000 from the United States

The Jordanian Government issued a statement on the following day (November 4) denying the *Shaab* allegation as a complete lie and accusing Egypt herself of entering into secret negotiations with Israel After saying that the Jordanian Government possessed ' quantities of evidence to prove that 'responsible Egyptians are carrying out secret communications and contacts with the Israelis, the statement accused Egypt of treason to the Arab cause and her rulers of political and moral degradation The Jordanian radio

HOME AFFAIRS

Debate on Foreign Policy

The Rajya Sabha on December 12 1957 unanimously endorsed the foreign policy of the Government of India This was on a motion by the Prime Minister Shri Nehru who in a 60 minute survey of international affairs also dealt with some specific issues including Kashmir Goa and Algeria Referring to the latest resolution passed by the Security Council the Prime Minister said India did no accept this resolution although it did not contain most of the objectionable features of the earlier draft While Dr Graham would be welcome to come to India it had been made clear that this visit should not be considered as some kind of a continuation of talks on the old lines of what was called demilitarisation and so on The Prime Minister paid tribute to Shri Krishna Menon for stating India s position about Kashmir with fullness and clarity

On Goa Mr Nehru said this colonial possession was an amazing anachronism Goa was no problem from the military point of view but India tried patiently to find a peaceful solution and had refused to adopt any forcible or military measures Portugal had discovered some kind of pen friend in the President of Pakistan who had recently visited Portugal They had been supporting each other in various matters

He said that we will have to follow an integrated policy and nothing could be done in Goa which was against India s policy anywhere else He also referred to those Portuguese possessions which had liberated themselves and said we want them to come through some normal process and added that constitutionally we do not want to take step only in Nagar Haveli but for the whole of Goa

He referred to the French possessions and said that the Government of India had been informed that in the next few weeks or a month or so the French Parliament would take final steps for the *de jure* transfer of these possessions Referring to Indo-Pakistan relations the Prime Minister said that ours had been a friendly approach and would continue to be so That the people of India and Pakistan should be friendly was inevitable because nobody could change the geography history culture and other traditions common to the peoples

Referring to the larger issue of war or peace in the world the Prime Minister said that while the world situation was not without hope it was still grave It called for an approach of reconciliation an approach that laid stress on common points and common danger instead of differences Already the world had seen too much of the cold war approach based on fear prejudice apprehension and passions Mr Nehru welcomed the Soviet Prime Minister s reply to his personal appeal to Big Powers for suspension of nuclear tests He said he was grateful to Mr Bulganin for dealing with this matter at this length and said the reply he had received from him naturally deserved fullest consideration A new approach should be made towards the solution of the problem of world peace

Later replying to the debate on December 13 the Prime Minister refuted certain Western suggestions that Indian policy was motivated by fear of Russia and China and declared that there was not the remotest chance of India being afraid of Russia or China or India having any kind of military conflict with Russia or China

Referring to India s policy of non alignment the Prime Minister said that if some people thought that this policy was too idealistic it would be those who lived in a realm of imagination divorced from facts The policy was strictly practical He would venture to say that other countries great or small were bound to come to this policy of non alignment because the only alternative to that policy was the cold war The Prime Minister added that probably the Member who described the policy as cowardly was thinking of and obsessed by the idea of Pakistan and probably thought India was weak and appeasing I would like to make it perfectly clear that holding to our principles and vital interests we want to appease everybody I am not afraid of appeasement provided the appeasement does not involve principles or vital interests I want to appease because I want to make friends with all

Naga Hills Unit

The Governor of Assam Mr Fazl Ali

took over the administration of the new Naga Hills Tuensang Area—on behalf of the President of India on December 1 1957

In a message on the occasion he sought the co operation of all Nagas in discharging his new duties He also warned those who were still bent on creating trouble and said "We shall not hesitate to use whatever measures are necessary against those who persist in defying the law

The President, Dr Rajendra Prasad signed on November 29, the Bill passed by the two Houses of Parliament amending the Sixth Schedule of the Constitution for establisehing the new Naga administrative unit as Union Territory The Lok Sabha (House of the People) passed the Bill on November 25 and the Rajya Sabha (Council of States) on November 28 1957

The unit will be administered by a Commissioner and three Deputy Commissioners on bahalf of the Governor of Assam and in the name of the President of India

Mr P N Luthra was appointed the first Commissioner of the area

The unit will be known as the Naga Hills -Tuensang Area It covers an area of 6 236 sq miles with a total population of about 3 50 000 It includes the former Naga Hills district of Assam and the Tuensang Frontier Division of the North East Frontier Agency It is divided into three districts—Kohima Mokokchung and Tuensang—each under a Deputy Commissioner

This new unit to be named The Naga Hills Tuensang Area would be administered by the Governor as the Agent of President but would be distinct from the North East Frontier Administration Paragraph 20 of the Sixth Schedule to the Constitution was amended and certain consequential amendments of the Delimitation of Parliamentary and Assembly Constituencies Order 1956 and the Representation of the people Act 1950 were carried out

Provision was made in Clause 5 of the Act for an additional nominated member in the Lok Sabha (House of the People) to represent the new unit

On the constitution of the unit the Central Government would bear the entire cost of the administration of this territory Of this the Tuensang area already being Centrally admi ... as part of the North East Frontier would not impose any new financial on the Central Government

The Naga Hills district, however is at present an autonomous district of Assam and the expenditure incurred in respect of this district by the Government of Assam would now pass on to the Central Government

The annual budgeted expenditure of this district is Rs 4 88 crores at present The Central Government already bears a large part of this expenditure It is roughly estimated that the extra financial burden which would fall on the Government of India would be about Rs 3 crores a year

The creation of the new Naga unit directly under the Government of India thus meets the essence of the demand for special administrative treatment of the Naga area without any interference from the Assam State Government The demand had taken the form of an extremist slogan for independence for the area Its leader was Mr A Z Phizo who subsequently resorted to arms to bring about the so called independent Naga homeland The Government of India had to move in troops to restore order and protect the loyal Nagas

Subsequently when order was partially restored the more responsible tribal leaders of the Naga area held a Convention in Kohima and put forward the demand for a separate administrative unit directly under the Government of India The Prime Minister Mr Nehru invited a Naga delegation to New Delhi to discuss the matter and promptly accepted the demand Mr Nehru also announced an amnesty for all offences committed by the Naga hostiles

Preventive Detention Act Extended

The Lok Sabha on December 10 1957 passed the Home Minister s Bill extending the life of the Preventive Detention Act by three more years Moving the Bill Shri Pant pointed out that for the cultural economic and spiritual advancement of the millions of people of this country it was necessary that there should be peace in the land For this purpose Government had sometimes to adopt methods which curtailed the liberty of individuals so that the mass of the people might enjoy their liberty The Preventive Detention Act was designed to save people from doing mischief to others and inviting danger to themselves Mr Pant referred in this connection to language agitation in the Punjab, the activities of the Dravida Kazhagam in Madras the recent incidents in Ramanathapuram and bomb and crackers used from time to time to create terror and injure people.

Later, replying to the seven hour debate on December 11 the Home Minister justified the continuance of the Act for another three years in the interest of preserving law and order peace and tranquillity in the country so that peaceful progress might be expedited and steps taken for bringing much nearer the goal of a welfare State and socialist pattern of society He said the Bill would be justified if a dispassionate view of the difficulties facing the administration in preserving law and order was taken

World Conference of Religions

A World Conference of Religions was held in Delhi on November 17 and 18 1957 The Vice President of India Dr S Radhakrishnan presided

Inaugurating the Conference the President of India Dr Rajendra Prasad made a strong plea for raising the structure of a new human society on the foundations of religiou or spiritual values

The Indian Prime Minister Mr Nehru who also addressed the Conference asked the Indian people to practise in their day to-day life what they believed to be and constantly preached to be the traditional virtues of catholicity and tolerance of religious communities in India Although as he said, he (Mr Nehru) was no expert on religious matters such was the lesson that Mahatma Gandhi taught him He never believed in preaching to people of other countries what he could not persuade the people of India to practise them selves

In his presidential address Dr Radhakrishnan reminded the people of the grave dangers facing humanity at present owing to the invention of dreadful weapons of destruction The world, he said could save itself only by constantly endeavouring to transmute man s intelligence into an illumined spirit

Explaining further he said We are still victims of collective selfishness The need was for not merely a spirit of toleration but positive appreciation of other people s faith and subduing of the appetite for power by universal love and humility

Jain Muni Sushil Kumarji sponsor of the Conference said that lasting world peace could be founded only on truth and non violence In this field India could lead the world He also pleaded for the establishment of an Institute in India for the cultivation of the two principles that would evolve ways of solving world problems on the basis of ahimsa (non violence)

The Conference concluded on November 18

It approved unanimously a resolution calling upon the followers of different faiths to give up mutual dissensions and exclusiveness and strive to bring about mutual respect and co-operation

The resolution said that an effort should be made to discover ways and means of fostering love and brotherhood among men races and nations

It recommended the establishment of an Institute to conduct research in the potentiality of truth love and non violence to bring about peace in the world This Institute should study the humanities and the great spiritual movements through the ages

The Conference set up a committee consisting among others of Kaka Kalelkar and Mr Jainendra Kumar to work out the detail of the Institute

Credit Facilities to Small Industrialists

Financial Assistance over Rs 1 5 crores has been sanctioned by the Government of India to different States and Union territories for providing loans to small industrialists

These loans will be disbursed during the current financial year by the State Governments and the Administrations of Union territories under the State Aid to Industries Act and other regulations in force

Almost all State Governments have liberalised the rules for advancing funds to small industries under the State Aid to Industries Act Loans will be given to bonafide small industrialistists up to Rs 1 000 on a personal bond and up to Rs 5 000 on a security of one or more personal sureties

Loans will be given both for capital expenditure as well as working capital and up to 75% of the value of the security which would include assets created out of the loan

The rate of interest will be only 3% up to a limit of Rs 50 000 for any single party In the case of co-operatives the rate will be 2½%

Loans under the scheme have been given to State Governments since 1954 Up to the end of 1955 56 the Central Government contributed a sum of over Rs 2 1 crores as loans to state Governments against a contribution of over Rs 94 lakhs by State Governments themselves In 1956 57 the States were given loans of about Rs 1 5 crores by the Central Government for this purpose

Of the loans now sanctioned Punjab gets Rs 24 lakhs Bombay Rs 20 lakhs Uttar Pradesh Rs 19 66 lakhs Bihar Rs 10 lakhs Kerala Rs 10 lakhs Madhya Pradesh Rs 9 lakhs West Bengal Rs 8 lakhs Mysore Rs 11 lakhs, Orissa Rs 6 6 lakhs, Rajasthan Rs 6 5 lakhs Andhra Rs 5 5 lakhs, Assam Rs 5 lakhs Madras Rs 3 17 lakhs and Jammu and Kashmir Rs 1 99 lakhs

The Union territories of Delhi and Himachal Pradesh get Rs 4 8 lakhs and Rs 2 lakhs respectively while Tripura and Manipur have been sanctioned Rs 1 91 lakhs and Rs 1 14 lakhs, respectively

In order to channelise financial assistance to small industries through credit institutions the Small Scale Industries Board has suggested that at least 10 per cent of the loans granted by Government to small enterpreneurs should be routed through the State Financial Corporations The Board has also recommended that 10 per cent of the loans granted for working capital should be routed through urban co operative banks and that at least six such banks should be set up in each State by March 1958

The State Bank of India in consultation with the Reserve Bank has initiated a pilot programme to provide credit to small industrial units in nine selected areas i e Bombay Surat Kolhapur Delhi Ludhiana, Agra Madras, Vijayawada and Coimbatore.

The object of the programme is to evolve a procedure for co-ordinating the credit facilities provided to small industries by the various agencies e g , the Government State Financial Corporations State Bank Co-operative Banks and other commercial banks in these areas

Debate on the Second Plan

The debate on the Second Five Year Plan in relation to the current economic situation which began on the last day of the last session of Lok Sabha was resumed on November 20 1957 Speaking in the resumed debate Mr Nehru declared that Government had absolutely no intention of making any radical changes in the structure of the Second Five Year Plan The major things in the Plan would have to go through. He pointed out that they could not stop the big projects that had already been started otherwise there would be a great loss Therefore many of the things in regard to the Plan were final

The Prime Minister did not agree with the that the Plan was over ambitious Planning was a continuing process without breathing space He said the stresses and strains that had appeared now were due to various factors—foreign and domestic. He admitted that with a little more careful planning and with a little more foresight in the matter of our exports and imports the stresses would have been slightly less but that would not have made a major difference to the situation He added that the foreign exchange difficulties which the country faced today would be solved in a year or two

The Prime Minister said that nothing could claim greater priority in the Plan than food production He felt that we should try our utmost to achieve a minimum of additional 15 million tons of food output if not more. Since the yield was low in India there was scope for increasing it. Future progress depended very largely on the work done by the community projects on cooperatives and in the final analysis on the self reliance of villagers

Replying to the debate on the Second Five Year Plan the Finance Minister Shri T T Krishnamachari said in Lok Sabha on November 21 that the core of the Plan would be maintained However if there was any diminution in the Plan of a substantial character he regretted to say that it might have to be in the power projects which had been included in the Plan if we did not get facilities to proceed with these items The Finance Minister stressed that the Government would adhere to the essential objectives and priorities in the Plan and that there would be no change in the core of the Plan

The Finance Minister reiterated the statement of Shri Nanda that the Planning Commission was proceeding on the assumption that the financial ceiling for Plan outlay would be Rs 4 800 crores instead of the increased cost of some of the schemes included in the Plan The Finance Minister said that he was reasonably hopeful that with effort we shall succeed in raising resources to match this target. It was no use suggesting Shri Krishnamachari observed, that there must be a reversal of the gear The chariot goes on The pace will be regulated by the road through which it traverses and the amount of manpower put behind But it will go on There was no question of reversing the gear

The debate on the Second Plan concluded after the Finance Minister s speech A number of amendments tabled by opposition Members to the formal motion for discussion of the Plan were rejected by the House

inance Ministers' Conference

The Conference of Finance Ministers, hich met on November 18 in New Delhi, was tended by the Members of the Planning Com ussion, and was addressed by the Minister of Home Affairs and the Prime Minister The Governor of the Reserve Bank also attended the onference and briefly addressed it The onference concluded the same day

The Union Home Minister, Shri Govind Ballabh Pant, in his speech said that we were ll faced with difficulties today whether at the Centre or in the States It is because we velcome difficulties and we have tried to forge head with determination to get over them hat we have been able to make at least an ppreciable advance

"The right administrative system depends on our solvency and credit worthiness and on he value of the rupee being maintained in act If we fail in any of these then our dministrative system and even the fabric of Government may become insecure The entire dministration has finance as its backbone

'So we must have adequate funds with us nd if we aim high and if we have to achieve lot we can do so only so long as we are able o retain our reputation for solvency and for our bility to meet readily the obligations that may come in our way

'The Finance Commission had now raised the contribution to be made from income tax receipts to the States from 50% to 60% Similarly special subsidies or aids are to be given to most of the States Now the Centre has become the main fountain which sustains the States in full vigour But at the same time it would not be quite right to assume that the Centre has got unlimited resources The more it is compelled to have recourse to the printing press the lesser becomes the value of the rupee The currency is depreciated and even if the States get more money the total worth of that money is less

"Now our Plan has two aspects and so have our finances, internal and external So far as external finances go you know that howsoever able and competent the Finance Minister may be he has to rely on the co-operation of others

But ultimately we have to depend on ourselves We are working for the benefit and uplift of the common man and we have to look to him for succour and aid also

So the system of small savings has to be given the recognition that it deserves, which has been so far regarded as only a subsidiary source but unless it becomes the main source, we will not be able to raise adequate sums for meeting our commitment' The Finance Minister said that the progress of expenditure has to be regulated in a proper way and arrangements have to be made between the States and the Centre so that whatever assistance is to be given by the Centre or to be received by the States reaches them in time and no occasion arises for encroaching upon preserves which should not be disturbed 'Particular care has to be taken not to increase the expenditure on items which do not come within the four corners of the plan

The Conference had before it the result of the discussion by the officials of the State Governments the Planning Commission and the Union Finance Ministry There was a full and frank discussion of the various issues, and revealed a large measure of unanimity in the approach to the various problems posed for the Conference

(*Continued from page 76*)

bitterly attacked President Nasser and other Egyptian leaders applying to them such epithets as dogs crows of evil treason trumpets and "agents of the Kremlin President Nasser himself was denounced as a ' little dictator a slave of Moscow and a "Don Quixote striking right and left with his wooden sword but hitting only himself

During the following week the press and radio war between the two countries reached a new peak of violence The Egyptian press (including the official *Al Goumhouria*) and Cairo Radio described King Hussein as a traitor and accused his Government of allowing Jordan to become a base of American imperialism whilst the Jordanian Press and radio accused the Egyptian rulers of trying to foment dissension and mutiny in Jordan so that the Arab world would be an easy victim for the Egyptian s masters in Moscow The personal attacks on King Hussein were bitterly resented by the Jordanian press which accused Egyptian newspapers of ignoring the ethics of journalism and prostituting their profession

Speaking at a press conference on November 13 King Hussein described the present rulers of Egypt and Syria as 'tools of international Communism '

King Saud of Saudi Arabia and King Faisal of Iraq urged the Egyptian and Syrian press and radio on November 14, to cease attacking Jordan declaring that such campaigns would 'benefit only the enemies of Arabs and Moslems ' King Idris of Libya also appealed on November 18 to the Goverments and peoples of Egypt Syria and Jordan to cease recriminations for the sake of the dignity of the Arab nation Although there was no official response to these appeals the Egyptian press and radio made little or no reference to Jordanian affairs after mid November and ceased its attacks on King Hussein and the Jordanian leaders

EDITORIAL

INDIA—A UNIQUE REPUBLIC

January 26 is a day of unique significance in the annals of our history On this day eight years ago India became a Republic and adopted her new constitution which is declared as one of the best in the world The achievement of freedom or making the constitution was not the work of one individual or a party but it was the consolidated effort of the whole nation spanned into many years that gave shape to the greatest Democracy in Asia Our struggle for freedom was unique as it was based on non violence and passive resistance to foreign domination India was the first country to win her independ nce by peaceful means and not by bloody revolution

When the British left India on 15th August 1947 leaving behind them a trail of political chaos by dividing the sub-continent India had to face seemingly insurmountable problems such as the rehabilitation of hundreds of thousands of refugees who poured into India from the newly created Pakistan and the incorporation of more than six hundered Princely States into the polity of India The shock of partition the problems of language and religion and social and economic problems had to be faced All these problems had to be solved within a short time so that India could enjoy the fruits of her newly won freedom Hardly had the great work of reconstructing India begun when Pakistan invaded Kashmir using the tribal people as spear head Any other nation would have succumbed under these hardships but India stood like one man and bravely faced the situation Within less than three years of becoming independent India not only surmounted her difficulties and solved many of her internal problems but also she performed the gigantic task of writing and adopting a Constitution which came into force on January 26 1950 when India proclaimed herself a Sovereign Republic Not only was the Constitution unique but the Republic was of a distinctive nature We struggled agitated and made sacrifices to get rid of the Brit sh rule in India but when India became free and sovereign she chose voluntarily to remain within the British Empire ! Britain to accomodate India had to drop the word British and to change the word 'Empire

into 'Commonwealth Later on many other nations like Ceylon Pakistan Malaya Ghana etc who won freedom followed the precedent of India and became members of the Commonwealth of Nations The utility of remaining in Commonwealth is a moot point but one thing is clear—India has no ill will against her erstwhile rulers India's sovereignty is in no way impaired by her attachment to Commonwealth Rather she has won the respect and gratitude of the British nation

Unique Constitution

Indian Constitution is a unique mixture of *the various constitutions* of the world It incorporated all that is good in the constitutions of Great Britain U S A Australia and Japan. This Constitution has recognised the fundamental and basic rights of a citizen such as right to property culture and education and free association and it has provided for the citizens of the country justice in social economic and political spheres liberty of thought and expression of belief faith worship and equality of status and opportunity Rights without remedies are of no use Our Constitution has made a provision for this also *Article 32* guarantees to every individual the right to move the Supreme Court by appropriate proceedings for the enforcement of his fundamental rights The Supreme Court acts as the guardian of our Constitution as it has the power to pronounce judgment on the validity of laws passed by Central and State legislatures and the protector of the fundamental rights of the citizens

Part fourth of Indian Constitution embodies the provisions relating to directive principles of State Policy based on social justice These principles require the State in the national sphere to frame its policy in such a way as to promote the welfare of the people of India and secure for them a social order in which there is justice—social economic and political. The Constitution provides for all the requirements of a truly democratic Welfare State and the Government is doing its best to make India a welfare state based on the socialist pattern of society

Democracy In Action

Our Constitution is one of the most outstanding democratic constitutions of the world There are three broad aspects from which to judge whether democracy is successful in action. They are (i) the Rule of Law (ii) Parliamentary Government and (iii) Democratic

If the success of a democracy were measured in terms of the way in which the rule of law is maintained Indian democracy has been very successful The Constitution has been honoured the fundamental rights have been upheld, the courts have not been slow to assert their independence and on the whole the people have submitted cheerfully to the decisions of the courts

Our Parliament and State legislatures have functioned with effect and with dignity The people have respected the Parliamentary decisions and generally kept away from attempts to sabotage Parliamentary democracy During the last two General Elections the people have demonstrated their love for parliamentary democracy The elections the largest in recorded history passed off peacefully All parties had a fair chance of testing their strength and the people cast their votes voluntarily freely and without pressure from any side

The term "democratic decentralisation implies that (i) in a democracy the administrative machinery has to help and not hinder the growth of the popular initiative and (ii) the opinions and the decisions of the ruling party should not be imposed from above

There have been many welfare programmes in which the public have freely and voluntarily participated such as the Bhoodan movement and the *Community Project* programmes The Government has helped by giving loans and technical advice, to establish various small *scale industries*

In our legislatures the members are not bound to toe the party line Members of the ruling party are free to vote even against the Government The Central Congress Government does not impose its decisions or opinions on States with Congress Governments This freedom of views is not allowed in the Communist Party but in India the Communist Party is also following democratic methods In Kerala the Communist Party has formed a Government after winning the majority of seats in the State legislature through ballot box and not through conventional revolutionary method For the last one year the Communist Government of Kerala has shown every respect for the Indian Constitution and so far there has been no clash between the Central Congress Government and the Communist Kerala Government This is a unique instance of co-existance in democracy

Economic And Social Progress

Not only in political democracy, India

has also rapidly advanced in economic and social spheres Soon after we became master of our own destiny we decided to usher the desired era of welfare happiness and pros perity in this country We began the task of establishing a welfare state in the country and moulding the economy of the country on a socialist pattern with the definite objective of increasing production, raising the standard of living and providing work and employ ment to millions of people We launched the first Five Year Plan which was fully imple mented in 1956 The targets of production and progress fixed in the first Plan were achieved in certain cases the results being an improvement on the targets Our national wealth has increased in agricultural products we are becoming self sufficient.

It is however in the countryside India s out-of the way and far flung villages that a silent but real revolution has taken place Our villages today are in a state of ferment The Community Development Programme and the National Extention Service have widened the mental horizon of our village folk who are lending full help and cooperation to the administration in changing the face of rural India Ill health ignorance and poverty which have been chronic factors of rural India are being wiped out by N E S and C.D Prog ramme Villagers are sheding old prejudices and learning to help themselves with new implements and fresh ideas It is the pros perity of this section of the community which is our foremost hope because villagers account for about three fourths of India s population even today

The success of the first Plan has inspired us to frame and launch an even more impres sive and ambitious Second Five Year Plan The second Plan lays emphasis on heavy industries as a basis for future industrialisation Alongwith the establishment of heavy indust ries small scale industries are also being revived and encouraged Though there are some temporary initial hardships in carrying out our ambitious programmes it is hoped these shall be surmounted and the second plan will also end successfully

Unique Foreign Policy

India is not unique only in her democratic Constitution or in the rapid achievement of economic prosperity but she has also adopted a unique foreign policy India is a friend of all and enemy of none She is not aligned to any big Power she is neutral in the cold war of [illegible]

world has any quarrel with India s foreign policy and actually many of them have shower ed positive praise on it It is a matter of pride that to-day India occupies a position of honour among nations of the world The Panchshila or famous five principles symbolise India s foreign policy and her positive approach to world problems Her voice is heard with respect and she is gaining recognition as a powerful force working to promote peace and harmony throughout the world She is striving to-day to bridge the gap between the East and the West and to reduce tension and discord between them Maintenance of world peace is one of the corner stones of India s foreign policy This is allied with her policy of friendship with all nations and non alignment with any power bloc It is a mistake to think that India stands isolated because of her non alignment policy Everywhere in the Eastern countries they have begun to understand this policy of non alignment Lately in the Western world as well there has been an increasing understanding not merely of our position but the potentialities of our policy for bringing good results In the light of our principles and deep rooted convictions we are able now and then to make our humble contri bution to the maintenance of peace amity and goodwill among nations India s policy of non alignment with power blocs is of positive value in the world in that it allowed her to be in an 'in between position with both said Mr Hugh Gaitskell leader of the Opposition in the British House of Commons, in New Delhi

India is opposed to the creation of military pacts and blocs which in her opi nion are the cause of international tension and distrust among nations and only serve to increase them. Any conflict between the great powers in this atomic age would mean the complete annihilation of humanity That is one of the reasons why India refuses to be drawn into one bloc or the other

With the success of India s foreign policy based on Panchshila many Asian countries have adopted this policy and even the Western countries have come to realise the advantages of this policy though they have actually not adopted it

Maintain the Progress

Thus within a short time of ten years which is insignificant in the history of a na tion India has not only gained stability in economic sphere but she has won laurels in

come one of the leading power in Asia and her wolds carry weight in international consultations Though our achievements are great and worthy to be proud of we should not sit complacent and gloat on our success This is only the beginning and there are great tasks to be performed As the largest democracy in the world the eyes of all Asia are focused on its successful working It should be our determination to ensure the steaday progress of our cuntry while maintaining our democratic ideals

DID YOU KNOW ?

Antarctica s massive burden of ice may be responsible for depressing the land beneath it At one place recent measurements have shown the ice to be 9,750 feet deep with the underlying land 5 000 feet below sea level

The Free World disarmament proposals presented at the London UN talks in August 1957 were unanimously endorsed by 15 nations Belgium Canada Denmark Federal Republic of Germany France Greece Iceland Italy, Luxembourg Netherlands Norway Poland Turkey the United Kingdom and the United States The Soviet delegates rejected the proposals without reading them.

Man has tried to beat the heat for centuries. Some primitive tribes for in tance faced their crude huts into prevailing winds and hung reed mats across the entrances which they sprinkled with water creating a form of air conditioning

UNITY AND DIVERSITY OF LIFE

By Prof J B S. HALDANE

The world renowned scientist Prof Haldane delivered three lectures in the Patel Memorial series organised by A I R in New Delhi In his second lecture delivered before a large audience in Vigyan Bhawan on December 16 1957 he posed the question Can we find the evidence that animal minds are like human minds?' Following is a summary of this thought provoking lecture

We cannot prove that animals are conscious I believe that a cow or a bird is conscious We can however prove that animals have behaviour which we call moral or social when we find it in men

Marriage is one of the most fundamental of human institutions Does it exist in animals?

I define marriage as the association of a male and female for economic as well as sexual purpose *artha* as well as *Kama* preceded by a ceremony and normally lasting at least until the children no longer need parental care Clearly many animals do not marry in this sense But even so some elements of human marriage may be found in unexpected animals.

In my laboratory in London we used to breed a little fly *Drosophila subobscura* weighing less than a milligram That is to say 10 crores of these flies would weigh as much as a man If you put a male and an unmated female together in a small glass tube they soon meet. The male stands in front of the female and flicks his wings in a characteristic way She then begins to dance with rapid movements to right and left If the male can follow her motions and remain facing her for a minute or so they usually kiss with the ends of their probosces and the female permits mating But many males cannot dance adequately and are kicked off if they try to mate

In this species a female will never mate again on the same day If she has not begun to lay fertile eggs she will mate again next day But if she has once started laying fertile egg she will hardly ever mate again even after thirty days which is about the equivalent of thirty years of human life for these flies usually live more than a month but rarely as long as three months The males however show no such fidelity Clearly we have here some of the elements of marriage, but not perhaps the most

Marriage is seen at its best in birds Our small English song birds have a fairly general pattern Early in the spring a male bird occupies a territory by singing vigorously along its boundaries and perhaps occasionally fighting intruding males

Unmarried females listen to the song and look at the male and his property If the female flies away the male does not chase her If she stays he makes various songs and postures to the female and gives her food This is often called courtship but as we see this phrase is misleading

Birds and Bees

Most of our small British birds are monogamous But Mr Salim Ali an expert on Indian birds tells me that an industrious male Indian weaver bird may make several nests, and induce a different wife to live in each of them

Mammals do not furnish such good examples of monogamy They tend to group themselves in units larger than the family of two parents and their children. This is of course a step towards the evolution of society but it is hard to reconcile it with monogamy

Now it is curious that in popular speech at least in Europe (I don t know whether it is so in India) such words as animalism' are used to mean sexual promiscuity I think this is because few of our domestic animals are monogamous The most nearly monogamous is the domestic pigeon But there is no doubt that domestication has corrupted our cattle sheep and so on

A few species of fish contract marriages after a fairly elaborate ceremonial courtship and are usually faithful when offered a further choice of mates This kind of behaviour is almost confined to fish living in lakes or slowly moving rivers A pair once separated in the ocean or in quickly moving river are unlikely ever to meet again

I recall an experience at the Fisheries

shown a pair of *Tilapia mozambiquensis* a fresh water fish of African origin which is bred in tanks in Indonesia and whose introduction into India is being considered One of the workers poked a fish with a stick, and it immediately spat out a hundred or so of its children from its mouth If it had been caught the children might have escaped It later took them into its mouth again where of course they would have been safe from other fish Casual observation of such fish has given rise to the quite untrue legend that they breed from their mouths

Some animals are models for moral behaviour We may say that their conduct is instinctive not moral, behaviour It is not possible to draw a sharp line between instinctive conduct and moral conduct But some one may say that even if animals have laudable instincts they have nothing like human intelligence and in particular nothing like human language which requires intelligence to use

Scientific Discoveries

I think that only two of the discoveries of this century in physics are of really profound philosophical importance

One is Einstein s discovery that time and space are aspects of the same kind of relationship The other is that of distinction between two particles of the same kind such as electrons is not absolute We have not yet got the words to formulate this principle adequately But the principle helps me to believe that the distinction between you and me or the nearest mosquito and me is nothing absolute either

Frisch discovered that hive bees had a language and managed to understand at least some of it. His conclusions might not be true of Indian bees

A beehive is a family whose mother the so-called queen (but perhaps goddess would be a better metaphor) may live for some years The workers only live for about six weeks in summer The first three are spent on duties in the hive the remainder in gathering food and occasionally water and a kind of cement which is used in building The foraging bees fall into two classes. About one in twenty looks for new sources of food the others go where they are told As all the bees in a hive are usually sisters we do not know how the distinction arises

If a bee has found a plentiful source of sugar water offered by a professor within 50 yards of the hive she flies back and dances round and round on the vertical surface of a honey comb Other bees follow the dancer, smelling her back with their antennae Few bees work for more than eight hours a day

The bees' dances consist of straight runs in a certain direction ending with a turn to right or left and another run along the same path. During the run the bee waggles her abdomen.

These dances were described by Greek philosopher Aristotle 2 200 years ago, but it was Frisch who discovered that they were a language

If the straight part of the dance is vertically upwards this means that the food is in the direction of the sun If it is 30 degrees to the right of the vertical it means that the source is 30 degree to the right of the sun, that is to say in the northern hemisphere north of the tropics, 30 degrees to the west of the sun. The distance is signalled in two ways The number of turns per minute goes down as the distance increases and the number of abdominal waggles in each straight run increases by about one for each 75 yards of distance However what is communicated is not distance, but time or effort For the dance is slower and more waggles are made, when the source is up the wind or uphill

Lindauer s Discoveries

But the most startling discovery of all concerning communications was made by Von Frisch s pupil Lindauer When a hive becomes over populated some of the bees leave it usually with the old queen while one of her daughters replaces her The swarm may hang on a branch for several days Bees fly out from it looking for a site for a new hive

When they have found one, perhaps in a hollow tree or in the roof of a house they report back and signal the direction and distance by dancing on the swarm Other bees fly out, and if they are satisfied they signal the location to others A bee may change its mind or if others do not agree with it may retire from politics into the middle of the swarm Lindauer gives the records of several debates of this kind which lasted for more than a day Usually unanimity is reached But a swarm may split in two If so the goddess goes off in one half and the others follow her later

This is, I think a really great discovery Here is a highly organized community with no private property It is a socialistic society

But it is not a dictatorship or tyranny ruled by one individual Nor does it show any sign of being ruled by a group soul, as theosophists hold On the contrary there is a diversity of opinions, and one of these finally prevails not by violence but by persuasion.

I describe the bees opinion of human beings thus 'These large creatures are clearly very stupid, and have no real language Many of their dances are crudely erotic However, in Southern India some precision has been reached But even here the *mudras* appear to signal emotions rather mental than facts There is not the faintest evidence that they can communicate either direction or distance

Now I want to pass to another aspect of the unity of life the cooperation between different species The antagonism is obvious enough. Animals eat one another besides eating plants But the co operation is usually between very different kinds of organism. I shall just give two examples When we speak of a rat we are apt to forget that the rat includes crores of bacteria with independent lives of their own which live in its intestine However it is possible to rear rats aseptically with no bacteria in them At most the bacteria provide some substances of which there may be a shortage in the rats food Probably a man could get on without bacteria though again he would have to see that his diet was complete in certain respects But a cow or a horse could not live on anything like their normal diet without bacteria and protozoa

A cow can live on grass You and I cannot. She spends a lot of time chewing the cud which she brings up from her stomach to her mouth thus aiding the protozoa and bacteria in their work Similarly, termites (white ants) cannot digest wood, but they contain protozoa which can do so

We are much too apt to think of protozoa and bacteria are responsible for diseases such as malaria and cholera Most of them are harmless And they play an essential part in the cyclical changes which matter undergoes in the community of living organisms by converting dead plants and animals into chemical substances which the higher plant can absorb from the soil and make once more into living matter

Sex in Flowers

Many flowers are self sterile What is more a self sterile plant is generally a member of a *gotra* no members of which can be crossed with other members I use the word *gotra* not out of condescension to an Indian audience but because there is no English word for such a group Membership of a *gotra* is determined both by the mother and father, and the discovery of the rules by which this is done was one of the most beautiful achievements of genetics

When a bee visits a flower it finds certain colours shapes and odours satisfactory It may also drink the sugary secretion of the flower, the so-called nectar or gather some of its pollen to store in the comb

If it then visits another flower of the same species, it may leave some pollen in it and cause a sexual union of the two plants which engenders one or more seeds We may say that the love of the plant is the bee s aesthetic emotion the lust of the plant is the bee s hunger This point of view should not I think be quite novel to those who have read the *Yoga Vasistha* or the philosophy of Josiah Royce

If a long lived celestial being has visited our planet once in every ten million years or so he would have seen the first trees some three hundred million years ago They were like our trees ferns pines and so on and the herbs beneath them not unlike our ferns

It is not quite a metaphor to say that the monkey s pleasure in eating fruit is the mother love of the fruit tree All this co-operation is of course shot through with evil or at least what appears to men as evil so long as we can use this word meaningfully Insects for example may eat the fruit without transporting the seeds But it is nevertheless true that for most of a hundred million years or so the ancestors of the human race seem to have been co-operating with some of the higher plants eating some of their fruits and seeds and scattering others

Of course this co-operation was unconscious As soon as it became conscious, agriculture started But there had been a long preparation for it

By the way please don t think that no animals practise agriculture Some Brazilian ants collect leaves which they take underground into their nests and on which they plant a fungus which they eat

WORLD IN 2057 A.D.

A symposium on what the world may be like in 2057 A.D was held in New York on December 23, 1957 More than one thousand leading industrialists financiers and educationists including a panel of seven of America's leading scientists, participated in it Following are excerpts from the statements of some of the participants

DR Hermann J Muller one of the world's leading geneticists and holder of a Nobel Prize for medicine and physiology predicted that Man in 100 years time will be able to give his children the assets of the best mental, physical and emotional characteristics of long dead world figures by the use of *frozen* reproductive cells kept in *life banks*

Dr Muller said 'It will be possible to bring the reproductive cycle under regulation to prescribe the sex of the child and to produce at will twins either identical or fraternal or still more multiple births

'It will also be regarded as a social obligation to bring into the world human beings as favourably equipped by nature as possible rather than those who simply mirror their parents peculiarities and weaknesses as closely as possible

'Foster pregnancy already possible will be readily achieved and widely welcomed in addition to natural pregnancy This will provide the opportunity of bearing a child resulting from the union brought about under the miscroscope of the productive cells, both of which were derived from persons who exemplified the considered ideals of the foster parents

'The reproductive cells will preferably be derived from persons long deceased so as to reach a better perspective on their work when relatively free from personal pressures and prejudices

'For this purpose, banks of frozen reproductive cells such as we already have today will be maintained, and also multiplying cultures of them. This will make the most precious genetic heritage of all humanity available for nurturing into childhood and adulthood

The distinguished scientist added that there would be 'even more predictability concerning the nature of progeny to be desired by a kind of parthenogenesis where an offspring ordinarily have their hereditary material picked in a random way from two different parents—in this case the offspring obtains his hereditary equipment entirely from one individual with whom he is as genetically identical as if he were an [illegible] twin

'It will be accomplished by extracting the nucleus from a human egg and inserting in its place an entire nucleus obtained from a cell of some pre existing person chosen on the evidence of the life he or she led and his or her drive potentialities

Dr Muller warned his listeners that if one nation carried this out 'even a few decades before the rest of the world did so' it would soon be able to rise to a level of capability so much higher as to make it virtually invincible "The world cannot afford to have separate nations putting up their separate genetic sputniks,' he added

Dr John Weir associate professor of psychology at the California Institute of Technology, declared that man could "discover the causes and cures of sickness and pain of hate and destruction' and predicted that we shall see the earth's population doubled

"It may be possible to change the environment of the nervous system and thus eliminate disease and malfunction and produce an increased biological efficiency of nerve cells and of the cell network he explained 'We should then be able to change emotions, man's desires and thoughts by bio-chemical means, as we are now doing in a rather gross way with tranquillisers

'Mental disease emotional illness neurosis maladjustment psychological insecurity would be eliminated The intellectual output of the brain should be greatly increased

In Dr Weir's view, a century from now man would find living exciting pleasant and satisfactory with mental illness wiped out and with it neurosis, maladjustments psychopathy and criminology

'He will be physically, mentally and emotionally healthy he concluded

Dr Wernher Von Braun creator of Germany's V-2 rocket in World War II and now Director of the U.S Army's ballistic missiles agency at Huntsville Alabama said By 2057 A.D, the wonders of the cosmic age will have unfolded before the eyes of mankind

"Several expeditions will have already gone to Mars and Venus and exploratory voyages will have been extended as far as Jupiter and Saturn and the natural satellites

Voyages to the moon will have become common place The surface of the moon will have been sub-divided with spheres of interest by the scientists of the major Powers and a lot of prospecting, tunnelling and even a limited amount of actual mining operations of precious ores and minerals will have gone on

At some particularly scenic spot on the moon lavish excursion hotels would have been *established and operated by* several national space lines for the purpose of attracting more passenger traffic in addition to their main business of hauling commercial cargo All these places would be pressurised and air conditioned featuring large picture windows and astral domes to do justice to the magnificent scenery and run the whole gamut of honey moon hotels to wide open gambling joints

Travel *costs* would have been reduced by thermo-nuclear energy powered space ships, and definite plans would be under way for a regular transport system between the earth and the nearer planets There would be express voyages for passengers and slow, unmanned automatically guided freight hauls for bulk cargo Dr Braun added

There would be large manned space stations in service as space terminals and meteorological bureaus and each with its department of closely guarded national secrets From these stations military reconnaissance will be carried out with the aid of powerful telescopes which have been combined with advanced offsprings of today's aerial photo-reconnaissance cameras and also with colour television for immediate despatch to the ground From these all seeing eyes no military secret would be hidden

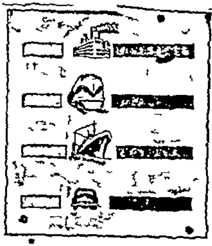
DID YOU KNOW ?



By Scio

Thick fleeces can *cause* livestock losses on Chilean sheep farms at the Strait of Magellan In rainy weather *the wool of sheep* becomes so wet and heavy that the animal which rolls on its back may be unable to regain its feet There it lies until rescue or death

The Soviets boast that 40 years of Communism *have* under mined the '*social roots of* religion and destroyed *the church* structure in the Soviet *Union The* Kremlin denounces *mothers* who try to instill *religious beliefs* in their *children* saying religious marriage *rites christening* and confession lower the dignity *of the* human being

The United Nations Year book reports that in 1955 the world's factories and mines produced about twice as much as in any prewar year The world's railroads hauled more than twice as much freight the world's ships carried about two-thirds more cargo and there were over twice as many motor vehicles on the world's *roads as in 1938.*

Thoughtful consideration is reasonable and often necessary, but worry is simply a harmful waste of energy

WORRY IS AN ALIBI

By LEE JACKSON

MAN it has been said is the only animal that does something—then turns right around and worries about whether or not he did it right.

Unfortunately there s a lot of truth in the statement We do seem to be a species of worriers We worry about the high cost of living we worry about our health we worry about working too hard and about not working hard enough.

Many of the things we worry about are important other things are trivial What we seem to fail to realise is that worry accomplishes absolutely nothing—and is usually harmful Grace realised this fact

"I d be a lot better off if I didn t spend so much time worrying, she said But how can you help it ? How can you keep from worrying about the many problems that confront you ? '

There is a way Learn it and you can open the doors to a new richer life filled with the contentment and satisfaction of mature living

There are in all, only two basic situations which can cause us to worry The first type are those over which we have a definite, but unrealised control

Grace, for instance worried about the high cost of living

I just cannot seem to make ends meet, she said ' Food prices are so high that I don t know how to cope with them '

On the surface there is little that Grace can do to stop the spiral of prices or to make her limited income buy more Beneath that surface however there is a way to put an end to Grace s worry

She Analysed Her Problem

Worry is the negative approach. Let s look at Grace s problem from the positive side

Instead of worrying Grace decided to see what she could do about the cost of living

By careful analysis of the problem she could figure ways to make her budget stretch. She could for instance, study menus and prepare tasty and nutritious casserole dinners that could replace the more expensive meals built around meat She could learn which vegetables are in season at a given time and build her meals around them She could shop around and find how she could save here and there on her food budget by visiting various shops and markets in her neighbourhood

There are other ways she could stretch her money, too She could save by buying her milk and bread at the shop rather than having them delivered at extra cost

Rather than spending her days pottering around the house—and nearly every woman has such days in every week—she could take a part time at home job addressing envelopes

This would add extra capital to her income !

Grace could solve her problem with scores of other pound stretching ways too if she would attack her problem positively and productively, rather than just sit around and worry about it.

There is another kind of problem falling into the category of "worries we can control", and that concerns decisions

Many of us hesitate to act in certain situations because we re not at all sure of the outcome of our actions

Ruth for instance was concerned about her health She worried because she was having frequent dizzy spells and backaches She had considered consulting her doctor for a check up but had procrastinated and as a result spent a considerable amount of time, simply worrying

Sounds foolish doesn t it ?

Yet how many of us do just that ?

The solution to Ruth s problems is so simple that it hardly need be stated. A single trip to her doctor s could end her worry would show her just what was wrong with her physically and suggest a cure And if something were seriously wrong—as Ruth feared—is it not better to learn this early, so it can be corrected ?

Procrastination, perhaps, lies at the roots of most of our worries We don't want to do something or we hesitate to do it simply because we fear its outcome

Thoughtful consideration is helpful, but when it becomes procrastination and leads to worry it s a different story

Medical journals tell us that worry can actually be harmful to us It places an extra strain on the heart and can cause irregularities in the intestines not to mention the feelings of fatigue and depression that are implicit in worry.

Worrying over things we can control is simply a harmful waste of energy Look at the problem that faces you Is there any thing you can do about it ?

If there is—face the problem It s that easy

Accept The Inevitable

Not quite so easy is the question of situations beyond our control That is the second general 'category about which we worry

You might say If I can t do anything about a problem, why should I worry about it? Why do you ?

For the same reason all of us do—we can not do anything else about the situation, so we worry about it

Frank, is a case in point

Ill health made it necessary for Frank to retire from his job as office manager for a small manufacturing firm He would have retired in a year or two anyway, but because of his health he was retired involuntarily

Frank felt that he was ' put to pasture as it were—that he was of no further use to anyone and that he had nothing to look for ward to

The logical thing for Frank to do of course is to pursue those activities he had never had time for in the busy past—to enjoy and make good use of his free time

But it s not always as easy as that for a man when he retires

Frank as you will guess worried about his health about the loss of his job and about the future

Here is a case in which there was absolutely nothing Frank could do to attack his problem He could not go back to work. He could not restore his top-notch physical condition

Fortunately, Frank was a sensible man. He had learned to think clearly, to accept responsibility during his working years

"There isn t a lot I can do about things , he told his wife. Being bothered certainly is not going to help much'

And he was right To worry over some thing we cannot control does nothing but make us feel bad—make us feel downright sorry for ourselves

Frank tackled his problem as best he could No he wasn t glad to retire He hated those afternoon naps that the doctor told him to take He didn t want to be babied and he didn't want to feel he was of no positive use

It was hard to do—but he accepted his situation and decided to make the best of it He didn't give up Not at all He simply, and again we repeat substituted positive action for worry He couldn t alter the situa tion but he could—and did—accept it and make the best of it Making the best of a bad situation paid surprising dividends

Today Frank is perfectly happy And his health is a lot better than it was too During the school season he is employed as a traffic warden You can see him regularly in the morning at lunch time and after school halting traffic and helping the school children across the street

He didn t necessarily need extra money—his savings and the pension he received looked after his financial needs—but the extra money helps and more important he is out there with the youngsters helping them He is loved He is doing something useful, and he is enjoying it

In his spare time at home Frank is busy in the basement with a power saw that he bought with the money he earned at the school He has found he has a real talent for making—of all things—modern bookcases and coffee tables

Again he is bringing in more money But again more important he is doing something he really wants to do

No fretting no worrying here Frank learned to live with the problem—and in his case in time it disappeared altogether

It may sound too easy—but it is easy to control your worries and to replace them with a happier life A happy life is inevitably a full life

Chances are there is something worrying you this very minute Stop and consider—is it something you can control ?

GROWING IMPORTANCE OF

INDIAN MILITARY COLLEGE

SET amidst the beautiful environments of the Doon Valley the Military College which imparts pre-commission training to Army officers completed 25 years of useful existence on December 10 1957

Originally known as the Indian Military Academy, the College was formally inaugurated by the then Commander in Chief of India Field Marshal Sir Philip Chetwode on December 10 1932. However the first batch of cadets had arrived at the institution two months before on October 10 while Brig L.P Collins, the first Commandant, had taken over earlier still

A considerable amount of spadework had to be done in preparing the syllabus and making other arrangements for the commencement of the first term course At the same time several alterations to the buildings acquired from the Indian Railways had to be undertaken

The training course at the Academy was originally designed to last three years but this was reduced to 2½ years later The first intake at the I.M A. comprised only 40 cadets Of these 15 were selected by a competitive examination and another 15 from the Army while ten came from the various Princely States

Words of Advice

While inaugurating the I M.A on December 10 1932 F M Sir Philip Chetwode referred to the courtesy of the Indian Railways in making the buildings of their Staff College available for accomodating the I M A He also said that site of the Academy in the Doon Valley was ideally suited for imparting training to Army cadets He impressed upon the pioneer cadets that they had come to the Academy to have first lessons in the following three principles which were to guide the officers of any army —

> "The safety honour and welfare of your country comes first, always and every time
>
> The honour welfare and comfort of the men you command come next
>
> Your own ease comfort and safety come last, always and every time"

These words of wisdom have been inscribed in gold lettering on the imposing oak panelling of the entrance staircase of the Chetwode Hall so as to be a constant reminder to the passing-out cadets about their future conduct and behaviour

The first batch of cadets to arrive at the Academy left on December 2, 1934 They did not have an easy time—they had been, as it were the subject of an experiment because their syllabus of instruction underwent constant variation They however acquitted themselves well and the coveted Sword of Honour at the passing-out parade of the course was won by Senior Under Officer Smith Dun who later became the first Commander in Chief of free Burma

The College witnessed large scale expansion from 1936 to 1939 when more buildings and playing fields were constructed By now the College had produced 350 commissioned officers The outbreak of World War II saw further reorganisation at the College and its strength rocketed to 1,100 necessitating the putting up of new buildings

In 1942-43 as a result of experience gained in the second World War, the training programme underwent a new order, the change of Commandants fresh from the Burma campaign largely contributing to its implementation Throughout the war years the I.M.A employed a carefully worked-out and a highly integrated scheme for compressing the duration of the course to meet urgent demands and produced nearly 4 500 officers in about 40 courses The authorities were however, careful to see that the standard of training at the Academy did not deteriorate Four courses were also run to train men for holding what was then known as the Viceroy's commission as Jamadars and Risaldars

The end of the war set the authorities thinking about reorganising the I.M.A. to meet the Army's peace time requirements. Meanwhile partition of India came necessitating complete reorientation Maj-Gen Thakur Mahadeo Singh (retired) then Brigadier was the first Indian to be appointed Commandant a position which was hitherto a close preserve of the British

Inter Services Training

Among the major lessons learnt during World War II was the value of inter Services co-operation While the post war reorganisa-

tion of the I M A was in hand soon after independence it was thought to be opportune time for introducing what was then a unique experiment in inter-Service training In 1949 the I M A was converted into an Armed Forces Academy with two wings—Inter Services Wing was to give combined preliminary training to cadets of all the three Services while the Military Wing was to provide advanced training for Army cadets before being commissioned

Side by side with its reorganisation a permanent site for the expanded institution was selected at Khadakavasla In 1954 the Armed Forces Academy since re named National Defence Academy moved to its new home at Khadakavasla where cadets of all the three Services undergo joint basic training for three years The Military Wing which remained at Dehra Dun was soon appropriately re-designated as Military College

Producing a large number of commissioned officers of high integrity for the Army the Military College occupies an important place in the defence structure of the country Fortunately it has had the benefit of the services of efficient Commandants among whom may be mentioned Gen K S Thimayya the present Chief of the Army Staff

Since it came into being the Military College has turned out a large number of Army officers many of whom have risen to the rank of Brigadier It will be interesting to know that Brig M.M Khanna MVC who is presently Commandant of the College was a cadet at the old I M A and was commissioned in July 1936

Sword of Honour

The Military College offers several awards which are presented at the conclusion of each half yearly term (June and December) to gentlemen cadets attaining distinction The proudest and happiest cadet at each passing out parade is he who is adjudged the best all rounder of his course and wins the coveted Sword of Honour

Cadets placed first and second in order of merit are awarded gold and silver medals respectively while the best cadet of the regular course receiving a commission in a technical arm gets the Pollock Medal named after Maj Gen George Pollock of the Corps of Royal Indian Engineers

Besides there are several other prizes for accomplishments in various subjects in the military, academic and physical education fields Moreover there are special prizes invariably given by the various corps concerned Infantry the backbone of the Army, found recognition a few years ago by the institution of a separate prize Similarly a special trophy is offered to the best cadet commissioned into the Service Corps

Gallantry Awards

Special attention is paid at the Military College to the development among cadets of those inner qualities of leadership which are regarded as essential acquisitions for an officer of the Armed Forces Every effort is made to inculcate in them discipline, courage determination and perseverence which enable the would be Army officers to win the confidence of the men they command whether in peace or in war and lead them through thick and thin by personal example of a high order

The value of training imparted at the College is borne out forcibly in the numerous gallantry awards earned by its alumni in different theatres in the last World War in actions fought in Jammu and Kashmir during the invasion of the State and in the operation against the hostiles in the Naga Hills Outstanding among such recipients of the awards are Brig Premindra Singh Bhagat Maj Som Nath Sharma and 2nd Lt Polur Muthuswami Raman.

First Indian and ex-cadet of the College to win the Victoria Cross during World War II, was 2nd Lt. (now Brig) P.S Bhagat of the Corps of Engineers

After the institution of Indian Military awards following Independence Maj S N Sharma of the Kumaon Regiment who died fighting in Kashmir was the first to win the Param Vir Chakra the highest decoration for the most conspicuous bravery

2/Lt P M Raman of the Sikh Light Infantry was posthumously awarded the Ashoka Chakra Class I for gallant action against hostiles in the Naga Hills

GENERAL EDUCATION AT UNIVERSITY LEVEL

By PROF P MAHESHWARI
(Head of the Botany Department Delhi University)

THE topic of 'general education is now receiving considerable attention in our universities My interest in the subject is only about five years old but it received considerable stimulus as the result of a visit last year to certain institutions in the U S A and the U.K sponsored by the Union Education Ministry Eight of us then joined to produce a report which has been printed and is now available

I do not propose to repeat what has been said in this report which was written about 18 months ago but to treat the subject in a fresh and slightly different way Naturally the opinions presented in this article are my own and do not in any way commit either my colleagues in the Education Ministry s team or in Delhi University

Not New

It may be said at the outset that the idea of general education is by no means new In fact it goes back to the time of Socrates and Plato The content of education then comprised classical languages religion rhetoric, mathematics and later the natural sciences Such education was however meant only for the so called 'gentlemen the privileged few in society The rest the labourers and servants received only vocational education The first aimed at mental development for its own sake, and the second to make it possible for the recipient to gain a livelihood

In Europe, after the 18th century the old distinction between the leisured and the working classes begin to vanish The so-called upper class now began to have decreased leisure while the working class began to have greater amenities of life The idea of a gentleman naturally came to be different from what it was before

Along with this social change there also came a vast expansion of knowledge itself Natural philosophy was replaced by physics chemistry botany zoology physiology etc. and each of these became further subdivided into smaller branches Similar ramifications took place in the humanities and social sciences

Specialization

At the same time the rapid industrialization which began in the 19th century gave birth to new occupations and the specialist became more and more essential, or let us say even indispensable, for economic prosperity In both universities and technical institutions many new departments were created and the teachers in these departments began to live in a rarified atmosphere of their own. The division of knowledge which was at first a matter of convenience now became a reality, and higher education lost the unity it had in earlier simpler times

While specialization is unavoidable in our present set up the question before us is whether we are not losing that core of common knowledge skills and attitudes and the sense of values which go to make a rounded personality Was it not Einstein who once said that through specialization the student could become a kind of useful machine but not a harmoniously developed human being ? According to him a narrow specialist was no better than a trained dog ! Specialized knowledge implies generalized ignorance

Granting that narrow specialization must be avoided, the next question is up to what level should we have general education and when should it be followed by specialization, also what should be the area covered by general education

Lifelong Process

A large number of our teachers and educators consider that the school is the proper place for general education which should stop at the matriculation or higher secondary level This might have been all right in the past when the majority of people lived a simple and rustic existence and there was only a small amount to learn Knowledge has now increased a great deal and there are limitations to the capacities of a youth of 16 or 17 He is too young to appreciate critically and to imbibe ideas about modern events and their implications in an intelligent manner

In the present set-up general education has to be a life long process and a student must be

made to pursue it up to a stage when the teacher feels reasonably certain that a student will continue it of his own accord even after his formal education has been completed Many are the windows to life Only a few of them can be opened to our students at the school stage some must be left over for the university stage and there will probably be a few more which they will have to open for themselves after they leave the university

Bachelor s Level

It seems reasonable to conclude that along with specialized work we should devote a fair amount of time even at the bachelor s level for studies of a more general nature This might be done for two years on a comqulsory basis and later at the post-graduate and doctoral levels on a voluntary basis

I wish to emphasize the word *compulsory* If milk is good we force a child to drink it even though he may like coffee or tea Similarly if it is agreed that there should be general education as a preliminary to specialization we must *require* our students to undergo such training and reinforce it with an examination rather than leave them to exercise their own choice in the matter

It is futile to talk of free will in the case of a child who is still a bundle of undisciplined impulses We must bring the student to a stage when he has acquired a certain mastery of impulse and emotion some experience of the good and some disposition to care for and aspire to it Does an undergraduate student have all this ? We know only too well that he does not at least in this country If he did he would not join a group of rowdies parading in the streets with banners with a view to burning the effigy of their vice chancellor and shouting slogans against the chancellor

Area Of Education

Coming next to the *area* of general education it appears appropriate to include the following under it

1 The physical structure of the world in which a human being lives

2. What sort of an organism man is what are his associations with other living organisms and what are conditions of his survival ?

3 What are the principal achievements of man in literature music and art ? (A course like this may well be designated as Development of Modern Civilization)

As a matter of curiosity I have often in [illegible]

they knew of such epics as the *Ramayana* and the *Mahabharata* and of Kalidasa s masterpiece *Shakuntala* While most of them had a fair knowledge of the narrative part few showed any appreciation of the beauty of these works Many never read any newspapers either due to lack of time or an indifference to what was going on around them Even more disappointing was the attitude of intolerance which some had developed towards any activity other than their own specialized field Their attitude seemed to be What I know not is not knowledge What I am not interested in is not interesting Such persons although competent in their own special branch of knowledge, would obviously be no good as teachers of general education For this purpose we must have men who are not only eminent in their own fields but also are keen to receive light from other fields and shed light from their own upon the basic problems of others

An Example

However it is not necessary or even desirable that we should have groups of teachers appointed solely to teach general education The staff for this should be drawn from the different departments of a university and its members will continue to have their major work in their own specialities plus some work in the department of general education To give an example supposing that four teachers in a particular department are men with a sufficiently broad background and offer to take part in a programme of general education each of them can be assigned a couple of

---

(*Continued from page 103*)

If so face the problem squarely—if it is a decision you are worrying about—make it If it is something you are putting off—do not put it off any longer Do it and the worry will be gone

On the other hand if you are worried about something that you can not control, directly or indirectly decide how you can best live with it Take your time think it through—but *think* positively Think in terms of pluses—not minuses

Remember that everybody has problems The really mature well adjusted person faces hose problems—does not simply worry about them

Remember too that as depressing as harmful as distasteful as worrying might be—it is really a lazy habit.

You can stop worrying if you really want [illegible]

periods of this work. In order to give them corresponding relief in their regular teaching the university could appoint an additional lecturer or research assistant in the department concerned. All the teachers drawn from different departments can elect a chairman and meet once a month to discuss common problems so that their efforts produce a united and coherent effect. Sometimes there can also be inter-university meetings of selected teachers to enable them to profit from each other's experiences.

Groundless Fears

It may be presumed that the Government or the University Grants Commission would provide the necessary finance for the appointment of additional staff so that the lectures may be followed by discussions with small batches of students. A more serious problem taxing the minds of our educators is how to squeeze in a new programme of general education when the time at our disposal is already short. Is there not a danger that the loss may outweigh the gain and our education may get so diluted that it will be ineffective? In other words it may become a little bit of everything and not enough of anything and the students produced by this method may learn to talk without having much to say. Such fears I think are groundless.

I have no hesitation in saying that a fair part of the specialized education of our youth could very well be exchanged in favour of a richer general background. Standards are not determined by what is taught but by what the student can grasp and think about. Selection is in fact the essence of teaching and there is much dead weight in our courses which could be pruned away without any disadvantage. Under present conditions no one really becomes a master of his subject at the M.A. or M.Sc. stage. One tries to be come so at the Ph. D stage but it will be many more years of toil and hard work before he will be accepted by the world as a specialist.

If a student is good he will have plenty of opportunity for greater and greater specialization during the years following the Master's degree. If he is indifferent it is just as well that he had at least some general education.

Two Years

There is another point to be kept in mind. General education is not something to be got rid of as quickly as possible, but a means to enable our sons and daughters to live a richer and nobler life. The ideals of truth goodness and beauty and a sense of values which now have such a hollow ring in our universities must be brought back before it is too late. We can only hope that two years of compulsory general education suggested here, will kindle a desire in most youths for many years of voluntary reading without the dread of any examination conducted by a university agency.

There is one question which arises in the minds of many persons. Why is it that while almost everyone approves the idea of general education in theory hardly any university has done very much to implement it? The reason I think is that teachers are not adventurers. We find peace and prosperity in established routine in easy conformity with the past. We look down upon new fangled ideas and do not want to go out of the line. We tend to teach as we were taught to use old and tried tools, techniques and methods. Progress will therefore, be slow but it will come all the same.

(The Hindustan Times)

HOUSING IN INDIA—3

A sum of Rs. 20 crores has been earmarked during the Second Plan for slum clearance to provide 1,10,000 developed plots or tenements.

Of this amount Rs. 15 crores is to be given by the Union Government as their share of loan and subsidy and the State Governments have to find the remaining Rs. 5 crores as subsidy from their own resources.

Out of the Union Government's share Rs. 11.14 crores have already been allotted to the States and the remaining amount is available for allocation.

63,452 houses were built and Rs. 25.31 crores sanctioned up to August last year under the Subsidised Industrial Housing Scheme.

Under the Low Income Group Housing Scheme the number of houses built up to the end of August last year was 13,512 while 13,168 units were under construction.

A sum of Rs. 18.41 crores has been disbursed so far to the State Governments under this scheme.

The Plantation Labour Housing Scheme was introduced in April 1956. The provision in the Second Five Year Plan under this scheme is Rs. 2 crores.

NATIONAL CADET CORPS MOVEMENT

By Brig D PREM CHAND, Former Director of N C C

THE aim of this article is to give a background of the National Cadet Corps movement together with its aims and objects in the hope that it will help to some extent in clarifying the implications and potentialities of this great youth organisation

Since the advent of Independence there has been a great public demand that military training should be given to the youth of the country both in the interest of the nation s defence and for moulding the character of our young men and women along the right lines Our leaders were fully alive to this public desire and a committee under the chairmanship of Pandit H N Kunzru known as the N C C Committee was constituted in July 1946 to make recommendations for the establishment on a national basis of a cadet corps organisation in schools colleges and universities After carefully analysing the needs of the youth of the country the Committee submitted its report to the Government of India in March 1947 Early in 1948 Government decided to implement the recommendations of the Committee the National Cadet Corps Act being passed by Parliament a little latter the same year

Disciplined Citizenship

More than nine years have elapsed since the inception of the N C C and during this period not only has there been steady expansion of the Cadet Corps but marked increase in popular enthusiasm for it Expansion of the N C C as a means of developing disciplined citizenship amongst the youth of the nation has been kept in mind by those responsibe for framing the first and second Five Year Plans Although financial considerations have to some extent been a limiting factor the majority of States are making every effort towards the ultimate aim of having a Cadet Corps unit in every college and high school in the country

The aims to be achieved by the N C C are firstly to develop character comradeship the ideal of service and capacity for leadership in young men and women secondly to provide Service training to young men and women so as to stimulate interest among them in the defence of the country and thirdly to build up a reserve of potential officers to enable the Armed Forces to expand rapidly in a national emergency

Of these aims the second and third are automatically achieved by cadets being trained by officers and NCOs of the Armed Forces It is the first aim, that of building up your young men and women into an army of disciplined citizens which requires the maximum amount of emphasis at all time

Aims Of Three Divisions

The N C C consists of three divisions the Junior Division formed from amongst students of schools the Senior Division enrolled from regular students of colleges and universities aud the Girls Division enrolled from among girl students of schools and colleges

The primary object of the Junior Division is educational and the organisation is designed to build up the character and physique of cadets to infuse in them a sense of discipline and to stimulate their interest in the defence of the country Junior Division units are raised in high schools including public schools Boys and girls to be enrolled as cadets must be of a prescribed age so that they may derive the maximum benefit from the training which is given to them It is hoped that the Junior Division will be able to supply all cadets for the Senior Division and thus ensure continuity of training for a period of five to six years To enable this to be done Army Navy and Air Force units have been raised in the Junior Division corresponding to similar units of the Senior Division

The aim of the Senior Division is to provide training in discipline and leadership qualities which are likely to be assets for cadets in all walks of life and to help in building up a potential reserve of officers for the three Defence Services As academic studies are of primary importance to students of universities and colleges Service training is carried out in such a way as not to interfere with academic work. The maximum tenure of service for a cadet in the Senior Division is four years which corresponds to the period a student normally spends in a university

Army Naval and Air Wings

The Junior and Senior Divisions are composed of three wings—Army Naval and Air The Army Wing has units of the Armoured

Corps Artillery Engineers Signals Infantry, Electrical and *Mechanical Engineers* and the Medical Corps In addition to the normal basic training cadets interested in technical subjects join the *technical units* where they receive specialised training Units of the Naval Wing are of necessity raised in places where *facilities for naval training are easily* available In units of the Air Wing theoretical and practical flying and gliding training are imparted and with *the help of flying clubs* cadets obtain A Flying Licences at Government expense

Cadets of the Army Wing of the Senior Division are given training among other things in citizenship public speaking platoon and *section leading Infantry armoured* and artillery units of the Army Wing are raised in non technical colleges and engineers signals *and electrical and mechanical units are constituted* in technical institutions

The principal aim of the Naval Wing is to make the youth of the country naval minded. Cadets are given training in basic naval subjects and technical subjects and they get *an opportunity* of going *out into the sea* on ships of the Navy once a year

The Air Wing aims at making the youth of the country airminded and trains cadets interested in aviation In addition to drill a cadet is taught principles of flight airmanship, navigation, aero-engines and metereology Aero-modelling is taught to make cadets interested in an extremely fascinating pastime Air Wing cadets with *two years training to* their credit get opportunities of glider training and flying if they complete their glider *course successfully*

In order to give special encouragement to suitable qualified cadets desirous of joining the Armed *Forces in the commissioned ranks* Government has drawn up special schemes which enable them to secure direct entry into *the Military* Naval and Air Force Colleges Ten per cent of the vacancies are reserved for N C C cadets who are not required to take the U P S C. examination

The object of the Girls Division is to develop the personality of girls to make them *self reliant* to build up their physique and to enable them in a national emergency to take up some of the duties normally carried out by men Response for enrolment in this division is most encouraging The initial [illegible]s to put on uniform has been overcome [illegible] the enrolment of girl cadets has had a [illegible] upward trend in recent years Wo- [illegible] to command [illegible]

colleges and schools, enrolled from amongst professors and teachers of educational institutions, are also coming up in larger numbers for pre commission training It can safely be asserted that this division is already giving a very good account of itself

Social Work Service

The N C C among other duties undertakes social service work of various kinds In fact social service has now become an integral part of the training of cadets through conducting camps in all the States during the vacation period In order to instil the dignity of manual labour in the future citizens of India cadets are given opportunities to build roads bunds irrigation channels huts for low income groups and playgrounds in different parts of the country They have also undertaken soil conservation and afforestation work in several areas Girl cadets have undertaken tasks of teaching villagers hygiene and *sanitation and clean living habits* Cadets have also lent a helping hand in flood relief work

It should be emphasised however that the value of social service camps has to be judged not only by the actual output of work done but also by the lasting effect of such work on the life of cadets in general Their achievements though limited and sometimes of a temporary character (*unless follow up action* is initiated) are well worth the while in respect of the time and money spent for the *purpose A vital effect now quite* apparent *is the genuine desire* on the part of the youth to help in the execution of national projects All that they want is leadership to bring out the best in them and this leadership is provided by the N C.C.

Inculcating Discipline

A survey of the reactions of cadets to N C C training undertaken by the Army Statistical Organisation recently reveals interesting findings A comprehensive questionnaire to 5,386 cadets of the Senior Division was sent by *the Organisation and the* analysis of their replies has yielded valuable data about the youth in India

In the opinion of cadets the most *important* benefit of N C C training that they have derived *has been the* inculcation of discipline which coming *from them is a most* heartening sign of realisation of their responsibilities to the nation Other benefits from the training listed by cadets in order of importance are [illegible] develop-

ment of personality team spirit, building of character, qualities of leadership use of wea pons and good citizenship

The suggestions offered on their own by cadets are interesting To mention a few, they felt that they be given opportunities of visiting operational areas that there should be more provision for military training and that selection for N C C training should be by competition

While the data disclosed by the statistical survey analysis of the reactions of cadets is interesting I have during my inspections of cadets parades and training camps found that a very large number of cadets are extremely keen conscientious and most enthusiastic about their work in the N C C., which has been one of the most heartening and encourag ing aspects of the training imparted in the Cadet Corps

An atmosphere of hope faith and optimism hovers over all the activities of the Cadet Corps today The nationwide interest in the Corps is now so marked that its future as a permanent part of the youth movement in the country is assured The growth of the organi sation has been properly planned to ensure balanced development in all its aspects

Important Milestones

1946 Formation of the N C C. Committee

1948 Decision of the Government of India to implement the Cadet Corps scheme

Passage of the N.C C Act by Parlia ment

Inauguration of the Cadet Corps

1949 First Pre-commission training for officer cadets of the Senior Wing of the Girls Division at the Delhi Can tonment

1950 Publication of the N C C Journal 'The Cadet

Addition of an Air Wing to the Corps Bombay takes the lead by forming No 1 Air Squadron

1951 Organisation of the first NCC course at the Military College Dehra Dun, for direct commission in the Army

Visit of NCC cadets to the U K

1952 Participation by a Cadet Corps con tingent in the Republic Day Parade

Raising of the first unit of the Naval Wing of the Senior Division

First pre-commission training course for officers of the Naval Wings of the Senior and Junior Divisions

1953 Introduction of Combined Cadre and Social Service Camps

Formation of the Auxiliary Cadet Corps as supplementary to the N C.C

1954 Flying training of the first batch of Air Wing cadets for direct commis-sion in the Air Force

First pre commission training for officer cadets of the Junior Wing of the Girls Division

Raising of the Junior Wing of the Girls Division

Introduction of rifle shooting for cadets of the Girls Division

Introduction of Labour and Social Service Camps in the A C C

1955 Introduction of gliding in the Air Wing

1956 Raising of the first naval medical unit of the N C C

Introduction of ship-modelling in the Naval Wings of the Senior and Junior Division

First combined annual camp of Naval Wing units of the Senior Division

Introduction of the revised A C C. syllabus

1957 N C.C Training Centre at Kamptee inaugurated Cadets from Common-wealth countries—the U K, Austra lia and Ceylon—visit the Cadet Corps Rally

Fifth combined annual camp of the Air Wing held at Jodhpur

Gliding introduced at Madras Patna and Jaipur

Second annual combined camp of the Naval Wing held at Vishakhapatnam. Naval cadets participate in the sum-mer cruise of the Navy

Central Institute of Education

THE Central Institute of Education completed 10 years of its fruitful existence on December 19 1957

Set up as an all India institution by the Government of India in 1947 the Institute is administered by the Central Ministry of Education & Scientific Research and is a constituent college of the University of Delhi

It has two main functions (i) to conduct researches in education the findings of which should be useful to the country as a whole and (ii) to offer courses, particularly of an advanced nature to teachers and other educational personnel

With the attainment of Independence in 1947 India had to face many problems in the field of education On the one hand the problem was to provide educational facilities for millions of children while on the other the improvement in the quality standard and the content of education was no less important

Ever since its inception the institute has been trying to fulfil the latter objective It has expanded in different directions in fulfilment of its aims It began as teachers training college offering only the course for the Bachelor of Teaching (later changed to Bachelor of Education) Degree Gradually, however it has introduced other courses and increased its activities as well as its utility

The activities of the Institute as it is today may be classified under two broad heads (i) teaching and (ii) research On the teaching side it now provides three courses leading to the B Ed, M Ed. and Ph D Degrees of the University of Delhi On the research side the Institute has a special division for research work It also has a well-equipped psychological laboratory Also attached to the Institute are an experimental nursery department and an experimental basic school

The Nursery Department besides making experiments with the techniques of nursery education acts as a living laboratory for psychological studies of various kinds Out of it has developed the Child Guidance Centre

The Nursery School has 30 children on its rolls of the age group 2½ to 5 years A special feature of the school is that the students are spared the rigours of formal teaching of three R s Emphasis is laid on learning through experience and activity both individual and group Importance is attached to special activities such as story telling by the children, miming expression through movement or eurhythmics modelling and painting and musical games

The B Ed students who have offered *Early Childhood Education* as an optional subject are making good use of the Nursery School for their observation of child development

Novel Feature

Another novel feature of the School is that is has made the mothers of these children interested in the new experiment By turns they visit the Nursery School once or twice a week to assist the management in conducting some of the activities in which they are interested. For this purpose they are encouraged to read books from the library on child development

To study the development at the nursery stage teachers in the school are collecting the vocabulary used by a group of children in their conversation They are also observing another group of non Hindi speaking children to study how they are picking up Hindi from their companions

Basic School

The Institute s Basic School is an experiment in the urbanization of Basic Education. The seventh class has been added to the School from this year For the first time an experiment in the teaching of English through the new structure method is being carried out in the two senior classes of the School Experiment is also being carried on in the teaching of General Sciences based on the physical environment of the children and on the current development in the field of science

The Research Division of the Institute is engaged in a number of research activities The Psychology Wing has made good progress during the last year The first report on the individual scale of intelligence has recently been published

There is a well-equipped psychology laboratory attached to the Institute During the past few years the Institute has been working on an individual scale of Intelligence in Hindi a verbal group test of intelligence and an adaptation of a non verbal test of intelligence The members of the Institute are engaged in

preparing a number of other types of tests such as aptitude and attainment tests

The Child Guidance Centre, which is a part of the Psychology Wing of the Institute has made considerable progress since it started functioning on a regular footing in November 1956 A number of Delhi School Principals who are co operating with the Extension Services Department of the Institute have shown interest in the centre by sending their problem children to it

Extension Services Department

The Extension Services Department of the Institute is engaged in multifarious programmes of activities for in service training of Delhi teachers It runs summer camps, organises short and long term courses seminars workshops etc for the teaching profession The Department has also brought out a number of publications on subjects which are of great interest to teachers

Community Life

The Institute is trying to build up a community life of its own in various ways For all community activities it is divided into three houses and most of its activities are organised housewise.

Apart from book learning there is special emphasis on the co-curricular activities for fostering creative self expression in the students There is provision for such activities in the daily time table while there is sufficient variety to suit all tastes and inclinations The students take an active part in organising and executing the various programmes which include debates panel discussions symposia excursions games, athletics and cultural programmes etc etc.

The Institute possesses a good library stocked with books mainly on education and a large number of journals The number of books in the library is over 15 000 at present

This year the Institute has attracted students from Philippines Burma Fiji and Nyasaland to give it an international character

The Central Institute of education is still an infant institution but during this short period attempts have been made to make it a centre of training and research which will give a new orientation to our educational method and techniques The whole subject of education training is a dynamic one and there is constant need for experiment adjustment and reform.

The Institute is making an earnest effort not only to evolve a better type of training for teachers but also to serve as a kind of educational laboratory where different educatianal problems are to be studied and research workers trained in the field of education

---

T B AND B C G VACCINE

Tuberculosis as a disease existed as early as 2 500 years ago but the causative organism—Tubercle Bacilus—was discovered towards the close of the 19th century

In 1921 the B C G (Bacilli Calmette Guerin) vaccine was used for the first time in France on a child of a tuberculous mother By 1939 the practice to protect children through B C G spread all over Europe Indo-China China and Chile

The total number of persons who are B C G vaccinated all over the world now exceeds 180 000 000

Tuberculosis research experts after valuable experience gained during the last 20 years have certified that the vaccine is harmless and effective The Expert Committee of the World Health Organisation strongly recommended the use of B C G on an extensive scale in countries where tuberculous infection and mortality are high

In India one person dies of tuberculosis every minute and one in every 150 suffers from it It causes an annual estimated loss of about Rs 200 crores and of 90 to 100 crore man-days.

The Government of India introduced the B C.G Vaccination Programme in 1948 on a small scale In 1951 the Programme was converted into a mass scale national campaign

In India today 154 B C G Teams are now operating Until September 30 1957 nearly 96 4 million people were tuberculin tested and nearly 33 8 million B C G vaccinated This campaign is the largest single immunisation programme attempted by any country in the world

THE HILL TRIBES OF ASSAM

By CABRIELLE BERTRAND

SANDWICHED between East Pakistan Tibet and Burma Assam is the easter most state of India It includes the broad valley of the Brahmputra bounded to the north by the foothills of the Himalayas and to the south and south-east by hills named from their peoples—the Garo, Khasi and Naga Hills the highest point of which is Shillong peak. Much of this area is covered with jungles inhabited by a hotchpotch of wild hill tribes related for the most part to the Tibeto-Burman ethnic group

The different tribal areas are approximately known But it is difficult to take a census of the people living in dense jungles cut off from the outside world with independent political status since they are governed accord ing to their own tribal laws

Recently the Government of India set up a new agency in Shillong capital of the state of Assam to administer the tribal areas The North East Frontier Agency —its official title—is charged not only with the task of organizing the tribes but also of exploring the little known area between the Brahmaputra and the frontiers of Tibet

The task of the new agency will not be easy During the past few years several Indian geographical and ethnographical expe ditions to these parts were wiped out by the Abors a fierce primitive tribe living in the foothills along the North-east frontier

As far as is known the different tribal areas are as follows to the South West between the valley of the Brahmaputra and the Garo Hills live the Atchiks (or Garos) a tribe of head hunters Further to the East are the Khasi one of the world s oldest peoples who worship a snake god and have never moved from their original habitat the desolate Khasi Hills A mystery still surrounds this primi tive people they are of Mongol stock yet they speak an Austro Asiatic tongue related to the same linguistic group as the Munda language spoken in the North East of the Deccan and to the languages of the Moi people of Indo-China

In Eastern Assam the Naga Hills on the border of Burma are inhabited by a people of the same name who formerly practised head-hunting Their group includes several tribes They inhabit a vast area of hills and forests stretching from the mountains populated by the Mikir—a tribe related to the Garo but much more peaceful—well over the border into Burma

In the North of Assam the mountain coun-try of the Himalayan foothills is peopled from East to West by a mosaic of tribes the Mishmis the fierce Abors the Apa Tani the Miris Daflas Akas and others perhaps, whose names are still unknown

In earliest times Negrito tribes inhabited the Brahmaputra valley Later came Austro-Asiatic peoples who left their mark on the Khasi language

Then nomadic Mongoloid tribes descended in successive waves from the wide valley of the Yangtze Kiang the Me Kong and the Salween others came from the lake dwellings north of the Tsangpo valley in Tibet leaving a strong imprint in the Brahmaputra valley before moving on to the surrounding moun tainous jungle country There they stayed and their culture has scarcely evolved since that far-off period The Bodo of Assam, who belong to the Tibeto-Burma linguistic group are descended from this latter group of Mango-loid tribes

It was not until many centuries later that the Aryans conquered the valley where their civilization subsequently developed But the physical and cultural impact of successive waves of peoples has left its mark on the country contributing to create the stranger culture of Assam about which little is known since the earliest written texts available date back only to the 14th century

The great Indian epic Mahabharta has this to say about the tribes of Assam

> These golden-skinned peoples from the other side of the Himalayas and the mountains to the East—the mountains of the Rising Sun in the Karusa near the sea and on the banks of the Lauhitya these Kiratas who feed on fruit and wild roots who are clad in animals skins are proud of their weapons and cruel in their deeds I saw them O Lord! And their loads of sandalwood, of black pepper of precious stones, gold and silver and aromatic herbs

Up to the end of the 19th century Assam remained a closed country Scarcely any information filtered across its borders to the outside world with the result that it is difficult to unravel historical fact from legend The only records are chronicles written in Arabic between the 12th and 14th centuries which describe raids made by Mussulman horsemen to the valley of the Brahmaputra Mounted on powerful horses they invaded the valley in the middle of the monsoon season with the result that they were completely bogged down and perished without even once being able to pitch their tents

It was only when the British penetrated the area at the beginning of this century and a few monographs were published by officers in the Indian Army that the veil was partially lifted on this strange fierce yet beautiful land

An exhaustive study still remains to be made for the North East frontier district—always a difficult area—is still largely unexplored due to the presence of the wild tribes

These peoples live mostly from hunting in the jungle and fishing in the streams and rivers in which the country abounds Their agriculture is extremely primitive since they practise burn beating setting fire to the jungle and sowing their seeds in the warm ash The first year's crop is rice and as the earth is very fertile they reap an excellent harvest The following year they harvest cotton which they spin and weave for domestic uses In the cotton fields they also sow pimento and pumpkin seeds and the dried fruits provide calabashes for household use

This simple sort of agriculture however is scarcely sufficient to feed the tribes and the burn beating method has many disadvantages it destroys the forests and as new patches are continually being burned up the tribes are almost continuously on the move With this semi nomadic life no permanent administration is possible And in the tribal areas natural catastrophes occur almost every year in the rainy season the soil is swept into the gullies by the rain and land slides occur over large areas

One of the main tasks of the Indian authorities will be to introduce new agricultural methods by establishing permanent rice fields Later other crops such as Indian corn manioc millet and sesame will be grown helping to increase the capital assets of both the individual farmer and the community This in turn will lead to other developments villages will be set up as permanent settlements new means of communication will be opened up trade links will be established new markes created providing openings for farmers and craftsmen The nomadic tribes have nothing to lose from such developments which offer the promise of an easier and more secure life

—o—

EDUCATIONAL BROADCASTING IN INDIA

After the establishment (in 1930) of All India Radio as a State venture the Calcutta Station put out its first school broadcast in November 1932

By October 1938, four important Stations of A I R (Delhi Bombay Madras and Calcutta) started putting out regular broadcasts to schools

At present educational programmes for schools are being broadcast from 20 Stations of A I R Of these 13 Stations originate while seven relay programmes put out by the Zonal Stations

A Programme Exchange Unit at headquarters facilitates the exchange of worthwhile programmes put out by different stations

The number of schools with radio receivers has continued to rise steadily and at the end of August 1957 there were 9 124 schools equipped with listening facilities

The general policy of All India Radio is based on the principle that educational broadcasts should not attempt to replace the teacher but should help to supplement his work.

All educational broadcasts are planned in close consultation with Advisory Committees consisting of State educational authorities and prominent educationists including headmasters of listening schools

To enlist the interest of teachers in school broadcasts short in service courses for secondary school teachers in the installation manipulation and maintenance of radio recieving sets and the utilisation of school broadcasts are organised by A I R. Five such courses have been held so far

HUMAN RIGHTS

By PREM KIRPAL

December 10 1957 marked the Ninth Anniversary of Universal Declaration of Human Rights The day is of special significance to India for much of the respect for Human Rights in our country today is due to the teachings of Ashoka and in recent times Gandhiji The present article in brief, explains the content and significance of the Declaration of Human Rights

THE idea of Human Rights has lived long as a dream of humanity Down the course of centuries saints and poets philosophers and statesmen breaking away from the limitations of their narrow social environments often felt and expressed the oneness of humanity in their thoughts and ideals While living within the strict bounds of Tribal law and custom and caged in narrow parochial beliefs the visionaries of all societies dreamt of humanity as one great family whose freedom dignity and worth needed to be recognised and protected by certain inalienable rights It was more than 2500 years ago that the great Chinese Sage Confucius predicted

When the Great Way prevails all under heaven will become a Great Commonwealth

This belief in a united mankind was reiterated by several others In our own country the great Emperor Ashoka inscribed noble thoughts on rock and pillar to proclaim his vision of human rights In the West these ideals found practical application in such famous constitutional documents as the Magna Carta and the American Bill of Rights

With the signing of the United Nations Charter in 1945 for the first time in human history Human Rights became a matter of immediate practical concern to national governments as well as international organizations In Article 55 of the Charter of the United Nations the new World Organization was called upon to promote universal respect for and observance of human rights and fundamental freedoms The Charter did not define rights to be promoted

It was left to a United Nations Commission headed by Mrs Franklin D Roosevelt to elaborate this resolve into a Universal Declaration of Human Rights which was adopted on December 10 1948 by the United Nations General Assembly meeting at the Plais Chaillot at Paris The Declaration was a statement of principles and was not legally binding on member states It was to be followed by the formulation of an International Bill or Covenant of Human Rights

Special Significance

The content of the Human Rights listed in the Universal Declaration is significant There are thirty Articles covering civil political economic social and cultural rights Articles 1 and 2 state in very general terms that ' all human beings are born free and equal in dignity and rights and are entitled ' to all rights and freedoms set forth in this Declaration without distinction of any kind such as race, sex language or religion political or other opinion national or social origin property, birth or other status

These general rights are followed by eighteen Articles embodying civil and political rights such as the right to life liberty and security of person freedom from arbitrary arrest detention or exile freedom from arbitrary interference with privacy family home or correspondence freedom of movement the right of asylum the right to a nationality rights relating to marriage the right to own property freedom of thought conscience and religion freedom of opinion and expression the right of association and of assembly the right to take part in government and the right of equal access to public service

The social and cultural rights defined in Articles 22 to 27 pertain to social security right to work right to rest and leisure right to a standard of living adequate for health and well being the right to education and the right to participate in the cultural life of the community Article 28 recognises that everyone is entitled to a social and international order in which these rights and freedoms may be fully realised The concluding Articles stress the duties and responsibilities which the individual owes to the community This in brief is the content of the Declaration of Human Rights

Common Standard of Achievement

The General Assembly of the United Nations described the Universal Declaration

of Human Rights 'as a common standard of achievement for all peoples and all nations to the end that every individual and every organ of society keeping this Declaration constantly in mind shall strive by teaching and education to promote respect for these rights and freedoms The Assembly specially recommended that the governments of member states use every means available to distribute and publicize the text of the Declaration and to have it explained in schools and other educational institutions

This common standard of achievement for all peoples is being promoted not only by the United Nations and its Specialised Agencies but by national governments and all the forces of culture and civilization which mould the life of man today

Unesco s Role

Among all the organs of the United Nations UNESCO has to play a role of overriding importance in the promotion of Human Rights Clause 2 of Article 26 says ' Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedom It shall promote understanding tolerance and friendship among all nations racial or religious groups and shall further the activities of the United Nations for the maintenance of peace

Again Clause 1 of Article 27 proclaims ' Everyone has the right freely to participate in the cultural life of the community to enjoy the arts and to share in scientific advancement and its benefits It is this type of education which can promote understanding tolerance and friendship among all peoples and that broad and living culture which is not the monopoly of the few but the cherished right of all that are the best means of spreading ideals enshrined in Human Rights and of guaranteeing their enforcement among all peoples of the world

The signs of the times are indeed hopeful inspite of the deadly grip of an ideological conflict which continues to divide humanity Already in the forum of the United Nations the conscience of mankind can and does assert itself whenever there is a flagrant violation of human right At such moments even the influence of Great Powers wanes under the pressure of public opinion This is the most heartening achievement of the United Nations and the strongest support of Human Rights

In many ways India has contributed substantially to the development of Human Rights The representatives of India in the United Nations and its Specialized Agencies have often been the foremost champions of Human Rights The Constitution of India with its emphasis on justice tolerance and equality which are the very basis of democracy provides for the enforcement of almost all the Human Rights at the national level The secular character of the State does not prevent the shaping of policies and measures deriving their inspiration from the spirit of true religion

Teachings Of Mahatma Gandhi

Much of the respect for Human Rights in our country today is of course due to the teachings of Mahatma Gandhi In a letter written in May 1947 to the Director General of UNESCO the Mahatma touched upon the very basis of Human Rights which is also the ultimate condition of their successful enforcement

He wrote ' I learnt from my illiterate but wise mother that all rights to be deserved and preserved came from duty well done Thus the very right to live accrues to us only when we do the duty of citizenship of the world From this one fundamental statement perhaps it is easy enough to define the duties of Man and Woman and correlate every right to some corresponding duty to be first performed Every other right can be shown to be a usurpation hardly worth fighting for ****

It was on December 10 1948 the General Assembly of the United Nations at their meeting held in Paris adopted and proclaimed the historic Universal Declaration of Human Rights The Declaration had been in the making for three years

Word for word it had been fashioned by representatives from many countries so that it could be accepted as an agreed set of standards and goals by peoples of various nationalities and cultures Its formal adoption therefore marked a historic event in man s collective efforts to achieve freedom and security

To commemorate this occasion the U N General Assembly in 1950 asked the Member States to observe December 10 as Human Rights Day every year

Since its universal acceptance the Declaration of Human Rights has exerted a tremendous influence on human affairs It is an integral part of the United Nations programme for peace It has been invoked in the Councils of the United Nations in reaching decisions affecting the lives of people all the world over

---

WHO WANTS TO MEMORIZE?

By ANN ESS MORROW

THE question is asked, and the answers fly A few I do s, suggestive of the marraige ceremony are lost in the dissenting chorus Surely an alert teacher recognises the chal lenge here—to keep the affirmatives happy in their choice, to win the negatives over In his mind he begins to organise a Drop-the Adverb Campaign aimed at the I don t -ers to lure them into I do ways of thought

Skillful Guidance Needed

In many classrooms today memorisation becomes a real chore yet its possibilities are great It can be a process of pleasant remem bering or distasteful memory work Success depends upon the skillful guidance of the teacher for individual differences so stressed by modern education are uppermost here The wise teacher knows that there can be both delight and danger as he approaches the problem Too little or too much—either is de plorable Thus his observations and his judge ment must be keen

Learning Hindered By Reluctance

Experience would indicate that memory work done unwillingly carries little benefit to the student He learns the words reluctant ly and has no desire to interpret when he is not adequately stirred

Obvious blocks and negative attitudes sometimes result from such terse unmotivated assignments as 'Memorise twenty five lines of poetry for tomorrow—and know them perfectly Boys and grils look with hostile eyes at teachers who say this Mary and Tom and Alice didn t like the poem in the first place Peter and Jane didn t understand Thus classroom unhappiness grows like Jack s Beanstalk

If then the child has been left untouched aesthetically at the reading of the poem the necessity to carve within his memory a picture of symbols meaning less to him plunges him into deeper dislike for that which is difficult and thereby strengthens unfavourable atti tudes Promptly he rebels seeing the futility of memorising that which he does not yet comprehend

Problem Created By Teacher—Chosen Passages

This it seems has served as a block—demand memorisation—a giving back in un feeling fashion to the teacher those lines of poetry which he with the class book enjoys If lines are to be committed to memory—and the act does hold definite values for only in the original words is there a polished patterning of sound—would it not be advantageous to have the boys and girls choose those with adolscent significance?

Quantity An Important Factor

Tim Jones memorises gladly His teacher never makes demands too great for him. Or if the lines by chance are more than several, Mr White does not insist that boys and girls repeat the lines alone Together, as they say the words they gain feelings of security of oneness with the group, and satisfaction comes in chiming in as words become familiar

The teacher Tim had last year though expected far too much At such times. Tim gave up—he wouldn t even try because he knew he never could complete the assignment, nor could any other person in the room except Marie Marie could do anything academic but she couldn t bait a hook and spiders made her cry—a thought that somehow gave Tim strength Yet there was not enough to help him transfer words from page to memory

Thus it sometimes happens that a child who memorises willingly several lines of poetry revolts when he is given a large amount to learn Successful experience must always be within grasp of the child so that he may gain the satisfactions that come from achievement. And no so-called normal child will eagerly achieve the word for word reproduction of acres of lines in the literary field

Memorising As Punishment Deplored

Certainly though memorising is not with out merit—if used with discretion Now Lorna really dreads it Once she had to learn fifteen lines when she stayed after school because she d talked in quiet time From then on learning flow of words was only a distasteful chore She limped and stumbled over words that day clock conscious She never could repeat them accurately and thus the beauty of original lines was lost She saw them only as a series of demanding words instead of symbols of thoughts that never could be well expressed if it were not for them

Thus memorising must never become a form of punishment, or pleasure is crushed before it is born

Value In Original Words

Memorisation truly is essential to mastery for one never fully knows a poem until he knows its language Only when he has spoken it himself does it become a true part of experience Once alterations are made in thought and phraseology, original effectiveness is gone

Arnold learns lines too He sparkles as he spouts them I think I know just how the poet felt that day He wanted to fly way up high Only he didn t have a plane or any wings So he found words to do the flying for him. Truly to have memorised the language of the poem is to have re lived the emotion of the poet at the time of writing

Natural Learning Favoured

When the children find a selection they enjoy and then work on polishing of lines the learning is not forced but natural a kind of planned remembering with difference in connotation. If they approach it with sincerity with understanding and with eagerness ease of memorisation comes to them

Certainly unless the child can see the value of the lines involved he has no gain in memorising them I don t see why we have to learn *that* stuff ! Jim grumbles openly with attitude both black and blue suggestive of the damage done already

Because I told you to ! Those words so terse from Mr Williams do not help in any way Yet what a chance here for the teacher to guide Jim into seeing values to open doors now barred to true appreciation !

Miss Towsley however meets the challenge. An academic magician is she for by her skillful use of words her insight and her understanding she shapes attitudes of eagerness from those of real unwillingness she inverts drooping mouths and makes them into smiles She knows how to untie the nots from the I don t s making them I do -ers

Why would you want to drop the course? she asks of them Let s drop instead the adverb ? Now who wants to memorise ?

I do ! comes the chorus

Concerning Student—Selected Lines

It has often been found much better when the child has been guided into understanding lines that he be allowed to choose the ones he wishes to remember

Can t we pick out the ones we want ? asks Penny, like an eager shopper

' No! roars Mr Springer He s twice as big as she is so he s entitled to his two cents worth He ll show them he s boss here even though he s Mr Meek at home The fact that he is hen pecked puts him in a mood that s fowl And enthusiasm blacks out like a television picture when a tube gives way

Mrs Green nods happily, though when Freddie asks her Faces brighten and eyes fly bird like over lines but recently grown meaningful

At times the child is much surprised at his remembering those lines that he has said because they bring him pleasure Jeepers I didn t know that I could say that ! Harold exclaims with happy incredulity Quite without warning it suddenly seems to him the lines are his and he is pleased for he has made no conscious effort to memorise

When he chooses consciously what lines to learn, he should understand that he must always carry through without abandoning a thought or line because it overruns the number that has been assigned No noon day whistle must blast him from a scaffold with the bricks half laid

Values In Memorising Great

Some teachers use another means of motivating memory work Mr Johnson lists the worthy passages and boys and girls discuss their literary value and in the special study of the lines they tend to learn unconsciously the lines to which he has intentionally exposed them

Whatever worthy technique is used however we must acknowledge that there is value in retaining the original words of a thought artistically expressed for in repeating worthy words of another one tends to have awareness of the poetic way of looking at life It makes for a heightened sensory reaction a keener sense of value for words

Surely teachers should recognise that in most cases poetry can be learned with comparative ease by little folks as well as by big and that through thoughtful guidance of the students into a willingness and eagerness to learn the poet s words teachers can perpetuate pleasurable experiences a thought as warming as a cup of steaming tea

Certainly in the words of Hilda Conkling are found artistry and truth

> Loveliness that dies when I forget
> Comes alive when I remember ••••

A DECADE OF INDIAN NAVY

IN the long chequered history of the development of India s naval forces the period after independence has been most significant During the past ten years emphasis has principally been laid on modernisation of the Fleet and the shore training establishments on progress towards early achievement of self sufficiency in the sphere of training and on nationalisation of the Service Steady progress is being made in all these directions Contributing their share towards an early fulfilment of the great responsibility of ensuring the country s sea-defence are the people hailing from all parts of the country professing different faiths and belonging to various castes and creeds, working as a team in the Navy

One of the fields in which naval activities during the past ten years have unfolded their usefulness is the role of this Service in carrying India s message of good will and friendship to countries near and far During their goodwill missions ships of the Indian Fleet have so far visited over 25 countries in East Asia West Asia Africa and Europe

Independence And After

Before the dawn of freedom—August 15 1947—India could hardly be said to have a Navy of her own What small force of ships and escort vessels existed was merely an adjunct to the Royal Navy although it did useful work during World War II This small force was further reduced owing to partition of the country in which roughly one third of it went to Pakistan together with three of the most important naval establishments

India therefore had not only a great deal of leeway to make in developing her Navy but had also to begin almost from the beginning Besides there were other problems that called for attention—modernisation of armament and equipment, re-orientation of training methods and above all the gradual Indianisation of the Service

Formation Of Flotilla

With the acquisition of the 7030—ton Leader Class Cruiser *I N S Delhi* (the former *H.M S Achilles*) in 1947 a beginning was made in the matter of Fleet expansion primarily for meeting the Navy s training requirements It was followed by the purchase of three destroyers *H M S Rotherham Redoubt* and *Raider* and later renamed *Rajput Ranjit*, and *Rana* respectively With these was formed India s first Destroyers Squadron

Simultaneously with the frigates and minesweepers which came to India s share after partition a Frigate and a Minesweeping Squadrons were formed Yet another Frigate—*Tir*—which was for sometime used as Boys Training Ship was later converted as a Junior Officers Training Ship

The Navy later acquired three "Hunt class Destroyers—renamed *Godavari Gomati* and *Ganga*

Modernisation Of The Fleet

In the development of the Fleet a suitably phased out modernisation programme is being implemented Its salient feature is acquisition of new and modern ships A beginning has already been made in this direction with the acquisition of two Inshore and four Coastal Minesweepers and some frigates of the latest type

Recently to join the Fleet is the 8,000-ton Colony Class Cruiser—I N S *Mysore* formerly known as H M S *Nigeria* Completely modernised the *Mysore* will be one of the most powerful units of the Flotilla The latest and an important acquisition of the Navy is the 15 700 ton aircraft carrier—H M.S *Hercules* The *Hercules* is now being modernised and refitted in the United Kingdom

Training Centres

In the sphere of naval training and the shore establishments the emphasis during the past decade has primarily been on achievement of complete self-sufficiency at an early date and notable progress has been made in this direction The task has not been easy in view of the fact that India on partition, lost three of its best training establishments and a number of experienced officers and men and that the Service was faced with a difficult problem of finding the necessary personnel and train them

At the National Defence Academy at Khadakvasla the naval cadets of the Joint Services Wing do a combined course for three years and then continue their training at I N establishments and ships

The principal training centres that India got on partition are I N S *Shivaji* the Mechnical Training Establishment situated at Lonavla (Bombay State), and I N S *Valsura* the Electrical school at Jamnagar in Saurashtra In 1948 were set up the two new training centres—I N.S *Venduruthy* at Cochin and I N S *Circars*, the Boys Training Establish ment, at Vishakhapatnam The Cochin Base is now the largest naval training establish ment with various courses for officers and men All the training centres are now being fitted with the latest equipment and housed in permanent buildings some of which have al ready been completed

A notable achievement in this sphere is that today the entire training of ratings and most of the officers is undertaken in this country except in cases requiring highly spe cialised training for which facilities are not yet available here Some of the foreign navies are also availing themselves of the facilities in India in training their own personnel.

The expansion of the Naval squadron also necessitated an expansion of the Naval Dock yard and other establishments at Bombay—the homeport of the Fleet. The Dockyard expan sion has already been taken up to be completed by stages and work is now progressing on the construction of a cruiser graving dock whar ves for destroyers and frigates A dredger has been purchased from West Germany for the purpose

Naval Aviation

One of the recent developments in the Navy has been the formation of a shore based Fleet Requirement Unit which forms part of its programme for the development of naval avia tion This programme has now assumed greater importance with the acquisition of the aircraft carrier *Hercules*

The first Naval Air Station was commis sioned as *Garuda* at Cochin in May 1953 At present some amphibious Sealand aircraft and target towing Firefly planes form part of this unit Some air training schools have also been set up at *Garuda*.

Yet another branch of the Service to be developed is the Hydrographic Branch Three of the Naval ships—*Jumna Investigator* and *Sutlej*—specially converted for the purpose of carrying out surveys of the Indian coast have been busy with this work of national impor tance In the plans to build warships in India, the construction of certain vessels has been entrusted to the Hindustan Shipyard at Vishakhapatnam

Indianisation

One of the principal aims of the Govern- ment since independence has been to comple tely "Indianise" the Navy as early as possible and without detriment to its efficiency Except for the appointment of the Chief of Naval Staff—now held by Vice Admiral Sir Stephen Carlill—and of four others this process has been completed In October 1956 the first Indian Admiral—Rear Admiral R D Katari took over as the Flag Officer (Flotilla) Indian Fleet

Important Events

On January 26 1950 when India declared herself a Republic the Service dropped the title *Royal* which had been associated with it for long and since then it came to be known as the Indian Navy with the White Ensign yielding place to the Indian Naval Ensign

The next epoch making event in the history of the Navy took place on May 27 1951 On that day the President Dr Rajendra Prasad as the Supreme Commander of India s Armed Forces presented the President s Colour to the Navy at a spectacular ceremony held in Bombay Two years later a Naval Review the first of its kind, was held at Bombay when the President reviewed the entire Fleet

Navy Bill

The Navy Bill, consolidating some of the existing legislations in regard to this Service and aimed at filling some lacunae that existed in the general procedures governing discipline and other naval matters was passed by Parlia- ment recently

THE PROBLEM OF WEST IRIAN

By Prof SAILENDRA NATH DHAR

THERE is a fresh crisis in the relations between Indonesia and its former master the Kingdom of the Netherlands Indonesians seem this time determined to be fully and truly sovereign in their own homeland and no matter the costs or the consequences to be masters of their own destiny They had won their freedom from Dutch colonial rule in 1949 but that was subject to so many reservations economic political military and cultural to the advantage of the Netherlands and to their own disadvantage that the future of the new born Republic had seemed to be gravely imperilled Among the concessions which the Dutch had secured one that most embittered the feelings of the Indonesians was the retention by the former of West Irian subject though this was to the stipulation that its future status was to be determined within one year through negotiations between the two governments

Negotiations for the transfer to Indonesia of this last remnant of colonial rule were duly held over a number of years but they did not yield results In its desperation Indonesia carried the matter to the General Assembly of the United Nations in 1954 arguing that if the question was not solved it would remain a threat to the peace and security in that part of the world The question was discussed in the First Committee which adopted (by a vote of 34 to 14 with 10 abstentions) a resolution requesting the two governments to pursue their endeavours to find a solution to the dispute However the resolution failed to gain the requisite two-thirds majority in the plenary session and the Assembly took no decision on the question

The hopes of the Indonesians rose when at the Bandung Conference a formal resolution supporting their position on the subject was passed and the matter with the conference s well publicized recommendation was re introduced in the tenth session of the General Assembly The Assembly however restricted itself to passing a resolution expressing hope for the success of the talks which as announced by the two governments were to be resumed The hopes were shattered in February 1956 when the negotiations in Geneva broke down completely and the Indonesians thereupon unilaterally abrogated the 1949 treaty At the eleventh session of the Assembly a resolution was moved by thirteen Asian and African nations seeking to establish a Good Offices Commission consisting of three members for assisting in negotiations between the Governments of Indonesia and the Netherlands But as the requisite two-thirds majority could not be found to support it the Assembly as in 1955 could not take any action in the matter The Assembly at its twelfth session this year has similarly failed to deal with the question

The failure of the United Nations to intervene to solve a dispute which has plagued the relations not only between the two contestant Governments but between the Western powers and the new nations of Asia and Africa has released a chain of consequences, the end of which cannot be foreseen In their exasperation the Indonesians have resorted to direct action as a mark of protest against the continued retention by the Netherlands of West Irian and with the object of straightening out the relations between them and their former rulers in a manner consistent with their national dignity and interests It is reported that workers in some of the biggest Dutch enterprises in Djakarta and elsewhere have seized them in the name of the nation and that the Government have backed their action by placing the institutions under their own management The latter are also reported to have ordered all Dutch Consulates to close down immediately and asked Dutch diplomats to cease all their activities in the press cultural, and military fields

These and other anti Dutch measures adopted by the Indonesians bespeak a national resolve to settle not only the question of West Irian but the problem of ending the last vestiges of colonial rule This was made perfectly clear by Dr Subandrio the Indonesian Foreign Minister when, in a press statement reported from Djakarta on December 5 last, he said We want friendly normal relations with the Dutch without the interference which exists at present. What we want is something like Britain s relationship with India In other words Indonesians want not only to get back West Irian which provides the Dutch with a base of operations against the Republic should circumstances permit

them to launch another military attack on its territory but to free themselves from the economic stranglehold which is round their necks with the Dutch still controlling all the Indonesian key industries They want to prevent the Dutch from interfering in their domestic politics which with their entrenched position they freely do by setting Indonesians against Indonesians and also to be away from the unknown but grave dangers of being drawn into the vortex of Cold War politics The last named possibility already looms on the horizon since the Dutch are reported to have placed the dispute before NATO of which they are a member West Irian in this context is a vital issue, even a question of life and death for the Republic

The island of Irian (or New Guinea) which extends over some 260 000 square miles of mountain jungle and swamp is situated to the north of Australia the east of the Indonesian archipelago and just south of the equator It is now divided into the Australian administered Trust Territory of New Guinea and the Non Self Governing Territory of Papua on the one hand and the Dutch administered Non Self Governing Territory of Netherlands New Guinea (West Irian) with which we are here concerned is thus a little more than half an island which is just one of the 3000 and odd islands which comprise the Indonesian archipelago It was included in the former Dutch colony of Netherlaads East Indies now named the Republic of Indonesia ('Irian means hot country — iri standing for land and an for 'warm The name New Guinea by which the island is generally known is derived from a Spanish Latin word)

Twelve times the size of Holland and about as large as Japan, West Irian was so far removed from the industrialized world that its inhabitants first glimpse of it was General MacArthurs s Superforts in 1944 It was so little known even to its Dutch rulers that when American and Australian planes surveyed it in the war against Japan they discovered that there were four times more people living in the territory than Dutch official figures had suggested a million where Dutch official estimate was 250 000 Of the population only about a fourth part had been brought under Dutch administration of the remainder the great majority consist of tribes speaking hundreds of dialects living nomadic lives with no money economy rarely wearing clothes or when doing so wearing only a loincloth made of labu fruit (a kind of pumpkin) To colonial rulers they were of no significance they were living in thousands of villages too remote to be accessible they were producing nothing that was economically worth while they were at the most scientific specimens

The Dutch who now cling most determinedly to their right in West Irian never in all their more than three hundred years rule over it did anything either for the land or the people The only interest they had was in just seeing to it that it could not be used as a stepping stone for British or Spanish intruders, a danger to which its situation so near the splendid Spice Islands was apt to contribute It was not till the last few decades of the nineteenth century when with the entry of Germany in the colonial field a fresh period of international rivalry commenced that the Dutch awoke to this outpost of their empire Sensing the German danger Australia proclaimed the annexation of that part of the island of New Guinea which the Dutch had never considered within the sphere of their influence In the First World War the Germans recognized the value of West Irian harbours their raider the Emden was hidden in Fak Fak Bay for overhaul when the Australian navy searched for it in vain for a month At the close of the war Australia acquired north east New Guinea as a mandate it is now virtually an Australian colony Another rival to the Dutch monopoly appeared soon afterwards in the Japanese who found in the thinly populated undeveloped territory of West Irian a solution of their overpopulation problem When Japan suggested a joint exploitation of West Irian and asked, in furtherance of this plan for permission to import a thousand Japanese families the Dutch in a panic turned down the suggestion not because they did not require more workers but because they had got wind of Japan s desire to build a naval base in the territory

The strategic importance of West Irian became clear as soon as Japanese bombs fell on Pearl Harbour Situated at the intersection of two ocean the Pacific and the Indian Ocean and of two continents Asia and Australia it was destined to play a vital role at the beginning and at the end of the Second World War During the course of the struggle it served as the last line of defence for Australia whilst General MacArthur used Hollandia as an advance base from which his troops began their island hopping campaign which took them step by step to the shores of Japan The strategic importance of West Irian did not diminish a bit after the defeat of the Axis

Powers It was the only bit of territory now left to the Dutch in the whole continent of Asia and they can always use it as a spring board against the Indonesian Republic It is alleged in the Indonesian press that they are with this purpose in view, constructing air fields and landing strips in this territory and that from here they are giving their support to the terroristic organizations operating in Indonesia It is also alleged that the USA is planning to convert Western Irian into an aggressive SEATO base, and that American monopolies interested in the natural resources of the territory including great oil deposits, are exploiting them jointly with Dutch companies The independent non alignment policy pursued by the Indonesian government headed by Dr Soekarno who is suspected to have strong communist sympathies increases in Cold War politics the necessity for a Western base in the Indonesian archipelago which may serve in various ways the interests of the free world The visit of President Voroshilov of the USSR to Indonesian in May, 1957 followed by the return visit of the Indonesian Premier Mr Ali Sastroamidjojo to Moscow in July last and the official declaration of the USSR government in the support of Indonesia s claim to West Irian, have influenced the attitude of the Western Powers towards Indonesia

In support of their case for the retention by them of West Irian the Dutch are using many arguments—legal moral political. They say that under Article 2 of the Charter of Transfer of Sovereignty '*the status quo* of the residency of West New Guinea is to be maintained meaning that the complete sovereignty over the territory which they exercised prior to the transfer is to remain with them As against this there is the Indonesian contention that since the Charter had granted, in Article 1, 'unconditionally the 'complete sovereignty over the Netherlands East Indies to the new Indonesian Republic West Irian which had been an integral part of the Netherlands East Indies now belonged in sovereign right to the new Republic. Indonesians say that the term *status quo* refers only to temporary administrative control over an area subject to the terms of the Charter of Transfer of Sovereignty

The Dutch have argued that the inhabitants of West Irian are not Indonesians and that by far the greater part of them are still in a very primitive condition owing to which it is unable to express itself politically They say that there can be no transfer of sovereignty without consultation of the inhabitants, who at the appropriate time would be accorded the exercise of the right of self-determination They claim that they are in a better position to promote the educational social and political advancement of the population than Indonesia and argue that the paramount consideration by which the case should be decided is the interests of the population The Indonesians reply to these arguments by saying that the question of self-determination does not arise at all since West Irian was and is a part of the national or political entity known as Indonesia and that the problem should be treated as a legitimate dispute between two sovereign powers As for the argument that the West Irianese were not Indonesians this they say is irrelevant, since Indonesia was not a racial term, but a national and political one They charge the Netherlands Government with having completely neglected the welfare of the West Irianese people and consider their expression of solicitude for it as belated and intended simply to bolster up an argument Above all 'they assert that West Irian is essentially a colonial problem since the only basis for Dutch power in the East Indies had been colonial conquest. They plead that the West Irianese are human beings citizens of the Republic who can transform their Stone Age lives only when they are freed from colonialism Indonesians as said President Soekarno once, do not like to advance arguments touching the question of ' intelligent-or not intelligent Irian—having the same blood as we-or not , but on the question of colonialism or non-colonialism independence or dependence '

(Courtesy—The Vigil)

KAZAKH SAYINGS

The gentle word will entice even a snake out of its hole

* * *

The morning will come even without the cock.

* * *

Don't act the chicken for him whose millet has ripened

* * *

Fear the locust and you ll sow no grain

Intelligence Test

(Below are given some questions to test quickness of your mind and intelligence It does not matter that you attempt all the questions What matters is the time taken by you to find the correct answers The whole paper should not taken more than 30 minutes to a fairly intelligent person Try now and find out)

—QUESTIONS—

1 Which is the best reason why people wear rubber soles on their boots?

(a) They are fashionable
(b) They make no noise
(c) They make the soles last longer
(d) Rubber is more porous than leather

2 Do as directed

(a) Write the last letter of the word in this extraordinary sentence that has more than twelve letters

(b) Write down the number of letters in the fourth word in this sentence unless a cow is bigger than a cat in which case write the word Rat

(c) If a dog has two noses and one eye write the word yes if he has two eyes and one nose write the word no

(d) Write the number that comes before the number that comes before fourteen

(e) If Liverpool is in Scotland write the word 'Dublin, but if it is in England write the word Scotland

(f) If this sentence contains more words of less than three letters than words of more than three letters write the first letter of the last word if it contains less write the last letter of the first word

3 Give the next two numbers in each row

(a) 2 3 6 7 10 11
(b) 9 12 10 13 11 14
(c) 8 9 11 12 14 15
(d) 2 4 5 10 11 22
(e) 1 2 4 7 11 16

4 Look at this sentence World foot ball marble melon are all (solid eatable round small) There is one and only one of the 4 words in brackets that would make the sentence true That word is "round" Now answer the questions by writing down for each one the word that makes the sentence true

(a) Honey Jam saccharine, treacle are all (liquid sweet, sticky manufactured)
(b) Diamond, platinum radium, pearls are all (rare jewels trans parent round)
(c) Greyhound aeroplane, bullet motor-car are all (metallic, self acting swift munitions)
(d) Grass wood, apple cactus are all (green, eatable, medicinal, vegetable)
(e) Ant grain point mite are all (hard prickly, elongated, minute)

5 The following statements are absurd. Point out the absurdity in each case:—

(a) A hunter who had used up all his ammunition was chased by a bear A bright idea struck him he would climb a tree When he got to the top he remembered that the bear could also climb a tree but he got out of his difficulty by pulling the tree up after him

(b) A forgetful man once tied a knot in his handkerchief to remind him of some thing but he suddenly remembered that the last time he did this he could not recall what he had to remember So this time he tied two knots to make sure The first knot was to remind him that he had to remember something the second to remind him of what that something was

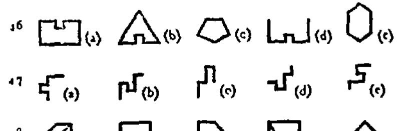
(c) Light comes from the sun feathers are light, therefore feathers come from the sun

(d) A sailor who was put to haul in a rope from the sea found it so long that he

gave it up in disgust saying that somebody must have cut the end off

6 The sentence given below is printed in cipher figures are put to represent letters Translate it The following acts will help you

(a) There are in the English language very few words of one letter



(b) The letter most frequently occuring at the end of words is e

(c) 8 is used for a letter which resembles it most in print

(d) 3 stands for l and 4 for t

2 870 4574 2 078 7 324431 3741

7 Here are five sets of figures There is one odd (unusual not similar to the rest) in every set Point out the odd figure and its oddity or strangeness as compared with other figures

8 The sentences in the following questions are followed by a series of sentences A, B C D E F G which are similar in meaning to the sentences in the questions You have to find out which sentence is similar to the one in the question and write down A or B or C as the case may be

(i) Take care of pennies and the pounds will take care of themselves
(ii) All work and no play makes Jack a dull boy
(iii) Curiosity killed the cat
(iv) Strike while the iron s hot
(v) Never look a gift horse in the mouth
(vi) A burned child dreads the fire
(vii) Clothes make the man

A Do not pick fault with presents

B If you are careful over small matte[rs] big matters will never worry you

C Always take your chance when [it] appears

D If you never have a change you w[ill] become stale

E Mind your own business so that y[ou] do not fall into danger

F Once you have experienced a thing you know what will happen next [time]

G A well turned out appearance is [a] good recommendation

9 In a pen there are rabbits and pheasants. They have altogether thirty five heads and ninety-eight feet How many rabbits are there ?

ANSWERS

1 C

2 (a) Y (b) Rat (c) No. (d) 12 (e) Scotland (f) f

3 (a) 14 15 (b) 12 15 (c) 17 1[?] (d) 23 46 (e) 22 29

4 (a) Sweet (b) Rare (c) Swift (d) Vegetable (e) Minute

5 (a) The tree could not be pull[ed] up by man if he h mself was on it.

(b) Two knots could remind him remember more than one thing

(c) The word 'light is used [in] two different senses

(d) If the end were cut of[f] there would still be an end

6 I saw that I was a little late

7 (i) (d) All other figures [are] enclosed from all sides except (d)

(ii) (c) Every other figure has a rectangle with both the arms but (c) has only one arm

(iii) (a) This is the only figure with an equilinear triangle

(iv) (a) This figure has three compartments while all other figures have four compartments

(v) (c) This figure is not symmetrical while all other figures are

8 (i) B (ii) D (iii) E (iv) C (v) A (vi) F (vii) G

Question Box

In these columns we answer the queries from our readers It may not be possible to answer each and every question but a considered reply shall be given to selected questions Letters from our readers are welcome These should be addressed to the **Editor, Question Box**

MINISTER OF STATE AND CABINET MINISTER

Q Please explain the difference between a minister of state and cabinet minister in the Central Ministry —*A Kumar Tinsukhia*

Ans A Cabinet Minister attends the Cabinet meetings while a Minister of State does not otherwise their duties and responsibilities are similar

SPORT TERMS

Q Kindly explain the following terms — Mid on Half volley Googly

—*Monoj Mohan Das Asansol*

Ans Mid on A term in circket applied to a position in the field

Half Volley is a return by striking the ball just as it touches or rises from the ground a term in tennis

Googly An off breaking ball with an apparent leg break action on the part of the bowler and conversely a leg breaking ball with an apparent off break action ont he part of the bowler a term in cricket

ELECTION OF U S PRESIDENT

Q How is the President of the U S A elected ? —*De Prodyot Kumar Midnapore*

Ans The method of election of the U S President is prescribed by the constitution thus Each state shall appoint in such manner as the legislature thereof may direct a number of electors equal to the whole number of Senators and Respresentatives to which the State may be entitled in the Congress but no Senator or Representative or person holding an office of trust or profit under the United States shall be appointed an elector In every state the electors are chosen by the direct vote of the citizens According to the constitution the Congress may determine the time of choosing the electors, and the day on which they shall give their votes which day shall be the same throughout the United States The state electors are elected on the first Tuesday after the first Monday in November of the year (every leap year) preceding the year in which the Presidential term expires They meet at their state capitals on the first Monday after the Second Wednesday in the December following their election There they vote by ballot the votes are then sent to Washington and opened on the sixth day of January by the President of the Senate in the presence of both Houses of Congress The candidate who has a majority of the whole number of votes cast becomes President If no one has a majority then the House of Representatives elects a President from the three highest in the list the votes are taken by states—each state has one vote

CONGRESS AND THE SOCIALIST PARTY

Q What are the political differences in the ideologies of Congress and the Praja Socialist party of India

—*Z R Faruqi Unnao*

Ans *Indian National Congress*—The object of the Indian National Congress as adopted in 1948 is the well being and advancement of the people of India and the establishment in India by peaceful and legitimate means of a Co-operative Commonwealth based on equality of opportunity and of political economic and social rights and aiming at world peace and fellowship The Congress advocates a democratic secular Government with a Welfare State as a goal It endeavours to maintain a strictly independent position in world affairs

Proja Socilist Party formed by the fusion of the Socialist Party and the Kisan Mazdoor Proja Party declares as its objective the establishment of a democratic socialist society in India

COMPULSORY LANGUAGE

Q Are there two (one Hindi and other regional) languages compulsory in every state? If so upto which class?

—Harish Chandra Saxena 'Khak Allahabad

Ans Regional language is compulsory at the Primary stage in every state If the regional language is not Hindi it is taught as a compulsory language at the Secondary Stage But this is only a general principle Some states follow it with greater vigour than others

BLACK MAILING

Q What is blackmailing?

—Bhuwaneshwar, Muzaffarnagar

Ans Blackmailing was a rent or tribute formerly paid to robbers for protection Now it is understood as extorting money from a person under threat of exposure, especially of a baseless charge

U N MEMBERSHIP

Q Mention the important countries as yet excluded from U.N O

—Sitanshu Chatterjee Asansol

Ans 80 countries are the members of the U N O Others are not. The most important of the non member countries are the people s Republic of China and Manchuria

LANGUAGE OF GERMANY

Q What are the national languages of Democratic and Western Germany?

—Bubbar G Lal Khurja

Ans The Federal Republic of Germany (Western) and German Democratic Republic (Eastern) both have German as the national language

SCIENTIFIC TERMS

Q What do the following mean?

—Nural Alam Sibsagar

i Agronomy ii Geophysics
iii Pharmacology iv Cytology
v Petrology

Ans i *Agronomy* Science of agri culture

ii *Geophysics* Science dealing with the physical aspects of the earth

iii *Pharmacology* Science dealing with the preparation of medicin es

iv Cytology Science dealing with the development of organic cells

v Petrology Science dealing with petroleom

ABBREVIATIONS

Q What do the following abbreviations stand for

ANZUS IOU O G L TWA.

—R N S Varama, Patna City

Ans A N Z U S Australia New zealand, United States of America (Pacific Pact among the three countries)
I O U - I owe you
O G L - Open General Licence
T W A Trans - World Airlines

LOCATIONS

Q Where are the following

—Uttarn Kumar Batala

1 Pilani 2 Gulmarg 3 Kurnool

Ans Pilani In Rajasthan centre of Education

Gulmarg In Kashmir a health resort

Kurnool In Andhra, formerly capital of the state

DEMOCRACY

Q We have scrapped the Divine right of kings we cannot adopt the Divine right *of majority Government —Lord Acton* Please comment

D D Sharama, Ajmer

Ans In democracy it is the majority party which has the reins of the government in its hands though it may be in the ratio 51 49 It may do good if the opposition is strong but even then it is no guarantee of good government This quotation does not give an alternative Referring to Indian democracy Shri J P Narayan said Democracy would have to be built up from the village community upwards and not by doling out precepts from New Delhi and we may apply this statement to the general conditions of good government every where

SANGEET NATAK AKADAMI

Q Please explain the working of Indian Natak Kala Academy?

—Paras Mehta Udaipur

Ans *Sangeet Natak Akadami* The main task which the Sangeet Natak Akadami in augurated in January 1953 has set for itself is survey of and research in the different art forms of the country In order to preserve them as part of our cultural heritage, they are

to be recorded and filmed, The Akadami also publishes or encourages the publication of material about them To develop these arts and make them popular it organises and sponsors seminars and festivals establishes new art institutions or takes over the existing ones whenever possible or desirable The Akadami has given recognition and grants to about 150 organisations

LAW OF DIMINISHING RETURNS

Q 'The law of diminishing marginal returns is both a logical necessity and an empirical fact Please explain

—Tulsi Kumar Banerji Madhupur Bihar

Ans Generally speaking the statement is correct but there are certain aspects of economic life in which it does not apply as for example agriculture The law assumes that conditions of cultivation are static and not dynamic as they actually are Therefore we find that in actual practice man s ingenuity is ever striving to counteract the operation of this law by improving the technique of cultivation Scientific rotation of crops improved seeds modern implements artificial manure and better irrigational facilities, etc are bound to give increasing return

LIFE IN FROZEN WATER

Q How is it possible that fish can live and move in frozen lakes ?

—Mohd Yusuf Calcutta

Ans Water is the heaviest at 4 C Therefore it always sinks to the bottom. When the upper surface of the lake is frozen there is still some water at the bottom at 4°C Fish and other sea creatures can live and move in it

HEADQUARTERS OF U N BODIES

Q Where are the headquaters of various international organisations which are organs of or affiliated with the U N O ?

—Shrinath Srivastava Lucknow

Ans 1 General Assembly and the bodies connected with it—New York U S A

2 International Court of Justice, The Hague, Netherlands

3 International Labour Organisation—Geneva, Switzerland

4 Food and Agricultural organisation—Rome Italy

5 UNESCO—Paris France

6 International Civil Aviation Organisation—Montreal Canada

7 International Bank For Reconstruction and Development, and

8 International Monetary Fund—Washington U S A

9 World Health Organisation-taion—Geneva Switzerland

10 Universal Postal Union—Berne Switzerland

11 International Telecommunication Union—Geneva Switzerland

12 World Meteorological Organisation—Geneva Switzerland

ALL INDIA CENTRAL SERVICES

Q What is the difference between All India Services and Central Services ?

—Shbhash Chandra Jain Roorkee

Ans Services like the I A S and I P S are all India Services because they cover the whole of India Central Secretariat Services and other services like that are Central Services because they cover only those departments which are centrally controlled

FOUNDER OF JAINISM

Q I read in the January 1958 issue in the regular features General Knowledge Test that Mahavir is the founder of Jainism Mahavir is not the founder of Jainism Bhagwan Adinath (or another name) Vrukshnath is the founder and first Tirthankar of Jainism Mahavir is the last and 24th Tirthankar of Jainism

—Hukumchand Maganlal Jain Nagpur City

Ans We quote below from the *Discovery of India* by Jawahar Lal Nehru and *An Advanced History of India* by R C Majumdar H C Raychaudhari and K Datta

Mahavir the founder of Jainism and Buddha were contemporaries Discovery of India 1956 Edition page 109

In the thirteenth year of his penance Mahavir repaired to the northern bank of the river Rijupalika outside Jrimbhikagram, a little known locality in eastern India and attained the highest spiritual knowledge called Kevala jna He was now Kevalin a Jina and Mahavira He became the head of a sect called Nirgranthas known in later times as Jainas or followers of the Jina

Advanced History of India 1956 Edition page 85

LETTERS to the EDITOR

Letters from the readers giving their own opinion or point of view on all interesting subjects are published in these columns Letters should be brief, to the point, neatly typed, double space They may be written under a pseudonym but must be accompanied by writer's name and address The views expressed here do not necessarily reflect editorial opinion or policy

THE SWITCH OVER FROM ENGLISH TO HINDI

Sir,

The joint memorandum submitted by some members of the Parliament to Mr Nehru opposing the main recommendation of the Official Language Commission should receive favourable consideration of the authorties concerned Their suggestion that the replacement of English by Hindi as the official language of India should be postponed 25 years beyond the date proposed by the Commission to prepare the public for this important linguistic change, deserve support of the public as well

We should not think of *one* side only, *i e.* to prepare the public and the Governmental machinery only—during the period of transition We should *also* prepare the language and its script to fit in with the requirements immediately after the change over

In order to be fit for acceptance as a *lingua franca* for a vast country like India with so many languages and dialects a language must have

(a) a grand vocabulary, self sufficient in all respects

(b) a simple grammar

(c) a scientifically simple script with quality of acquiring speed in writing, and

(d) a rich literature

Before coming to a decision in this matter there should be an endeavour to chalk out a plan so as to prepare the language for the change-over, in respect of the above points

(a) *Vocabulary* To enrich the vocabulary although work is in progress to coin and collect equivalent words/terms for scientific and legal words and expressions etc there should be an effort to pick up as many suitable words as possible from other Indian languages and foreign also if necessary, and popularize them through the Hindi medium This will give the language an all India character

(b) *Grammar* A language with a complicated grammar cannot surely be popular The grammar of the Hindi language needs to be simplified so as to make its learning easy, specially in the areas where Hindi is not at present the language of the people

(c) *Script* It is needless to emphasize the demerits of the Hindi alphabet in respect of simplicity and speed Modern age is the age of Speed Unless we modernize the script by simplifying it so that it can attain speed in writing it will not be popular to the extent desirable

(d) *Literature* Just as attempts are being made to enrich the Hindi literature by translating literary works from foreign languages there should be an extensive endeavour in the direction of translation of famous books of all the major Indian languages into Hindi, so that a Punjabi can know about the literature of Madras and a Gujerati can taste the literature of Assam —and so on —through the medium of Hindi This will perhaps be the most effective means not only of popularising the Hindi literature, but also of creating unity in diversity

Our Government and the linguists of the Universities will we hope pay serious attention to this aspect of the question as well We are sure the present trasitionary period, if extended as suggested by the M.P.s will be sufficient to make not only the public but also the language itself fully prepared for a smooth change-over There should not be any hasty

and haphazard decision in such matters affecting a vast country like ours Let us hope to change for the better, and that too in a cool and calm way

Digboi (Assam) Yours etc
20-9 57 U Baruah

HINDI AS NATIONAL LANGUAGE

Sir,

Please allow me a little space in the esteemed columns of your magazine to bring out the deplorable case of our Rashtra Bhasha The danger was not so acute at the time of its consideration as a national language as it is facing it to day Hindi is not imposed on non Hindi speaking people but it is assisting to develop the common culture and heritage through its medium which is a necessary vehicle for a successful democracy Its language and literature are rich Its script is the best known scientific script in the whole world. Nearly three fourths of our population speak Hindi or its dialect in some form or other

Politically we are free but mentally we are still slaves How can we unite our country through a language which is foreign ? Opponents of Hindi do not understand the purpose of national language Men of high calibre like Rajaji plead the cause of English It is really shameful for us all Those people who are condemning Hindi are themselves to be condemned and criticised This is the policy which will lead to a split in our nation South India s support will help Hindi and I appreciate the endeavour of Kerala in this respect

Darbhanga Yours etc

BETTER TREATMENT FOR TEACHERS

Sir

The deteriorating standard of Education in India has recently attracted the attention of all concerned—the students teachers parents and the Government But a constructive and co-ordinated campaign to improve the standards of education is still in imagination and has yet to take concrete shape

Much time and energy have been wasted in the attempt to locate and blame the party who is responsible for this state of affairs This tendency of throwing mud on others is on the increase and the problem still remains where it stood originally On the one side students complain of the poor standard of their teachers and on the other hand teachers blame the students for their growing indiscipline and lack of proper interest in studies. Parents and Government appear on the scene as neutral spectators observing the situation in disgust

An impartial and independent inquiry will surely reaveal that all parties are at fault A thorough change and check up in the entire system of our Education is necessary to revitalize it and provide better opportunities for the evergrowing needs of our enterprizing and enthusiastic students

"The college years are years of rebellion, when boys and girls are trying to become adults in their own right and are struggling for independence from parents homes and values with which they have been closely knit It is difficult to see how a teacher without a constructive philosophy, can help them as they begin to formulate their own view of life

This apparently calls for better treatment for teachers As things stand now the profession of teaching is neglected and hence it has become the *last resort for persons who fail to get better paying occupations* This tendency is to be changed first because a noble profession like teaching deserves a better and a higher status in Society This is an urgent need which if done immediately will go a long way in improving the standard of our education These matters should be given a deserving consideration and should form an important item in the agenda for discussion while formulating future schemes for the betterment of the people and country as a whole

Kanpur Yours truly,
Kultar M.A.

KASHMIR AND WESTERN POWERS

Dear Sir

Even though we may elect to view the U N through rose-coloured spectacles it cannot be gainsaid that a just solution of the Kashmir problem continues to elude the grasp of this international body much to the chagrin of India which has all along resolutely pinned its faith on the machinery of the U N for a settlement of the dispute according to the canons of justice and fairplay The Kashmir issue has been so conveniently drawn into the vortex of power politics with all its unseemly features of cold war as to create a Chinese puzzle of putting both the aggressor and the victim on the same footing To right thinking people the revival of Graham Mission as per the latest amendment to the five-power resolution carried out in the Security Council will appear as nothing better than a stalking horse designed to drag the dispute resulting

in an exacerbation to India It might be good fun for the bluffing demagogues of Pakistan to keep the pot boiling with regard to Kashmir in order to apply a safety valve to and hold in leash the seething discontentment of the masses But not so for India which is expending all her energy and resources to wage an all out and relentless war against poverty di ease and other abominable conditions of life that obtain in this country and is thus engaged in a silent competition to demonstrate that democracy can hold its own against the allurements of totalitarianism if any to effect socio-economic changes

The pious resolutions on Kashmir passed by the U N from time to time may presumably haunt the minds of the leaders of Pakistan like a tantalizing refrain To India they can cause only nightmare The present posture of affairs threatens to succeed eminently in disillusioning us to the point of shattering our fond hopes of securing plain justice at the hands of the U N Ours is but a d mand of the U N simply to hold the scales even more so when India has unreservedly invested this international organ with the aura of an arbiter Naturally therefore it is high time that the U N decided to comport itself with some dignity Today there is every evidence to show that Mr Krishna Menon s forceful elucidation of the Indian case on Kashmir f ll on ears de fened beyond repair At the recent debate in the Security Council it was admirably driven home by the Indian spokesman as to how the military pacts to which Pakistan is a party have altered the whole context of the issue in question

Hence it is no wry comment or empty flourish when we ask the Western Powers to observe the rules of the game when it comes to a consideration of the Kashmir issue A clear and candid understanding of the fundamentals of the dispute will lead us out of the impasse which we are in at the moment How are we after all to forget that Kashmir has been a thorn in our flesh precisely because the West has preferred to blink the down-to-earth realities of the situation by embarking upon a policy of drift ? The time honoured maxim that justice delayed is justice denied must needs have an application in the international arena as well Or are we to take it that the West is using the Kashmir question as a pressure point against India for reasons of its own as and when it suits the Western Powers ?

THE NEW NAGA UNIT

Dear Sir,

The new Centrally administered Naga Unit has been inaugurated on December 1 1957 effecting its secession from Assam as an interim measure The people and the Government of Assam have conceded to this new decision of the Centre for the greater interest of the country and for the aspiration of the Nagas to maintain their distinctive culture tradition and the way of life though it is again t the interest of a problem state like Assam. ' I would particularly refer to the very liberal and gracious attitude of the Assam Government who once the Naga people had expressed their choice (in Kohima Convention) readily agreed to respect their wishes in the larger interests of a friendly settlement' said the Governor of Assam in course of his inaugural message It is no doubt a sacrifice on the part of Assam as movement for a separate Hills State sponsored by other hilly brethren of this state has been renewed following the decision of the Central Government for the Centrally administered separate Naga Unit which may virtually initiate a complete disintegretion of Assam If our Naga brethren think that they will prosper in every walk of life if they remain separate from us the people of Assam it is our duty to give them an opportunity of trial of their aspiration and that is why their wishes have been respected After all our intention should be such, if some one wants to remain separate, let us keep separate on friendly settlement, as I think

It is our earnest desire that our Naga brethren will avail this opportunity to develop themselves on their own way remaining under the direct administration of the Central Government as desired It would be unfortunate and quite detrimental to the general welfare of the Naga people if the section of the Nagas who are still opposing the new set up with their rebellious activities in pursuing their demand for independent Naga land fail to realise the futility of their demand The Nagas are not the only tribes there are many tribes besides the Nagas with their distinct cultures and traditions in different tracts of different states of India both in Hills and Plains who might have also demanded the so-called independent land outside India. But this is unrealistic and not feasible It will therefore be the duty of the loyal Nagas to tell the rebellious ones that if they continue their activities it will be to the injury of the general

iterest of the Nagas We would hope that the misled Nagas would come to their sanity

Lastly we would also hope that the separate Naga Unit would come again to its parent State of Assam ultimately to merge with and thus prove that they are also democractic in thought and expression

Gauhati Assam Yours etc.

WOLD CONFERENCE OF RELIGIONS

Sir,

When the dangers of cold war are still not fully receded after Russia invented rockets and sputniks but are expected to increase all the more if America also comes out successful in the very near future it was a high time that the various countries realized the catastrophe that would accrue from these most modern scientific inventions and held a conference of all world religions at Delhi to try to remove world differences and unify humanity in one knot Big countries like Russia and America are racing in scientific field to have victory over one another We have seen much of destruction and annihilation in disunity Our history of mankind is a sincere witness to it and is a good eye-opener The religion is a good guide which when sincerely followed removes all ignorance from our path and puts our steps on the correct terrace of higher and nobler virtues As per religion the worldly objects are not our concern instead we have to transcend them to catch the genuine reality of nature the real light of life and the universal wisdom of all pervading soul The very idea of the transcendental self which is all unifying and universal removes all the conflicts and chaos from the world Religion teaches that the reality is not an abstract substance which may be unrealizable instead it is practicable for a human being to realise it amongst his fellow beings in the society A real religion does not lead an individual towards agnosticism but towards an ideal which is attainable The greatest lesson of each religion to humanity is to greet its all species and meet the divine soul. In the kingdom of divinity and religion right is might and not 'might is right' prevails This is what Christ Buddha Mahavira and Gandhi ever taught To the Stoic the art of living wisely and to the Epicureans the art of living happily could be useful but to a religionist the art of living ideally is the highest good Truth consists in one s realisation of soul one s realisation of social self Religion paves the way for it No religions of two entirely different countries are different ultimately Though their approach may be a bit different yet the destination cannot be conflicting the ultimate goals cannot be two The best advantage of holding the world conference of all religions could be to remove the various differences in their different approaches to one single reality It is much praiseworthy that the World Conference has passed the resolution to open various religious research centres where attempts would be made to bring the conflicting elements of humanity to unity

NATIONAL CADET CORPS

Started in July 1948 the National Cadet Corps reached a strength of 1 42 057 by the end of March 1957

The future expansion of the Corps is now an integral part of the Second Five Year Plan the proposed increase in strength being aimed at 30 000 cadets per year This will enable allocation of a Unit practically to every college and a Unit of every type to each of the States besides providing for substancial expansion of the Girls Division

The chief aims of the National Cadet Corps (N C C) are (i) stimulation of interest in the defence of the country (ii) building up of a reserve of potential officers to enable the Armed Forces to expand rapidily in a national emergency and (iii) development of leadership character comradeship and the ideal of service

The N C C consists of three main Divisions namely Senior Junior and Girls Senior and Junior Divisions are composed of three Wings—Army Navy and Air Force

The cadets are given training in practically all the subjects and weapons given to regular personnel of the Armed Forces

An important aspect of the training given to N.C.C cadets is the social service work undertaken by them At the social service camps each of about two to three weeks ducation held in all the circles of the Corps from time to time cadets undertake manual labour beneficial to the rural community

GENERAL KNOWLEDGE TEST

Test your knowledge Solve the following questions without any extraneous help When finished look up for the answers and compare Try and see.

QUESTIONS

1 (a) How is the President of the Indian Republic elected ? For how many years does he hold office ? (Your answer should be in about 8 lines)

(b) Name the States and territories of the Indian Union

2 (a) Describe in not more than five or six lines the national flag of India

(b) Who wrote the Indian National anthem ? What is the name of another partiotic song which is as well known as the Indian national anthem ? Who wrote this song ?

3 (a) Who is the present Defence Minister of India ? Who was the last Governor General of India ?

(b) Why is Kerala so much in the news today ?

(c) When was the last census taken in India ? How often is a census taken ?

(d) Where are the three new steel plants sanctioned by the Government of India being set up ?

(e) Name the three most important sources of revenue of the Government of India.

4 Name the following —

(a) The President of the U S A
(b) The Prime Minister of Great Britain.
(c) India s Ambassador to the U S S R
(d) The Prime Minister of Ghana
(e) The Queen of Netherlands
(f) The Governor of the Reserve Bank of India
(g) The President of the Indian National Congress
(h) The Speaker of the Lok Sabha
(i) The Governor of Uttar Pradesh
(j) The Minister for Railways in the Union Cabinet of India

5 Who or what are these ?—

(a) Mao Tse tung
(b) Kuala Lumpur
(c) Rolex (d) Namboodirpa
(e) Diefenbaker (f) Bulganin
(g) C K Nayudu
(h) Uday Shanker
(i) Ravi shankar (j) Shankar

6 What do the following abbreviat stand for ?—

(a) B O A C (b) F A.O
(c) I M F (d) S P C.A
(e) D V C. (f) R.A F
(g) F R.S (h) N C.O
(i) I O U (j) D L.O

7 Why are the following dates imp ant in the history of India ?—

(a) 327 B C (b) 711 A D
(c) 1526 A.D (d) 1556 A D
(e) 1615 A.D (f) 1707 A.D
(g) 1757 A D, (h) 1793 A D
(i) 1919 A D (j) 1950 A.D (2 Jan

8 (a) Name the principal coins of of the following countries —

(i) Ceylon (ii) U S.A.
(iii) Italy (iv) Netherlands
(v) West Germany

(b) Name the countries in Africa w have won their independence since 1947

ANSWERS

1 (a) The President is elected by members of an electoral college consisting

(i) the elected members of Houses of Parliament, and
(ii) the elected members of the Legislative Assemblies of the St

As far as practicable there shall be formity in the scale of representation o different States at the election of the Pres

(iii) 5 years

TATES

(b) 1 Andhra Pradesh 2 Assam
3 Bihar 4 Bombay
5 Jammu and Kashmir
6 Kerala
7 Madhya Pradesh
8 Madras 9 Mysore
10 Orissa 11 Punjab
12 Rajasthan
13 Uttar Pradesh
14 West Bengal

TERRITORIES

1 Andaman and Nicobar Islands
2 Delhi
3 Himachal Pradesh
4 Manipur 5 Tripura
6 Laccadive Minicoy & Admindivi Islands
7 The Naga Hills Tuensang Unit

2 (a) The National Flag is a tricolour with horizontal stripes—saffron (kesari) at the top white in the middle and dark green at the bottom The ratio of the width of the Flag to its length is two to three. The emblem on the Flag is an exact reproduction of the Dharma Chakra on the capital of Ashoka at Sarnath The Chakra is superimposed on the central band, and is as broad as the white strip It is dark blue and has 24 spokes

(b) (i) Ravindra Nath Tagore
(ii) Bande Matram
(iii) Bankim Chandra Chatterji

3 (a) (i) Krishna Menon
(ii) C Rajgopalachari

(b) It is the only state in India where there is communist Ministry

(c) (i) 1951 (ii) Every Ten Years
(d) Durgapur Rourkela Bhilai
(e) (i) Taxes as income (other than agricultural) tax estate duty etc
(ii) Tariffs (iii) Railways

4 (a) Dwight D Eisenhower
(b) Harold Macmillan
(c) K. P S Menon
(d) Dr Kwame Nkrumah
(e) Juliana
(f) H V.R. Iyengar
(g) U.N Dhebar
(h) Ananthasayanam Iyengar.
(i) V V Giri
(j) Jagjeewan Ram

5 (a) President of the People s Republic of China
(b) Capital of Malaya
(c) Rolex Watches
(d) Chief Minister of Kerala
(e) Prime Minister of Canada
(f) Chairman of the Council of Ministers of the U S S R (Prime Minister of U S S R.)
(g) Famous Indian cricket player
(h) Famous Indian dancer
(i) Famous Indian sitarist
(j) Famous Indian cartoonist.

6 (a) British Overseas Air Corporation
(b) Food & Agricultural Organisation
(c) International Monetary Fund
(d) Society for the Prevention of Cruelty to Animals
(e) Damodar Valley Corporation
(f) Royal Air Force
(g) Fellow of the Royal Society
(h) Non Commissioned Officer.
(i) I owe you
(j) Dead Letter Office

7 (a) Alexander invaded India
(b) Mohd bin Qasim invaded India
(c) First battle of Panipat between Babar and Ibrahim Lodhi
(d) Second battle of Panipat between Akbar and Hemu.
(e) Sir Thomas Roa come to India
(f) Death of Aurengzeb
(g) Battle of Plassey
(h) Permanent Settlement in Bengal
(i) The Montague Chelmsford Reforms India
(j) Inauguration of the Constitution of India

8 (a) (i) Ceylon=Rupee
(ii) U S A =Dollar
(iii) Italy=Lira
(iv) Netherlands=Florin
(v) West Germany=Mark

(b) (i) Gold Coast
(ii) Niasaland Rhodesia
(iii) Sudan
(iv) Morocco
(v) Tunisia.

STUDENTS AND THEIR DUTIES

"PATERNITY is a career which is imposed upon you without any enquiry for your fitness for it. Thus we see so many fathers who have children but few children who have fathers", thus spoke Socrates What ever truth was there in these utterances during his time we do not know, but in the middle of the twentieth century the truth of this ex pression is very much pronounced and will be evident if we pause to consider the growing unrest and indiscipline among the student community in general. To find the cause of it we have to go to the source namely their home-training It is the sacred duty of every parent to see that their children are trained and reared at home in a manner which will make them noble worthy and responsible citizens of their country Parent's lack of ability in properly guiding their children dearth of understanding and sympathy indiffer ence and negligence and the somnolent manner with which the children are brought up at home are some of the factors responsi ble for fostering a spirit of defiance in the impressionable minds of the students

But it would be unwise to put cent per cent blame on the shoulders of the parents alone If it is the sacred duty of the parents to create the most favourable environment for the optimum development of their children no less sacred is the duty of the students to guide themselves in proper channel and through congenial atmosphere Students must not forget that it is from among them that men of sufficient intelligence and culture should be found to guide the destinies of the nation and it is they who are the future leaders and moulders of our nation our hopes and aspira tions They must remember that it is from among them that leaders endowed with imagi nation, intelligence and courage will ultimate ly emerge and they should prepare themselves to play the roles in a befitting manner and should be conscious of the responsibilities that lie ahead

Students should act and behave like a stu dent with modesty and decorum and should not arrogate to themselves the role of a political leader and dictate their elders They should cultivate with the greatest zeal and steadi ness all the qualities that will make them noble worthy and responsible citizens of the country so that at the end of their life's career they should triumphantly say that they had burnt their fingers in the fires of life

Now a-days we are familiar with such words like student movement and student leadership What these words actually de note in free India I do not know But if it has got something to do with politics then the judicious course for the students is to stay away from such movement of leadership The real motto of students should be—"let us keep aside politics for our elders for the time being and let all our movements and leadership be a march towards cultural social intellectual and sports field If there are born leaders among the students or if students acquire the gift or leadership by dint of their power latent in them, verily they will get the chance to guide the destinies of their country in some capacity or other in future So why this haste? Will they allow, when they them selves will be the guardians their children to indulge in playing political games to the detri ment of their education? They should remain passive spectators and take all the events and happenings as mere incidents without showing any emotion Students should never allow themselves to be exploited and become cannon fodders of crafty politicians and political groups It will lead them to the path of ruination They should not behave like so many phantoms allowing the substance to stride behind They should remember that each one of them has to reckon with himself and not a soul will turn up to assist them in their plight. Not that they should always confine themselves within the pages of their books and do nothing On the contrary they should find time to indulge in intellectual pursuits, in holding friendly discourses among themselves in the inter-change of thoughts and ideas, in light recreations in playing sorts of indoor and out-door games, in

getting ready to be of some service however humble to somebody and in giving succour to all and sundry If students train themselves in such a manner and subject themselves to this sort of mental and physical discipline during their student days then only will they succeed in keeping their spirit afloat and they will neither fumble nor falter when they will be placed at the helm of the country s affairs But if students fritter away their energy in meddling with affairs which do not belong to them, and if instead of aiming to achieve all these sterling qualities during the short period of their student days they waste their precious time and energy at the behest of the willy politicians and defy their guardians they are sure to be disillusioned in the future The problem of all problems today is how to produce people of imagination intelligence, and courage Strange though it may seem in every country there is a downward trend in the intellectual and moral calibre of those who carry the responsibility of public affairs It is the students who as future leaders will have to arrest this deterioration and play their parts capably in public affairs Changes that will be produced in our environments by the example of the students will profoundly influence the future generations and it is high time that they should be conscious of their future generations and act accordingly They should know politicians and political groups are always out to exploit their emotions and sentiments They do not see the real game Things which are obscure now will become clear to them when they will cross their student days. They will find themselves then bewildered disillusioned baffled and frustrated So why the students would bother about things which belong to their elders Students should remember this wise counsel that—

> It is easy in this world to live after the world opinion it i easy in solitude to live after our own but the great man is he who in the midst of the crowd keeps with perfect sweetness the independence of solitude

So the students should maintain their independence of judgment and not be swayed by emotions and passions let loose by the impacts of outside events and red hot speeches of the professional politicians

* * *

FILMS HELP IN TEACHING

Two giants of the entertainment world films and television are just now in the process of developing interesting sidelines in the field of education

The initiative though has actually come from educators rather than entertainers For American educators are faced with the problem of accommodating a rapidly increasing school population and one that is spending more and more years in school

Now as in Aristotle s time it is generally conceded that the best way for young people to learn is through close personal association with a wise teacher Unfortunately in a world growing more crowded every day it is difficult to maintain an intimate pupil teacher relationship

To continue existing pupil teacher ratios in the face of ever-expanding enrolments would require a vast two-pronged programme of building new facilities and of teacher recruitment and training And many educators believe that even if the necessary funds for construction were available the second part of such a programme would prove infeasible

The alternative now being explored in a number of different ways is to exploit more fully the potentialities of modern tools of education such as television and films

A good deal of progress has already been made in this direction Teaching by means of closed circuit (wired) television for example has proved successful at Pennsylvania State University and in the high schools of Hagerstown, Maryland. And no less than 24 open-circuit (broadcast) stations are active in the field of education

Colleges in San Francisco and in Chicago are offering television courses in certain subjects for which academic credit may be earned and New York University will do likewise in September—to name only three of the many institutions exploring this field

The University of Detroit goes much further in an experiment in television teaching that begins formally this month It will offer for viewing on home television screens a complete first year college course of five subjects carrying credit toward a degree

In announcing this project the university noted that in another decade there will be twice as many qualified high school graduates seeking entrance to colleges as there are today And the university observed it will be impossible to find enough qualified teachers to handle such expanded college classes without seriously lowering the standards of instruction

The University of Detroit believes that standards of quality and requirements of

quantity can be handled effectively by the use of several tools of education one of them being television

The new television course will be on the air three hours daily Monday through Friday Students taking the course will go to the campus once or twice a week for individual conferences with faculty members and for group discussions and examinations

This is definitely an experimental project and the university has made it clear that a full four year television course is still a thing of the future But certainly the experience of the coming academic year in Detroit will be the basis for another step in that direction

Lectures in the Detroit course will presumably be live though there is no reason why they could not also be filmed for future use Television of course is well suited to the use of all manner of filmed 'educational tools although at present such films are designed primarily for the classroom

The use of motion pictures in teaching is of course not new the largest producer of educational films in the United States has been at it for 28 years But up to now such materials have been devoted exclusively to topics a class could not see otherwise demonstrations in the physical sciences requiring equipment and procedures too complicated for the classroom for example or visits to the people of far off lands

As one producer of educational films has put it ' Nothing can replace the teacher but there are some things a film can do that a teacher can t

Now however as a new departure a complete year s course in high school physics has been filmed Comprising 162 sessions this course is designed for use in areas where there is a shortage of trained physics teachers The film was made by Professor Harvey White noted physicist of the University of California

Similar projects in other fields are now under way and the time may not be far distant when students in even the most remote country schools can have as their teachers foremost scientists and scholars—on film

In the foreseeable future televised and filmed courses seem destined to play a more and more important part in American education Whether the supply of teachers will ever catch up the demand cannot be predicted now In any case for the time being these new educational tools are invaluable as 're placements for the teachers who aren t there

THE YOUTH HOSTEL MOVEMENT

The Youth Hostel Movement is about fifty years old and had its origin in Germany when Herr Richard Schirrmann opened th first in 1909

India is the first country in Asia to take up the Youth Hostel Movement There are nearly 100 Youth Hostels in India so far

The Ministry of Education and Scientific Research Government of India have made a provision of Rs 10 lakhs for the encouragement of the Youth Hostel Movement under the Second Five Year Plan

To assist the students to undertake educational and recreational tours a scheme has been included in the Youth Welfare Programme of the Government under which small and manageable batches of students—not more than 32 students and three teachers incharge—from an institution are eligible for financial assistance to the extent of 75 per cent of the railway/bus fare at students concession rate The scheme came into operation in 1955 56

During the current financial year grants amounting to Rs 67 921 have been sanctioned for 76 institutions up to October 24 1957 About 2 040 students and 191 teachers incharge will be benefited by these grants Total Plan provisiton for this programme is Rs 12 50 lakhs

HOMEWORK—A HOLDOVER ?

Can homework be justified unless it is a definite follow-up of clearly defined school work which can best be done at home ?

Much which goes under the guise of home work may be a holdover from the days when to keep busy was a virtue in itself Is it not better to have children doing careful guided study at school where their need for further information or special help can be met by a trained person ?

Some homework is simply a test of the adequacy or literacy of parents and actually creates a great deal of family tension rather than building a positive attitude toward work

Some homework is simply repetitious drill on material already presented Other types involve assignments which take children into new areas for which they have not been prepared

However there are homework tasks which are an extension of stimulation in class and which children follow up with great eagerness These tasks usually provide opportunities for children to become self directive Most schools have yet to do a really thoughtful job with this kind of homework

We need to look at the kinds of lives our children lead today and to consider whether book work in the evening is the best way to further their allround development

TRAINING IN MINING AND GEOLOGY

The Union Minister of Education and Scientific Research in a statement laid on the table of Rajya Sabha gave details of the institutions imparting training in mining and geology in India

Standard of course and subjects	*Number of institutions*	*Conferments*
1 Degree course in Mining Engineering	8	University degrees or degree awarded by the Indian Institute of Technology, Kharagpur
2 Diploma Course in Mining Engineering	10	Diplomas awarded by State Boards of Technical Education of similar authority
3 M Sc in Geology	23	University degrees or degree awarded by the Indian Institute of Technology Kharagpur

According to the statement following are the institutions which impart training in Mining and Geology in India —

The Indian School of Mines and Applied Geology which is one of the institutions included under 1 & 3 above also awards its own Associateship which in the case of Mining Engineering is recognised as equivalent to degree in Mining Engineering and in the case of Applied Geology as equivalent to M Sc in that subject

The students of the School can either appear for the examinations of the Bihar University (to which the School is affiliated) and obtain B.Sc (Mining Engineering /M Sc (Geology) degrees or appear for examinations held by the School itself for the award of Associateship All these Diplomas are recognised by the Indian Bureau of Mines

* * *

POST DOCTORATE RESEARCH FELLOWSHIPS

The National Research of Council of Canada will award during 1958 59 approximately 80 post-doctorate Fellowship for research/study in Chemistry Physics Biological Sciences Agriculture Geo-Physics Mining Mathematics Engineering etc

The Fellowships are tenable at the National Research Council Laboratories of Canadian Universities and Laboratories of the Canadian Departments of Agriculture and Mines and Technical Surveys for a period of one year in the initial stage which may be renewed for a second year in special cases

The value of fellowship is $ 3 700 (Rs 17 619 approx) for single fellows and $ 4 500 (Rs 21,429 approx) for male Fellows who are married In addition cost of travel both ways will also be provided

Candidates should not be more than 35 years of age and should possess a Ph D Dergree from a recognised University or expect to obtain such a degree before taking up the award Successful candidates must meet all Canadian immigration requirements

Full particulars regarding the Fellowships and the prescribed application forms can be obtained from the Awards Officer National Research Council Ottawa 2 or from the Chief Scientific Liaison Officer National Research Council of Canada Africa House Kingsway London W C 2 England

The applications should be forwarded direct to the National Research Council of Canada Ottawa so as to reach there by February 15 1958

* * *

POLISH GOVERNMENT FELLOWSHIPS

The Government of Poland have offered 10 Fellowships through UNESCO for specialised studies in the following scientific fields during 1958

Chemistry Electronics Mathematics Mining Engineering Ship-building Siderurgy and metallurgy and Electric Transmission

The number of Fellowships for Indian nationals is not fixed The Government of India are however recommending two or three names to UNESCO The value of each Fellowship is 2 400 Zlotys (Rs 480 app) p m with free lodging exemption from tuition fees and free medical attention

Candiddates should possess at least

class Master s degree in Chemistry or Mathematics or a second class Bachelor s degree in mining metallurgy naval architecture or electrical engineering Preference will be given to candidates who have at least three years teaching research or practical experience They should be ordinarily below 40 years

Only those candidates who are employed as teachers in universities colleges or comparable institutions of higher education or are employed and engaged in research work in recognised institutions and laboratories and are sponsored by their employers are eligible to apply

Further particulars and application forms can be obtained from the Central Ministry of Education and Scientific Research (Scholarships Division Section S 9)

The last date for receipt of applications in the Ministry through the sponsoring authorities is February 7, 1958

* * *

GUIDE TO CAREERS THE TEACHER (HIGH SCHOOL)

The last two or three years of study leading to the matriculation exmination is generally regarded as the High School stage The pre university level of education can be said to consist of three stages primary school stage from the age of six to ten or eleven years middle school stage from the age of ten or eleven to fourteen years and high school stage from fourteen to sixteen or seventeen years

A High School Teacher s Work is usually to teach students at the high school stage and not infrequently in middle school classes also Students are prepared not only for higher education but also for gainful careers Their physical as well as their intellectual development are concentrated upon During the past few years objectives and concepts of high school and secondary school education have undergone rapid changes and efforts are being made to enlarge the scope of high school and middle school teaching by diversification of subjects provision of vocational training courses and various types of educative recreational and other curricular activities This gives a teacher added scope for the exercise of imagination and initiative

The atmosphere of a high school is generally stimulating Usually, 20 to 25 hours of class room instruction is put in every week The classes consist of about 40 students each. The hours of work are regulated and there is for holidays, off-days and vacations Benefits and provident fund are provided in Government and aided schools Work is usually congenial and not too strenuous and there is leisure to take up interesting hobbies

To Qualify as a high school teacher a university degree with a teacher s training diploma or a degree from a recognised teachers training college is necessary The degree, generally known as B T B Ed, or L T can be obtained after a full time one year s course. The subjects of study consist of the principles and practice of education including school organisation, educational psychology and hygiene of the school child the educational system in India and educational experiments abroad, methods of teaching selected subjects and principles and techniques of social physical audio-visual and basic education The training also includes demonstrations in practical methods skills and techniques of teaching as well as practical school assignments

The Cost Of Training is Rs 75/ to Rs 120/ as tuition fee for the whole course Maintenance expenses vary from place to place and also according to the standard of living of each student There are nearly 90 training colleges in the country

Further Training leads to a degree of Master of Education Candidates who have passed the teacher s training examination of a recognised university and who possess at least three years training experience can seek admission to the examination for this degree The course of study comprises the following subjects —Philosophy and sociology of education advanced educational psychology, techniques of research in education educational statistics and two optional subjects

The duration of the M Ed course in most of the universities is of one year but there are universities where the duration is two years Tuition fees vary between Rs 120/ and Rs 200/ per year Attainment of the degree of Master of Education entitles a student to get himself registered for the Ph D course with a university About 10 training colleges provide facilities for courses leading to this degree

Personal qualities Necessary for a high school teacher are cheerfulness patience and a friendly temperament As pupils are to be guided and helped in their studies as well as in the formation of their character, a teacher has to be a man of high principle and character a man imbued with enthusiasm dedicated to his work An open and enquiring mind which constantly seeks to extend the borders of knowledge is necessary because pupils only respect

teachers who have proficiency in their subjects A sympathetic and patient approach to understand the diffictuties and problems of pupils is equally essential Those who have an irritable nature or conspicuous physical defects such as poor hearing nervous disorders or an impediment of speech are not suited for the profession

Entry Into The Profession is not by unifrom methods In government schools appointments are made by the appropriate officers of the Education Department or by a selection board Appointments in private schools are made by the managing committees or the governing bodies and in some States these may be subject to the approval of the Education Department In the schools run by Local Bodies (such as Ditrict Boards Munjcipal Committees etc) appointments are madeb y the Chairman or President of the Local Bodies generally on the advice of Executive officers or the selection committees of such bodies Post of teachers in the higher grades are filled by the Public Service Commssions

Openings for High School Teachers exist for both men and women in Schools run by Government Local Bodies Defence Services Railway Administrations and private organisations A number of posts are also available for teachers who have specialised in a particular subject such as domestic science physical training sciences crafts etc though the majority of teachers have to teach a number of subjects (two to three) to different classes at various levels

Salaries of teachers in Secondary Schools managed by different authorities differ a good deal but every State is examining the position of teachers salaries with a view to revising their scales of pay The scales of pay admissible to high school tenchers in government or aided schools in various States are from Rs 60 154—5/10—150/300

Prospects For Advancement to the posts of specialists in the fields of vocational guidance child psychology etc are bright for those who specialise in such subjects A teacher can also aspire to the post of a headmaster which carries additional responsibility and a higher scale of pay For successful teachers there are selected and better paid jobs in the Education Departments of the State Governments

For Further Information on training facilities available in your State you may contact —

(i) The Director of Public Instructions or Education of your State

(ii) The Employment Exchange nearest your home

Employment Outlook

Expansion of Secondary Education has been rapid during the past few years At present there are about 10 000 secondary schools but efforts are being made to expand the teaching facilities at the Central and the State levels by opening more schools to cater to the needs for the increased student population

Side by side with this quantitative expansion steps are being taken to improve the quality and standard of schools To man these schools nearly 120 000 additional teachers will have to be employed whereas only about 164 000 teachers are in employment at present out of whom nearly 44 per cent are untrained teachers Training facilit es are being expanded rapidly but mass training of such a teacher force will take a long time *Meanwhile there is such a shortage of trained teachers in the country particularly in small towns and rural areas that almost any person who satisfies the minimum qualifications can expect to find early employment*

SCHOLARSHIPS BY FRENCH GOVERNMENT

The Government of France have offered 11 scholarships for post graduate study or research in France during *1958 59*

The value of each scholarship, which is tenable for one or two years is 30 000 Francs (about Rs 340/) p m with exemption from tuition fees free medical service and cost of second class sea passage both ways

Candidates should possess at least a second class Master s degree in Arts Science Agriculture or Education or a second class Bachelor s degree in Engineering Medicine Technology or veterinary Science or a good degree or an equivalent diploma in Painting or Sculpture and a good knowledge of the French language both spoken and written They should be below 35 years of age

Only those candidates who are employed as teachers in Universities Colleges or Comparable Institutions of higher education or are employed and engaged in research work in recognised institutions or laboratories and who are sponsored by their employers are eligible to apply

Application forms and further details can

scientific technological education Important decisions arrived at by the team were that general education should be incorporated in the courses of study of universities that it should continue to be open for under graduates to specialize in a subject of their choice there should be courses specially designed for general education in each of the three fields of knowledge—humanities natural sciences and social sciences that the general education required a pattern of evaluation different from the prevailing external examination specially because of its objectives and the prevailing method of instruction by lectures should be supplemented by small discussion classes and seminars

* * *

REFORM IN EXAMINATION SYSTEM

Dr K.L Shrimali Minister of State in the Ministry of Education and Scientific Research in a statement laid on the table of the Rajya Sabha on December 16 1957 gave details of the scheme for setting up an Examination Unit as a pilot project to introduce reform in the present examination system The Minister was replying to a question by Shri Maheshwar Naik

Broad details of the scheme for setting up an Examination Unit which has been approved by the All India Council for Secondary Education are as follows —

Aims and objects The aims and obojects of the unit are

(i) To identify and clarify the purposes and gradually improve the effectiveness of teaching the various school subjects

(ii) To suggest adequate learning experiences for the different purposes and

(iii) To improve evaluation tools

General Features In co-operation with the Extention Services Centres of teachers training colleges and State Boards of Education the officers of the Unit will organise workshops and seminars of class room teachers and prepare evaluation materials These will be tried out in classes along with appropriate methods of teaching which will provide suitable learning experiences The rusults will be studied and the tests revised and made available both to schools and Boards of Examination

The pilot project of the Unit is expected to start functioning early in 1958

The pilot unit will be manned by five officers The full Unit which is expected to be developed in 1958 will have 15 officers and a Deputy Director (Examination)

* * *

RECOGNITION TO HINDI EXAMINATIONS

The Government of India have decided to give recognition to the Hindi examinations conducted by the various Hindi organisations in the country for purposes of employment under the Central Government on the following conditions

(a) The institution must draw up definite rules for the conduct of examinations which must be approved by the State and Central Government before the examinations conducted by the institutions are recognised. Inter state organisations can however send these rules and regulations directly to the Government of India for approval

(b) Both in the interests of efficiency and economy the number of examination centres should be as small as possible and there should be no centre for less than 10 students,

(c) The organisation seeking recognition whether of an all India character or otherwise should have at least 10 teaching centres of its own or 10 teaching centres should be affiliated to it

(d) The staff employed by these organisations for teaching work should be appropriately qualified

(e) The text books prescribed by the various organisations should generally conform to the model syllabus approved by the Government of India

(f) The viva voce test should from an essential part of all exmainations conducted by these organisations

(g) Each institution must have assets worth Rs 50 000/ exclusive of examination fees

(h) Recognition may be accorded on a permanent basis but Government of India will review every three years the work of each organisation and if it is found to be unsatisfactory recognition may be withdrawn

An application form has been prescribed for this purpose Institutions interested in getting their examinations recognised can obtain the forms from the Ministry of Education and Scientific Research Department of Education Hindi Division

Five copies of the completed application form must reach the Ministry by February 28 1958 On receipt of these applications Government will examine each case for recognition

* * *

REMEDY FOR LARGE FAILURES IN MATRIC EXAMINATION

The question of large failures in S L C or Matriculation Examination in 1957 as reported by different examining bodies and the setting up of an Examination Unit as a pilot project during the current financial year to effect reforms in the present examination system came up for discussion at the sixth meeting of the All India Council for Secondary Education held in Delhi on November 15 1957 Shri K G Saiyidain Educational Adviser to the Government of India and Chairman of the Council presided

The Council discussed at length the causes of failures in the S L C or Matriculation Examination and recommended the following measures to the Government

(i) State Governments should take early steps to remedy the situation arising from lack of accommodation inadequate equipment and unqualified and untrained teachers

(ii) State Boards of Secondary Education should examine the complaint about the heavy load in the syllabus and the means to be adopted for the proper handling of the syllabuses so that the emphasis may not be so much on the mastery of the subject matter as on the educational growth of the child It was also resolved to recommend to the State Boards that curriculum committees should be established for constantly evaluating the syllabi and wherever necessary making suitable modifications

(iii) State Boards of Education should also examine the possibility of making changes in the pattern of the examination on the lines recommended by the Examination Seminar at Bhopal and Examination Conference at New Delhi and should be urged to take early steps to implement them The suggestion that in each subject examination may be conducted at two levels—an ordinary and an advanced level—may also be examined by the State Boards

(iv) State Government should consider whether the jurisdiction of the Boards of Secondary Education could not be suitably limited so that no Board will have the responsibility of examining tens of thousands of candidates at a single public examination as at present

* * *

NO HASTY CHANGE OVER FROM ENGLISH

The University Grants Commission has accepted the main recommendations of the Report of the English Committee appointed in 1954 to examine the problem of medium of instruction at the University stage and recommend ways of securing adequate proficiency in English

The Committee recommends that :—

1 The change from English to an Indian language as the medium of instruction at the university stage should not be hastened

2 This change to be preceded by adequate preparation of the Indian language as a medium of expression for learned purposes and a sufficient body of learned literature in that language in all subjects of study

3 English should continue to be studied by all university students, even after the change

4 At the scondary school stage a proper foundation in English should be laid

5 The methods of teaching English at schools should be carefully examined to train teachers and make available to them and students the latest techniques in the study of foreign languages

6 It would be necessary to have text books prepared on scientific principles The Government of India or the Council of Secondary Education should take up this question for consideration

7 The aims of English teaching at the school stage should be defined Some arrangements should be made for those who propose to go up for university education to have additional emphasis laid on proficiency in English

8 In relation to the Three Year Degree Course which is now proposed to be introduced in our Universities the teaching of English to be given special attention in the pre university class

9 The teaching of English literature should be related to the study of Indian literatures so that it could be an effective means of stimulating critical

thinking and writing in Indian languages

10. The question of courses of study in English and methods of teaching English at the university stages be examined by an expert body and its recommendations be adopted by all the Universities

11. Where English is not the medium of instruction at any university course special methods to secure an adequate knowledge of English as a second language be adopted

12. Greater attention should be given to linguistics in our Universities and in our teacher training colleges

13. It is in our educational interest that English should be retained as a proper studied second language in our ... even when an Indian language is used as the ordinary medium of teaching

durance tests a distressingly large number of candidates from among those successful at the written examination have to be rejected This poses a problem for our educationists.

The tone of discipline, the level of academic achievement to be aimed at and the methods of promotion from lower classes to higher classes have all no doubt a bearing on the standard of education But it should be seriously examined whether the present educational system provides adequate facilities and opportunities for the enlargement of the mind and development of the character and personality of our students

So long as the system of education in schools and colleges does not serve this purpose adequately the personality tests whatever may be their perfections will have to play an important role in the selection of candidates for public services

The report reviewed the activities of the Commission from April 1 1956 to March 31, 1957

THINGS THEY SAY

Learning if rightly applied makes a young man *thinking attentive industrious confident*, and wary and an old man cheerful and useful. It is an ornament in prosperity a refuge in adversity and entertainment at all times it cheers in solitude and gives moderation and wisdom in all circumstances —*Palmer*

* * *

Weakness is the one cause of suffering We become miserable because we are weak. We lie steal kill and commit other crimes, because we are weak We suffer because we are weak. We die because we are weak Where there is nothing to weaken us there is no death nor sorrow —*Vivekananda*

* * *

The vulgar mind fancies that good judgment is implied chiefly in the capacity to censure and yet there is no judgment so exquisite as that which knows properly how to approve —*Simms*

REVISED RULES FOR STATE AWARDS

The Government of India has recently collated and published the Rules to regulate the grant of State Awards for films

All India feature documentary and children's films certified for public exhibition in the preceding calendar year will be eligible for entry

The feature films will be adjudged initially by three Regional Committees stationed at Bombay Calcutta and Madras whose recommendations will be reviewed by a Central Committee The documentary and children's films will be examined by the Central Committee

The Central Committee will consist of 12 persons and the Regional Committees of eight persons all nominated by the Government of India There will be three persons qualified to judge technical standard presentation direction and treatment values of films drawn from a panel of nominees representing the industry on each of the three Regional Committees as well as on the Central Committee In addition, there will be four distinguished persons of culture art or literature on each of these Committees nominated in consultation with the State Government concerned with the language.

Instituted in 1954 to encourage the production of films of high aesthetic and technical standard and of educational and cultural value, the State Awards for Film provide for the President's Gold Medal for the best feature and documentary films and President's Silver Medal for the best feature film in each Indian language The Prime Minister's Gold Medal has been earmarked for the best children's film. Certificates of merit are awarded to the second and third films in each of the categories mentioned above

The next Awards are likely to be made in March 1958 to assess the films certified for public exhibition in 1957

* * *

EXECUTIVE FOR FILMS PROPOSED

The Government of India propose to appoint a Films Commissioner as the head of the Film Institute and the Film Production Bureau which are being set up at an early date

Mr M D Bhat the present chairman of the Central Board of Film Censors, will be appointed as the first Films Commissioner An officer of the rank of Deputy Secretary to the Government of India will be appointed as the chairman of the Censor Board

At present there are the Film Censor Board, and the Films Division of the Ministry of Information and Broadcasting which looks after the production and distribution of documentary films and newsreels It is now proposed to establish a Film Institute to impart

training in various aspects of film production as cinematography, sound engineering direction and so on

In addition a Film Production Bureau is to be established to advise producers in respect of film scripts The Film Commissioner will be the directional head of the Film Institute and the Film Production Bureau He will also have administrative supervision over the office of the Central Board of Film Censors and maintain liaison with the film industry

In August 1957 the Union Minister for Information and Broadcasting Dr B. V Keskar had indicated that the withdrawal of the Cinematograph Bill 1956 which was introduced in the Rajya Sabha on December 10 1956 did not mean that all its provisions were being dropped

The Minister had also indicated that the plans for the Film Institute and the Production Bureau were being actively pursued

* * *

CENSOR CERTIFICATE FOR 10 YEARS

The Government of India will soon amend the Censorship Rules to extend the life of the censor certificate to ten years instead of five years as at present

The Government agreed to this change on a representation made by a deputation of the film industry in New Delhi Representatives of the industry pointed out that the Government was in favour of this change since the Cinematograph Bill which has been dropped contained a stipulation to this effect

* * *

VANCOUVER FILM FESTIVAL

India has been invited to participate in the Vancouver International Film Festival scheduled to be held from July 30 to August 3 1958

Features documentaries children s films experimental pictures and television short released since January 1 1956 will be eligible

The films may be either in 35 mm or 16-mm and may be subtitled in English otherwise should be accompanied by the script or synopsis The last date of entry is April 15 1958

All films selected for showing at the festival will be granted a Festival Certificate and those judged best in the different categories will be given trophies and plaques

HOLLYWOOD ' BLUE FILM SYNDICATE

A million dollar Hollywood vice syndicate producing and distributing obscene colour films throughout the world has been smashed by Los Angeles police The blue movies were sold for high prices to agents from London to Hong Kong and syndicated throughout America

The Los Angeles police vice squad chief said This group specialised in filming movies for the international trade and rented to Hollywood stars the type of film they would never make themselves

We ve been working on the case for months and recently arrested eight persons including Barbara Jean Elliot a striking red head who had a police record

Two red leather bound books containing the names addresses and telephone numbers of stage screen and television notables were found in Jean Elliot s penthouse

Two brothers expert cinematographers 'shot the films and their father processed them One man who supplied the cameras and lights was a member of Hollywood s Smut Incorporated a vice ring broken in 1952 He had been making 50 000 dollars a year for films according to police who seized eleven of the movies in his camera store

CHILDREN S FIRST THEATRE

Mr Nehru opened in Madras on December 7 1957 the children s first theatre in the country

The theatre is housed in a modern building where the State Assembly was functioning from 1952 to 1956

The Prime Minister hailed the decision of the Madras Government to convert the Assembly Hall into a children s theatre

He wanted the theatre to be used exclusively for children and said that its atmosphere should not be vitiated by conferences of grown ups

Mr Nehru asked municipalities corporations and other public institutions to inscribe this motto in their chambers Children should be given the first place in our thinking

SCIENCE & INVENTION

HIGH DENSITY OF MATTER IN INTERSTELLAR SPACE

Interplanetary space is not a vacuum. This has been proved experimentaly by means of artificial earth satellites, reported Doctor of Physics and Mathematics Yakov Albert to a symposium of physicists at the Academy of Sciences of the USSR. By available information, he said, cosmic space is filled with matter of a relatively high density; according to preliminary estimates every cubic centimetre contains several thousand gas particles.

Time has come, Albert continued, when we can not only advance hypotheses on the nature of interplanetary space but check them experimentally. Soviet scientists are using for this purpose new radiometric methods. This has made it possible to detect in the apogee of the second earth satellite, that is at the height of 1,500-1,700 kilometres, a concentration of negatively charged particles—electrons. There are reasons to assume that in the proximity of the Sun the density of interstellar matter increases. Soviet astrophysicists have carried out observations of the radio shading effect of the so-called crablike nebula, a very remote and powerful source of radio emanations. It has been established that the shading effect sets in long before the Sun comes between the nebula and the earth. This is explained by the fact that the path of the radio emanations coming from the nebula is obstructed not only by the Sun and its corona but also by the interstellar space with a high density of matter around the Sun.

The newly established fact of the high density of matter in interstellar space must bring about a revision of certain astro and geophysical hypotheses. One of the problems which awaits solution is that of penetration through such a dense medium of corpuscular solar radiation which are of a considerably lower density and have a comparatively low velocity (of the order of 1.5 to 2 thousand kilometres per second). It is believed that this medium is transparent to corpuscular streams because they predominantly consist of neutral uncharged particles. It is possible that it is these streams of neutral particles capable of penetrating the low (down to 100 kilometres) layers of the earth's atmosphere which are in part responsible for the appearance of northern lights.

* * * *

MECHANICAL BRAIN PLAYS CHESS

An electronic 'brain' or giant computing machine in the United States has been taught to play beginner's chess and is capable of sometimes beating human opponents. The machine is one which is used by mathematical physicists at the Los Alamos Scientific Laboratory of the University of California at Los Alamos, New Mexico.

When a chess game is being played the machine's opponent makes his move first. An operator records the move on punched type and feeds it in the machine. The information passes into groups of electronic "memory cells". The machine then gives its answer by indicating the next logical move on a teletype machine.

The games have a serious scientific purpose which is to provide scientists with experience in handling certain types of problems and to test the capabilities of the computer in handling logical problems.

SHOE MOULDED TO FOOT

For the first time in the United States it will soon be possible to buy a perfectly fitted shoe. A shoe that literally is moulded to the foot was patented recently.

The new shoe has a special inner lining called a sock lining. After the shoe is put on the foot, a moulding material of liquid latex mixed with zinc oxide and wood flour is inserted through the shoe filling up all the space between the shoe proper and the sock lining. The material is injected at a comfortable body temperature.

NEW DRUG FOR HIGH BLOOD PRESSURE

Hypertension, America's most common form of cardio vascular disease, may be on the way out because of a new drug. The drug that is expected to be in full production early in

1958 and which has been termed "startling in combatting high blood pressure is called chlorothiazide It was discovered by two doctors at Massachusetts General Hospital in Boston It can be taken by mouth in tablet form and according to medical authorities has no bad side effects Between 15 and 20 mil lion Americans suffer from hypertension

* * *

ATOM MAY HEAT HOMES OF FUTURE

Private homes of the future may have nuclear reactors in their basements where they now have furnaces it was predicted recently by three nuclear chemical engineers of Alco Products Inc in the United States These reactors would not only supply heat in winter but would also provide power for air condition ing electric lights and electric home appliances

Dr A. Louis Medin head of Alco s nuclear technology division, said that the programme now under way in the United States to im prove reactor technology would reduce present high costs

* * *

SOLAR FURNACE PRODUCES GREAT HEAT

A new solar furnace that concentrates the sun s rays to produce temperatures nearly two-thirds as hot as the sun s surface was demons trated recently by the United States National Bureau of Standards in Washington

Studies with the solar furnace will be aimed at cracking the so-called thermal barrier the extremely high temperatures which cause the breakdown of all metals and alloys now known Such intense heat occurs in jet engines atomic reactors and will occur when future planes fly through thin air at supersonic speeds

The instrument consists of a large flat mirror which follows the sun across the sky reflecting its rays to the concave surface of a parabolic mirror This mirror concentrates all of the solar energy reflected on it into a single spot about one fourth of an inch in diameter

* * *

' RAIN DISPERSING IN NORWAY

Rain making experiments are in the news these days with the application of science to the problems of developing arid lands But in Norway the problem is exactly the reverse frequent heavy rains in the coastal areas do damage to crops and scientists have been try ing to find a means of reducing rainfall in these regions

Recent experiments consisting of spraying the clouds with silver iodide have proved successful in preventing the humidity from condensing into raindrops for long enough for the winds to blow the clouds elsewhere

According to Professor Einar Hoiland of Oslo University who is conducting these trials the method should have the added advantage that clouds dispersed in this way would finally gather and shed their rain over the mountainous regions inland This in turn would supply more water to the hydroelectric stations and produce more power for the country s economy

* * *

PHOTOGRAPHING THE SUN

Some of the best photographs of the sun ever taken dropped out of the sky a month or so ago into a field in Wisconsin U.S A They were taken at a height of about 80 000 feet, above most of the earth s turbulent at-mosphere by a camera attached to an unman ned balloon A 12 inch telescope was kept trained on the sun by automatic equipment while the camera snapped 8 000 pictures When all the film was exposed telescope and camera were automatically detached from the balloon and parachuted to the ground

According to Martin Schwarzchild Prince-ton University astronomer who is directing the project some of the pictures obtained in this way show details of the sun never seen before Chief among these are eddying gas storm ranging from 200 to 600 miles in dia meter that originate deep in the sun s atmos phere

* * *

THIS GROWING UNIVERSE

As man s dream of piercing the outer spaces seems on the verge of being realised a group of astronomers has thrown up the idea that perhaps the universe is growing big ger expanding at a uniform rate in all direc tions from a common centre

The astronomers base their conclusion on what they describe as substantial new evid ence after 20 years of cooperative study at the Mount Wilson Palomar and Lick observatories in the United States

Their report published in a leading as tronomical journal does not resolve the contro-versy about estimates of the greatest distances in the universe These were of the order of 2 000 million light years but from the evidence now available the distance scale may be off by as much as 30 per cent

A light year is the distance light travels in a year at the rate of 186,300 miles a second —thus one light year is nearly 6 billion miles

SCIENCE AND INVENTION

HIGH DENSITY OF MATTER IN INTERSTELLAR SPACE

Interplanetary space is not a vacuum. This has been proved experimentally by means of artificial earth satellites, reported Doctor of Physics and Mathematics Yakov Albert to a symposium of physicists at the Academy of Sciences of the USSR. By available information, he said, cosmic space is filled with matter of a relatively high density; according to preliminary estimates every cubic centimetre contains several thousand gas particles.

Time has come, Albert continued, when we can not only advance hypotheses on the nature of interplanetary space but check them experimentally. Soviet scientists are using for this purpose new radio engine methods. This has made it possible to detect in the apogee of the second earth satellite, that is at the height of 1,500–1,700 kilometres, a concentration of negatively charged particles—electrons. There are reasons to assume that in the proximity of the Sun the density of interstellar matter increases. Soviet astrophysicists have carried out observations of the radio shading effect of the so-called crablike nebula, a very remote and powerful source of radio emanations. It has been established that the shading effect sets in long before the Sun comes between the nebula and the earth. This is explained by the fact that the path of the radio emanations coming from the nebula is obstructed not only by the Sun and its corona but also by the interstellar space with a high density of matter around the Sun.

The newly established fact of the high density of matter in interstellar space must bring about a revision of certain astro and geophysical hypotheses. One of the problems which awaits solution is that of penetration through such a dense medium of corpuscular solar radiation which are of a considerably lower density and have a comparatively low velocity (of the order of 1.5 to 2 thousand kilometres per second). It is believed that this medium is transparent to corpuscular streams because they predominantly consist of neutral uncharged particles. It is possible that it is these streams of neutral particles capable of penetrating the low (down to 100 kilometres) layers of the earth's atmosphere which are in part responsible for the appearance of the northern lights.

MECHANICAL BRAIN PLAYS CHESS

An electronic "brain"—a giant computing machine in the United States has been taught to play beginner's chess and is capable of occasionally beating human opponents. The machine is one which is used by mathematical physicists at the Los Alamos Scientific Laboratory of the University of California at Los Alamos, New Mexico.

When a chess game is being played, the machine's opponent makes his move first. An operator records the move on punched tape and feeds it in the machine. The information passes into groups of electronic "memory cells". The machine then gives its answer by indicating the next logical move on a teletype machine.

The games have a serious scientific purpose which is to provide scientists with experience in handling certain types of problems and to test the capabilities of the computer in handling logical problems.

FLIGHT TO MOON WITHIN 10 YEARS

Flights to the Moon will become possible within the next decade Professor Yuri Pobedonostsev believes He writes in the Yunost magazine that substantiated projects of flights to the Moon and even to planets of the solar system are already in existence and that Soviet scientists are rapidly bringing this age-old dream of mankind into the realm of the possible

In a few weeks science has learned more about cosmic space than in the whole of the preceding history of mankind he writes The two Soviet Sputniks have already yielded a wealth of information

Does the temperature in upper atmosphere really exceed 1 000 degrees ? Why does the compass become erratic at great heights ? What is terrestrial magnetism ? Artificial earth satellites will help to reply to these and many other questions

The future Sputniks will make it possible among other things to study the surface of other planets the mysterious Martian canals the clouds on Venus the giant Jupiter and Saturn Solar observations will make it possible to verify the hypothesis that the main source of light is not the star proper but its usually invisible corona Astrophysicists will penetrate the secrets of the superhot and exploding stars determine the composition of the atmosphere on other planets and solve the problem which has agitated mankind for so long Is life possible on them ?

VERBAL REPORT FROM SPACE

We now know that living beings can withstand the so-called dynamic blow during the launching of multistage rockets and the lengthy effect of growing speed while the Sputnik enters into its orbit This has been strikingly proved by the experiment with the dog Laika said Professor of Medicine Petr Alekhin in an interview

The Professor pointed out that the Soviet scientists mastered the methods of medical and biological research in the cosmos and designed very light and portable instruments

Future experiments said Professor Alekhin will yield still wider results and the day is not distant when the voice of man will be heard from cosmos for the first time This first report by a space pilot will be the key to a solution of the problem of interplanetary travel

NEW TECHNIQUE PRESERVES BLOOD INDEFINITELY

Whole blood may now be kept indefinitely because of a new deep-freeze technique Blood is sprayed onto liquid nitrogen and is frozen so quickly that salt in the blood cannot cause a harmful chemical reaction on the red blood cells

A new portable refrigerator maintains the minus 320 Fahrenheit temperature for 23 days with a single charge of liquid nitrogen The blood is quickly thawed and reconstituted when needed According to the inventor of the technique Dr Harold P Merryman of the U.S Naval Research Institute in Washington, D.C. "it is as fresh as the day it was donated

• HEART MACHINE •

A machine which can detect the most obscure movements of the heart and which doctors hope will permit the early discovery of heart disease is in operation at the Charleston (South Carolina) Medical School Hospital

The machine was invented by Dr Dale Groom of the Medical School and Mr Yrjo Sivonen of the General Motors Corporation Research Centre at Warren (Michigan) and is based on the same principle as the devices which measure the compression of automobile engines It is capable of recording heart murmurs which until now had been inaudible with even the most sensitive machines The new device is so sensitive that it can detect the sound of blood circulating through the body

A part of the machine resembling the end of an ordinary stethoscope is placed on a patient's skin which acts as an electrode for heart signals The signals are reproduced on an oscilloscope where they can be photographed or recorded on a graph

CANCER KILLING ANTI BODIES

Dr Jonas Salk the American scientist who developed the Salk infantile paralysis vaccine has reported producing anti bodies in laboratory tests which will kill cancerous as well as healthy body cells

Dr Salk writing in the *Journal Science* described experiments which may provide a new key in the search for a cancer cure

Scientists have been searching for an anti body—the body's disease killers—which will attack only cancerous cells

A leading medical research worker was

quoted as saying that Dr Salk s discoveries would permit ' undreamed of approaches not only to cancer problems but also to the causes of multiple sclerosis rheumatic fever rheu matoid arthritis and some kidney diseases

Commenting on the discovery *The New York Times* reported 'The studies revealed a complicated set of relationships between normal cancerous tissues and the anti bodies or disease killers that the cancer may stimulate in the body Possibly it was suggested all cancerous growths have a common ability (antigen) to stimulate the production of disease fighting anti bodies as has been indicat ed in some test tube experiments

Dr Salk revealed that his experiments were an offshoot of his research for the infantile paralysis vaccine

Dr Salk also told of a new colour test to measure the number of anti bodies in the blood which he expected to lead to a greater understanding of such mysteries as mutation and heredity

ARTIFICIAL HEART

An artificial heart has been successfully used in Russia for an operation on an 11 year old boy according to a Moscow Radio broad cast on December 2 1957

Dr Mihail Ananiev Director of the Scientific Research Institute of Experimental and Surgical Apparatus said in an interview that an electronically-controlled artificial heart and artificial lung has been created in his institute

This apparatus was twice used on a patient for the first time in the Soviet Union by Prof Aleksandrovich Vishenvsky a promi nent surgeon for an operation inside the heart he said

The patient a boy of 11 had hereditary disease of the heart he added and children did not usually survive this kind of heart disease

Dr Ananiev said the apparatus which imitates the movements of a real heart and works either automatically or by hand could be used for revival.

If this apparatus is used on a person who has just died it is possible within certain limitations to revive the organism 15 minutes after death he said

But he added Unfortunately in clinical practice, this succeeds very rarely as practically it is impossible in so short a time to connect the apparatus to a person who has just died

ATOMIC LIGHT

The atomic age came to Moorpark (Cali fornia) on November 12 1957 when for five minutes the community of 1 500 was lighted entirely by means of nuclear power

The power came from a nuclear plant for generating electricity in the Santa Susana Mountains 30 miles north we t of Los Angeles Engineers said that it marked the first time an entire town was lighted in this manner

* * *

INTELLIGENCE CAUSED BY RADIO ACTIVITY

A British psychiatrist said in London that tests on 5 000 British school children born since 1945 have shown them to have intelli gence far beyond their years

Dr Ford Thomson who holds degrees in medicine psychology and physics said he believes that Strontium 90 and other radio-active substances may be the cause

Dr Thomson who is consultant psychia trist to the Wolverhampton Education Autho-rity was helped in his research by university professors and education authorities

The result was wonderful he said In the last 90 we tested' in the age group seven to nine 26 had an intelligence quotient of 140 which is recognised as near genius

And it wasn t just the odd bright one he said The whole lot—including the dull ones—are brighter

I believe Strontium 90 and other radio-active materials that did not exist before the explosion of the atomic bomb in 1945 may be responsible he said

Dr Thomson said the children would have absorbed the radioactive materials which are in all our food and all our drink '

He said the increase in radioactivity would affect the children when they were very young —up to about 18 months At that time it probably speeded up their mental processes he said

But Dr Thomson warned that while a small quantity of radioactive material may be good for a child too much would be dan gerous.

PEOPLE IN THE NEWS

The Rt Hon Harold Macmillan

The first British Prime Minister to visit India the Rt Hon Harold Macmillan arrived in Delhi on January 8 for a five-day visit. Mr Macmillan became Prime Minister of the United Kingdom in January 1957 after the resignation of Sir Anthony Eden. During the previous 12 months Mr Macmillan had been Chancellor of the Exchequer and had experience of three other senior offices in the Government since the return of the Conservative Party to power in the autumn of 1951. He had been successively Minister of Housing and Local Government, Minister of Defence and Secretary of State for Foreign Affairs.

Dr Harold Macmillan

Member of Parliament for Bromley (Kent) Harold Macmillan is a grandson of the founder of the well known publishing firm of which he himself when not a Minister of the Crown, has been joint managing director. Son of a Scottish father and an American mother he was born in 1894 went as a scholar to Eton and as an exhibitioner to Balliol College, Oxford where he took a first class in Moderations.

During World War I he served in the Grenadier Guards and was wounded three times. In 1919 he went to Canada as A D C. to the Duke of Devonshire the Governor General and in the next year married the Duke's daughter Lady Dorothy Cavendish. They have one son now M.P. for Halifax and three daughters.

After contesting Stockton-on-Tees unsuccessfully as a Parliamentary candidate in 1923 Mr Macmillan won the seat next year lost it in 1929 won it back in 1938 and then represented the constituency continuously until 1945. From the first he took an active part in discussions on social reform and under the pre war National Government was one of a group of Conservatives—the Northern Group—who were actively concerned with a constructive approach to social and economic questions.

Mr Macmillan was an outspoken critic of the National Government's foreign policy. When sanctions against Italy were abandoned in 1936 he voted against the Government and afterwards renounced the Government whip. He accepted the whip again a year later but did not allow this to fetter him unduly. In November 1938 he again voted against the Government—with Winston Churchill—when it refused to set up a Ministry of Supply. When in 1940 Churchill formed his National Coalition Government he appointed Mr Macmillan to the ministry of Supply as Parliamentary Secretary. In 1942 Mr Macmillan moved to the Colonial Office as Under Secretary of State. In the same year he was appointed a Privy Councillor.

When the Allied forces landed in Algeria a new ministerial post that of British Resident Minister at Allied Headquarters in North West Africa was created and Harold Macmillan went out in that capacity at the end of 1942

He was present when General senhower signed the Italian armistice and accompanied the Allied Headquarters from North Africa to Italy In Novmber 1943 he was appointed in addition to his ministerial post British Representative on the Advisory Council for Italy, with the title of United Kingdom High Commissioner In December 1944 Mr Macmillan went to Greece on another difficult mission — to mediate between the parties in the Civil war

Mr Macmillan returned to England in 1945 to be appointed Secretary of State for Air in the caretaker Government a month before the general election He lost his seat at the election but won a by-election at Bromely in November of the same year and represented that constituency e er since

Until he took office in 1951 Mr Macmillan was a member of the United Europe Movement s International Council and chairman of its Central and Eastern European Commission In 1949 1950 and in the f rst 1951 session he was one of Britain s representatives to the Consultative Assembly of the council of Europe

As Foreign Secretary in 1955 he attended the summit conference of the heads of government and Foreign Ministers of France the United Kingdom the United States and the U.S S R held at Geneva in July 1955 and the subsequent conference of the four Foreign Ministers at Geneva in October Before these meetings he visited the United States for consultations with other Foreign Ministers and attended the United Nations 10th anniversary celebrations at San Francisco

Following his appointment as Chancellor of the Exchequer in December 1955 Mr Macmillan succeeded Mr R.A Butler the previous Chancellor as Chairman of the Council of the Organization for European Economic Co-operation. During 1957 he visited Paris Bonn Bermuda and Washington (for talks with President Eisenhower) and Ottawa

In June July 1957 Mr Macmillan presided in London over the Conference of Commonwealth Prime Ministers the first to be held since he had taken office

* * *

Lady Dorothy Macmillan

Lady Dorothy Macmillan wife of Prime Minister Harold Macmillan is the third daughter of the 9th Duke of Devonshire She was born on July 28 1900 and spent her early childhood partly in Lancashire and in London (her father was a Member of Parliament before he succeeded to his title) and later partly at Lismore Castle Waterford her family s Irish estate and Chatsworth the Derbyshire seat of the Dukes of Devonshire When she was 16, her father was appointed Governor General of Canada

It was while living in Canada that Lady Dorothy became engaged to Mr Harold Macmillan, who was posted to Ottawa as A D C to the Governor General They were married in London in 1920

Lady Dorothy has many non political interests particularly child welfare She is a member of the Central Executive Committee of the National Society for the Prevention of Cruelty to Children and the Executive Committee of the East Sussex District Nursing Association

The Macmillans have four children a son and three daughters The son Maurice is M P for Halifax the daughters are married one of them to Mr Julian Amery M P Parliamentary Under Secretary of State and Financial Secretary to the War Office

* * *

The Rt Hon Sir Norman Brook

Sir Norman Brook, who accompanied the British Prime Minister on his Eastern tour is Secretary of the British Cabinet and has been Joint Permanent Secretary to the Treasury since the autumn of 1956 when on the retirement of Lord Bridges the office of Permanent Secretary was divided into two He is the official head of the Home Civil Service

Sir Norman has been Secretary of the Cabinet since 1947 an appointment in which he also succeeded Lord Bridges to whom he had served as deputy for several years

Norman Brook was born on April 29 1902 and educated at Wolverhampton School and Wadham College Oxford He joined the Home Office in 1925 As Principal Private Secretary to Sir John Anderson (now Lord Waverley) he played an important part in organizing Britain s civil defence both before and during the early years of World War II

In April 1942 he began his first spell of service in the Cabinet Office being appointed Deputy Secretary (Civil) to the War Cabinet Later he became Permanent Secretary at the Ministry of Reconstruction—civil-service head of an important Government department—at the early age of 41

Early in 1945 he returned to the Cabinet Office as Additional Secretary He began to take part in international affairs to Potsdam as secretary of the British

Late in the night of Augus 16 Sukarno and Hatta returned to Jakarta

On the morning of August 17 1945 after much discussion Sukarno read the declaration of independence and the formation of a Republic to a small group outside his residence Later it was broadcast over Domei Indonesia radio by its Indonesian employees behind locked doors The Independence Preparatory Committee elected Sukarno and Hatta as President and Vice President respectively on August 18 Sukarno and Hatta made public speeches in Jakarta on the 19th despite the picketing by the Japanese Army

The Allied troops spearheaded by the British began to land at Jakarta on September 29 And under cover of British cruisers Dutch contingents also began to arrive However the restoration of law and order remained in the hands of the British The conviction of the Indonesians that they would again revert to the colonial status was reinforced Consequently bitter fighting raged throughout most of Java Sumatra and Bali during November and December 1945 The heaviest fighting occurred in Surabaya which was a turning point in the struggle for Indonesian independence Except for a few periods of truce the first four years of the Republic s life were dominated by warfare against powerful enemies

The British Occupation Forces withdrew by the end of November 1946 The Dutch army was there and took over civil and military authority from the British but they were not in sufficient strength to have any authority over the far flung 4 000 island Indonesian archipelago On July 20 1947 Prime Minister Beel of Holland ordered the Dutch army to launch an all-out attack to crush the Republic Within two weeks the Dutch had cut deep into the Republican territory Though Britain and the U.S.A had extended de facto recognition to the Republic they took no effective action to check any Dutch aggression. It was at the instance of India and Australia that the United Nations intervened

The Security Council passed a simple resolution on August 4 1947 calling for cessation of hostilities and settlement of the dispute by peaceful means As a result of the U N Committee of Good Offices the two parties signed the Renville Agreement on January 17 1948 which made a temporary truce between the two adversaries

Negotiations for final settlement between the Republic and the Dutch finally broke down on December 11 1948 On December 18 in utter disregard of the Renville Agreement Holland launched its second aggression on the Republic Paratroopers occupied Jakarta President Sukarno and six Cabinet Ministers including Hatta and Sjahrir were arrested and taken to Sumatra Within two weeks almost all Java and Sumatra were in the hands of the Dutch The U N was presented with a *fait accompli* Although the Security Council passed a cease-fire resolution on December 24, the Dutch ignored it and continued fighting until December 31, 1948 in Java and January 5 1949 in Sumatra.

The second Dutch aggression was too much for Asian nationalism and solidarity At the initiative of Prime Minister Nehru the first Asian Conference was convened at Delhi On January 23, 1949 it unanimously passed a resolution urging release of all political prisoners freedom for the Republic to function freely formation of an Interim Government consisting of the Republican and the non-Republican areas by March 15 1949 enjoying full sovereignty elections for a Consembly to be completed by October 1 1949 power over the whole of Indonesia to be completely transferred to the United States of Indonesia by January 1 1950 relation with Holland to be settled by negotiations between the parties and finally in the event of either disputants not complying with the recommendations of the Security Council the latter must take effective action for their enforcement. The Security Council could not overlook the demands of the Asian Conference On January 28 1949 it passed an identical resolution. The Committee of Good Offices was renamed U N Commission

During detention Sukarno and six Cabinet Ministers remained prisoners firstly in a mountain resort in Sumatra and then in the Island of Bangka They were offered freedom to move if they signed a pledge to refrain from political activities! Sukarno and others were given one room 20 feet square with beds wired off like zoo cages Sukarno and the party returned to Jogjakarta on July 6, 1949 after about seven months of imprisonment War was officially ended on the night of August 10, in Java and on August 14 1949 in Sumatra On December 27, 1949 the Indonesians took over all civil and military administration from the Dutch Thus the revolution was brought to fruition and also ended the third phase of Sukarno s eventful life On August 17, 1950 the sovereign Republic of Indonesia came into being with a unitary form of government, and with Sukarno as its first elected President.

Mr Viliam Siroky

Mr Viliam Siroky, Prime Minister of Cezchoslovakia who arrived in Delhi on January 3, was born on May 31, 1902 in Bratislava He is the son of a railway worker At the age of 15, he became a railway worker himself He joined the Social Democratic Party contributed to various socialist journals and became a supporter of the revolutionary Left wing One of the founders of the Communist Party organization in Bratislava he was elected to Parliament in 1935

With the coming into power of the Hitlerite regime in Germany, Mr Siroky took an active part in strengthening the People s Front against Fascism and for the defence of the Republic

He went abroad to organize the liberation struggle Till 1940 he worked in Paris then left for Moscow In 1941, after the arrest of the leaders of the resistance movement in Slovakia he returned to Slovakia and worked against the Nazi occupation of his country In July he was arrested by the Gestapo and imprisoned

Together with Julius Duris the present Minister of Finance he escaped from prison in 1945 and the same year he was appointed Deputy Prime Minister in the first Government at Kosice and held office till 1953 He was also Minister of Foreign Affairs from 1950 to 1953

In March 1953 after the election of Mr Antonin Zapotocky as President Mr Siroky became Pime Minister He is also a member of the Political Bureau of the Central Committee of the Communist Party of Czechoslovakia and the Chairman of the Central Committee of the National Front

Mr Halldor Kiljan Laxness

At the invitation of the Government of India Mr Halldor K Laxness an Icelandic Writer and Nobel Prize Laureate accompanied by his wife and a Secretary is visiting India from January 8 to 30 1958

Halldor Kiljan Laxness was born on April 23 1902 in Reykjavik the capital of Iceland His parents moved away from town when he was three years old and bought a farm about 15 miles from Reykjavik. He therefore grew up on a farm among the wild mountains of Iceland among animals and the pleasant country folk of Iceland

Though his parents were of modest means there was a high culture milieu He had access to many books in Icelandic and English

The father played a violin for his own pleasure and that of the people on the farm and gave his children interest in music A daughter is a well known pianist Halldor Laxness plays the Piano especially Bach with talent

When Laxness was 15 years old he was sent to the Gymnasium in Reykjavik He had already read an incredible number of books on the most varied subjects and was filled with the stories of his grandmother about strange fates and magic and ghosts

Already he had begun publishing poems in the papers and when he was 17, his first novel was published Then he went abroad and travelled over most of Europe wrote a number of short stories and a novel

When he was 20 he entered a monastery in Luxemburg as a guest and spent nearly a year there in religious studies Catholicism seemed to fascinate and repel him at the same time and he left the monastery

For another year he steeped himself in Indian philosophy but in his frantic search for a religious conviction he later joined a monastery in England for a short time

This period found its artistic expression in the great novel The Great Weaver from Kashmir which was influenced by the surrealistic movement in France It created a great stir in Iceland where some critics hailed him as a genius and a coming man in Icelandic letters

After that Laxness left Iceland for the United States and Canada where he spent three years He came back home in 1929 settled down in Reykjavik and got married

His globetrotting days were however not over and the next books were written in hotel rooms in Barcelona Moscow and Buenos Aires

Among these were Salka Valka the story of a fishing girl in a mean little village The next book was Independent People the story of a farmer who was ready to sacrifice all to become independent, told with humour and exaggeration so that some of the farmers in Iceland protested strongly against it Laxness s followers however pointed out that he had not written a guide-book of Iceland but an epic novel where the life of the Icelandic farmers for a thousand years was compressed into the lifespan of one farmer

In the years 1937-40 the ' Light of the World was published This treats the life story of a poet People had now become used to his stern humour and severe criticism and,

whereas his earlier books had always raised a storm of protest this was acclaimed at once as a great production by everybody

The next work 'The Bell of Iceland' is laid in the 17th and 18th centuries and has as its theme the travesty of justice and economic exploitation of the Danes in Iceland.

In 1953 'Gerpla' was published This novel takes place nearly 1 000 years ago and is about two poets who wanted to live the heroic life after the Viking time had passed and the Vikings had turned into peaceful farmers. One of the poets had composed a great poem about a king of Norway without ever having met him When at last he stood before him reality was so far from romance that he forgot his great poem

The last of his books Brekkukotsannal — the story of the Cottage at Brekka—was published in 1957 This again has a new subject It is the story of a singer who could not sing as seen through the eyes of a half-grown boy Though it is a tragic story it is full of humour The difference is that whereas his former books had a stern severe humour this one is full of gracious laughter

Apart from the great epics he has written several minor works and published some plays that have been performed at home and abroad.

He is far to the left in politics and writes extensively in the left wing press of Iceland on all subjects under the sun and often with a rather biting point. Some of these articles have been collected as several volumes of essays

In spite of his globe trotting Mr Laxness takes an active part in the social life of Iceland always ready to give his name and time to assist a good cause or help a friend He is one of the directors of the National Theatre and a director of several book clubs and cultural societies

He was married again 12 years ago and has now two little fair-haired daughters of 9 and 6 years called S[illegible] and Guday He has built himself a new house on a part of the farm wh[illegible] he grew up There he entertains his many friends and [illegible] in a grand and gracious manner His musical [illegible] which he however refuses to play [illegible] himself are a much [illegible] feature of the social life in Reykjavik

Laxness won the Noble Prize for Literature for the year 1955

Foreign Events

Sir Hillary Reaches South Pole

Sir Edmund Hillary joint conqueror of Mount Everest with Tensing reached the South Pole on January 3 the first man to get there by the overland route since Capt Robert Scott s ill fated expedition in 1912

Hillary leading the New Zealand trans Antarctic expedition radioed the news of his success to the Ross Sea Committee orga nizers of the expedition at 10-01 a m (G M T)

An American research outpost already at the Pole after being landed by air gave a warm welcome to Hillary and his four com panions after their 1 200 mile journey across dangerous snow and ice since they left Scott Base with their tractors and dog teams

The rugged New Zealander arrived at the Pole in the same month as Capt Scott 46 years ago Capt Scott reached the Pole on January 12 1912 with four companions only to find that Amundsen of Norway had about a month earlier become the first man to reach the bot tom of the world

Capt Scott who perished in a blizzard on the return journey used sleighs pulled by ponies and dogs after experiments with motor sledges proved unsatisfactory He set out from Ross Island in November 1911

By contrast Hillary accomplished his feat with the aid of snow tractors sledge and dog teams But he took longer because when he set out in October 1957 he did not intend to go to the Pole at all His aim was to put down supply depots and find a route for a British party crossing from the other side of the continent Hillary s journey from Scott Base to the Pole covered a distance of almost 1200 miles

Sir Edmund and four other New Zealanders are the third group of explorers in history to reach the Pole over land and the first in 46 years Intervening visitors to the bottom of the world had gone by air

Sir Edmund s companions were Mr Murray Ellis Mr Peter Mulgrew Mr Jim Bates and Mr Derek Wright

Agitation in Nepal

The Nepalese Government announced on Sept 30 that the country s first general elec tions which had been fixed for October 8 would be postponed indefinitely as the previous Government had neglected to obtain ballot-boxes paper for the electoral rolls and other necessities The Democratic Front (the alli ance formed by the three leading Opposition parties) subsequently decided on October 10 to launch a nation wide civil disobedience cam paign as from December 8 to secure early elections it also demanded the appointment of an independent and impartial electoral com mission to make preparations for such elec tions

King Mahendra announced on November 14 that he had accepted the resignation of the Prime Minister Dr K.I Singh and would himself take over the administration for the present Dr Singh Chairman of the United Democratic Party became Premier on July 26, 1957 He formed a coalition Cabinet with in dependents Although no official reason was given for Dr Singh s sudden resignation it was generally believed to be connected with a purge of corruption in the Civil Service during which he had appointed his own nomi nees to senior posts and had proposed to remove a number of officials appointed by the King Dr Singh was also reported to have offended the Indian Government by his isolationist foreign policy his opposition to any foreign aid including aid from India and his decision to substitute a two year economic plan prepar ed by himself for the five year plan drawn up by Indian experts

A new National Council with advisory functions took office on December 1 (The formation of this body which was to have aided and advised the Singh Government had been announced on September 8 but the Council had never met during Dr Singh s premiership) Prince Basundhara the King s youngest brother was appointed chairman of the Council which included Mr Arun Shamshere (King Mahendra s brother in law) as the King nominee and the Chief Justice as *ex-officio* member The Council appointed

for a period of five years, will advise King Mahendra on internal security, law and order and general administration.

King Mahendra had invited nearly 30 leaders to a Political Conference on December 6 on the eve of the agitation threatened by the Democratic Front

The Conference discussed a number of national problems including the worsening food situation It was also asked to deliberate on the holding of the first General Elections in the country

King Mahendra told the 19 leaders from about a dozen political parties assembled at the Conference "I am more anxious than you that elections be held

King Mahendra was reported to have told the leaders that if the political Conference ended in failure they were free to launch the proposed satyagraha next day (December 7)

Agitation On December 7 the leaders of the three party Democratic Front holding their respective flags led a giant procession in Khatmandu marking the beginning of a country wide satyagraha demanding General Elections within [illegible] months. The procession culminated in a mass rally

The launching of the satyagraha followed fruitless talks on December 6 between the Front leaders and the Chief Election Commissioner for an agreement on a date for holding the elections

A spokesman of the Front said that while the Chief Commissioner thought that it would require at least 7½ months for holding the elections the Front leaders insisted that the elections could be completed within [illegible] months.

King Mahendra asked the Democratic Front leaders and the Election Commissioner to meet again and report to him the results

On December 8 the President of the Nepali Congress Mr B P Koirala and 47 other volunteers including [illegible] picketed the three outer gates of the Singha Durbar Government Secretariat which was once the residence of the former Rana Prime Minister

Watching the satyagraha were nearly 3,000 supporters of the Democratic Front who shouted [illegible] demanding elections within [illegible] months

To ensure [illegible] of essential services throughout the country the Government promulgated orders under the Essential Services Act 1957 on December 8

A communique issued from the Palace on December 8 described as "impertinent" a petition from the Democratic Front to the King the previous night The Front leaders—Mr B P Koirala Mr D.R. Regmi and Mr Bhadrakali Misra—had sent a petition to the King through the former Prime Minister Mr Tanka Prasad Acharya in which they had said that they did not agree with the Chief Election Commissioner about the timing of the elections The Front is composed of the Nepali Congress Nepali National Congress and Praja Parishad

King Mahendra announced over Radio Nepal on December 15 that Nepal will have its first general elections in February 1959 The elections would be initiated on February 18 1959 the date synchronising with the eighth anniversary of the end of a century-old Rana regime in Nepal and the ushering in of democracy

Following the announcement of the date for holding elections the nine day-old satyagraha launched by the Democratic Front was suspended with immediate effect The Council of Action of the Front which had launched the satyagraha with a view to obtaining elections by June 1958 said that they felt after studying the King's message that it partially met the Front's demand

On an appeal made to the King by three Democratic Front leaders all persons detained in connection with the agitation were ordered to be released, on December 25

Change of Government in Pakistan

Mr I I Chundrigar reaffirmed in Karachi on November 16 his Government's determination to replace the joint electorate system by separate electorates throughout the country despite strong opposition

Addressing a press conference he said that general elections would be held in the country as scheduled in November 1958 under the separate electorate system as between Muslims and non Muslims Allocation of seats for different communities would be made on the basis of electoral rolls which, he said would reflect fairly the composition of the population. Mr Chundrigar added that the separate electorate system was necessary to ensure that [illegible] the political [illegible] He said the Republicans had laid down no conditions before agreeing to be led by the Muslim League in the coalition Government and added that the Republicans had "realised by experience" that the joint electorate system was harmful to the very existence of Pakistan

Speaking in Peshawar on November 23 the leader of the Muslim League opposition in the West Pakistan Assembly Sardar Bahadur Khan said that his party would quit the Central Cabinet if the Republicans failed to honour their solemn assurance to support the separate electorate system

Meanwhile top-ranking Republican leaders had an informal get together on November 22 at the residence of West Pakistan Chief Minister Sardar Abdur Rashid and what transpired at the meeting was tantamount to a firm reaffirmation of their policy to stand by the principle of joint electorate

The League on the other hand quietly observed what it described as Separate Electorate Day on November 22 There were no public meetings or demonstrations but Leaguers did manage to get some *Mullahs* to deliver speeches after Friday congregations in mosques

Top-level parleys initiated by President Iskander Mirza to compose differences between the two major coalescing parties—the Muslim League and the Republican Party—in Pakistan s sixth Government over the electorate issue warded off for some days the crisis in the Chundrigar Government The Muslim League and Republican leaders agreed to defer consideration of the League sponsored Bill to amend the electorate legislation seeking to replacace joint electorate by separate electorate till the fact finding committee of the Redublican Party had submitted its report

Twenty four East Pakistan members of Pakistan s National Assembly in a statement on December 11 declared that East Pakistan would not accept any decision to impose the separate electortate system in the province

Meanwhile it is known that scores of Republican supports sent telegrams to their party chief Dr Khan Sahib to see to it that the Organising Committee scheduled to meet on December 9 did not take any decision which might commit the party to separate electorate They claimed in their messages that the Organ sing Committee would not be within its right to do so as the party s manifesto had clearly la d down that joint electorate would be adhered to

The Awami League victory in the by elections in East Pakistan had a magic effect on West Pakistan Already some of the staunch supporters of separate electorate had begun to advise the Prime Minister Mr I I Chundrigar and his Muslim League Party to bow to the people s verd ct

Sponsors of joint and separate electorates clashed in Dacca on December 7 after a Muslim League sponsored meeting was held in support of separate electorates A Muslim League led procession attacked two shops owned by members of the minority community All H ndu owned shops in the vicinity immediately pulled down the shutters

On December 11 the seven week old Muslim League led coalition Government resigned because of sharp differences over the electorate issue with the Republican Party

President Iskandar Mirza asked Mr Chundrigar to form a new Government But within hours of this announcement Gen Mirza received a memorandum signed by 41 out of 77 members of the National Assembly declaring that they would not support Mr Chundrigar or any other member of the Muslim League as Prime Minister

On December 13 Mr Feroze Khan Noon was asked by Gen Mirza to form a Government

Pakistan s seventh Government in 10 years was sworn in on December 16 with Mr Firoz Khan Noon as the new Prime Minister He heads a six party coalition Government

Mr Noon on December 17 announced Cabinet assignments for eight Ministers including himself who took the oath of office on the previous day

Mr Noon kept the portfolios of foreign affairs and Commonwealth relations States and frontier regions defence economic affairs rehabilitation information and broadcasting Kashmir affairs law and parliamentary affairs

The other assignments are Finance Syed Amjad Ali Industries and Commerce Mr Mozaffar Ali Khan Qazilbash, Interior Mir Ghulam Ali Talpur Food and Agriculture Mian Jaffar Shah Works Labour and Minority Affairs Mr Abdul Aleem Communications Mr Tamizuddin Ahmed Health and Education Mr K K. Dutta

Of the two Ministers of State Mr A K. Das will assist the Finance Minister and Haji Maulabuksh Soomro will help the Prime Minister with his many portfolios

Unification of Govt. In Laos

After a Cabinet crisis lasting 70 days the Laotian National Assembly approved on August 9 a new Government formed by Prince Souvanna Phouma the outgoing Prime Minister the voting being 28 to 8 with

for a period of five years will advise King Mahendra on internal security law and order and general administration

Unification of Govt in Laos

After a Cabinet crisis lasting 70 days the Laotian National Assembly approved on August 9 a new Government formed by Prince Souvanna Phouma the outgoing Prime Minister the voting being 28 to 8 with

one abstention The new Cabinet was a coalition of the Independent and National Progressives the two principal parties In addition to the premiership Prince Souvanna Phouma also took over the Defence Ministry whilst M Katay Don Sasorith became Minister of the Interior and M Phoui Samanikone became Foreign Minister

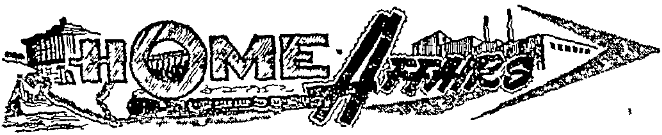
The policy of Prince Souvanna Phouma s new Government—as outlined by him to the National Assembly—was more accommodating to the *Pathet Lao* s demands than his previous offers while insisting as hitherto on the indivisible sovereignty of the Royal Laotian Government Prince Souvanna Phouma now offered to include *Pathet Lao* representatives in the Government He also expressed willingness to incorporate the *Pathet Lao* forces into the Royal Laotian Army after "screening to allow a successor party to the *Pathet Lao* to take part in the elections to be held in January 1958 and to pursue a policy of neutrality' including good neighbourly relations with all neighbouring States

Renewed negotiations between Prince Souvanna Phouma and the *Pathet Lao* which is led by Prince Souphannou Vong (the Prime Minister s half brother) ended in an agreement on October 23 1957 containing the following provisions (1) immediate cessation of hostilities (2) integration of the *Pathet Lao* forces in the Royal Laotian Army within the limits of budgetary possibilities (3) integration of *Pathet Lao* 'civil servants in the Kingdom s administratative system where possible (4) recognition of the *Neo Lao Haksat* the political wing of *Pathet Lao* as a legal party (5) the granting of civil rights to *Pathet Lao* followers on an equal basis with all other Laotians (6) the formation of a new Government of National Union which would include two or three *Pathet Lao* representatives (7) an agreement that Laos would not participate in any bloc or military alliance nor allow any country to establish military bases in Laotian territory (8) acceptance of foreign aid without political or military commitments (9) restoration of the Government s authority over the north eastern provinces hitherto held by *Pathet Lao*

The agreement was approved by the National Assembly on November 2 and the two north-eastern provinces were formally transferred to the Royal Laotian Government on November 18 On the same day Prince Souvanna Phouma presented a new 16 member Cabinet to the National Assembly for investiture including two *Pathet Lao* representatives—Prince Souqhannou Vong who became Minister of Planning and M Phoumvong Vichit appointed Minister of Education The National Assembly passed a vote of confidence in the new coalition Cabinet later the same day

It was pointed out in the British and American Press that with Laos now committed to a policy of neutrality it would form with its neighbour Cambodia a "neutralist" corridor stretching from South China to the Gulf of Siam Western observers nevertheless expressed concern lest Communist influence in the area should be strengthened as a result of this development

---



FORTHCOMING EXAMINATION

Stenographers Examination 1958

The Union Public Service Commission will hold at Bombay Calcutta Delhi Hyderabad Madras Patiala Shillong and at such Indian Missions abroad as is considered necessary an examination in June 1958 for recruitment to vacancies in Grade III of the Central Secretariat Stenographers Service and in posts of Stenographers in Ministries and Attached Offices which have not participated in the Central Secretariat Stenographers Service Scheme

AGE LIMITS on *1 1 1958* *18 — 24* years upper age limit relaxable in favour of Scheduled Castes Scheduled Tribes, **bona fide** displaced persons from Pakistan or from unliberated areas of Jammu and Kashmir residents of the former French Settlements which have now become part of India candidates from the Andaman and Nicobar Island and certain categories of Government Servants

QUALIFICATIONS Matriculation or equivalent Full particulars and application forms obtainable from the Secretary Union Public Service Commission Dholpur House, New Delhi by remitting Re 1/ by money order or on cash payment at the counter Candidates must clearly state on money order coupons **STENOGRAPHERS EXAMINATION JUNE 1958** and also give their name and full postal address in *block letters* *Postal orders* or cheques or currency notes will not be accepted in lieu of money orders. Completed applications must reach Union Public Service Commission by the 22nd February 1958 (8th March 1958 in case of candidates residing abroad)

Punjab Hindi Agitation Suspended

The seven month old Arya Samaj sponsored "Save Hindi agitation in Punjab was suspended on December 27 1957 pending full settlement of the language dispute Earlier the Punjab Government had released some 2 000 *satyagrahis* as a gesture of goodwill to facilitate a fresh round of negotiations for an amicable settlement of the language controversy

The decision about suspension of the agitation came at the end of a round of separate talks between Mr Ghanshyam Singh Gupta Arya Samaj leader and the Union Home Minister Pandit Pant and the Congress President Mr Dhebar Knowledgeable circles unanimously agreed that it was Pandit Pant s tour of Punjab that paved the way for an early withdrawal of the agitation

The Sarvadeshik Bhasha Swatantra Samiti at an emergency meeting on December 23 passed a resolution reiterating its confidence in the leadership of its President Mr Gupta and for the second time vesting him with full authority to suspend or continue the agitation which introduced considerable tension and a sense of instability in Punjab

The original demands of the Samiti were the medium of instruction in schools should be left entirely to the choice of parents there should be no compulsion for the teaching of either of the two languages as a second language at any particular stage Hindi should replace English at all levels of administration office records up to the district level should be in both Hindi and Gurmukhi scripts and there should be one language formula for the whole State

Following considerable silent work by well meaning intermediaries however the Samiti more or less expressed its willingness to accept what came to be known as the compromise formula Generally speaking this formula envisaged liberalisation of the Sachar Language Formula without altering its basic structure—and its extension to the entire State

This formula provided for instruction in Hindi in the Punjabi region (and *vice versa*) even if one student in a class of four in a school asked for the facility The Sachar Formula provided this facility if asked for by 10 students in a class of 40 in a school

The compromise proposals like the Sachar Formula also provided for compulsory teaching of the other language (Hindi or Punjabi) but without its sting This was sought to be done by making the other language an optional ' non qualifying subject for the purpose of examinations

Regarding office records it suggested that while the principle of maintaining office records in the regional language alone might be conceded it should be left to an individual to correspond with the authorities in English or the other languages (Hindi or Punjabi) till such time as the people were not well versed in the regional language

Addressing a public meeting in Delhi on December 29 Mr Ghanshyam Singh Gupta President of the Sarvadeshik Bhasha Swantantra Samiti denied that the Save Hindi agitation was suspended because of the Arya Samaj s failure to maintain the tempo of the *satyagraha*

He said the fact that the *satyagraha* had lasted seven months and was still gaining in strength when it was called off gave a lie to these allegations This is a complete travesty of truth he said and added that the movement had shown hardly any sign of weakening or exhaustion

The Akali Leader Master Tara Singh expressed the view that the Akalis would not allow amendment of the language formula making teaching of Punjabi optional in the Hindi-speaking region If the Government wants the Hindi region people to be freed from the strain of learning Punjabi the proper course will be to abolish the division of the State into two regions In that case the State should be split into two unilingual areas he said

The anticipated round of talks for bringing about a full settlement of the seven month old Hindi Punjabi dispute in the Punjab opened in Delhi on January 3 The Arya Samaj leader Mr Ghanshyam Singh Gupta met the Union

Home Minister Pandit Pant and later Mr Dhebar

Meanwhile it was learnt from sources close to the Save Hindi movement that the main outstanding demand was that there should be no compulsion on the teaching of Hindi in the Punjabi areas and of *Gurmukhi in the Hindi* areas

An amicable solution to this issue could be arrived at according to these sources within the framework of the regional formula on which the Congress High Command seemed to be adamant

It was pointed out that the regional formula among other things provided that pending any agreed solution among the parties concerned P E P S U and Sachar *formulae* would continue to operate in the erstwhile States of P E P S U and Punjab

Under this provision they said there was scope for an agreed solution of the language tangle The parties concerned—the Congress High Command the Akalis and others—could arrive at an amicable settlement to replace the two formulae without in any way prejudicing the regional formula

Such a course it was pointed out would also be in keeping with Mr Nehru s declaration at his recent Press Conference that the language problem in Punjab had been settled a year ago and he did not want to unsettle things which had already been settled

Indus Canal Water Dispute

The efforts of the three representations of the World Bank led by Mr Larz Bengsten to conclude an ad hoc agreement between India and Pakistan for distribution of Indus Canal waters have borne no fruit Discussions on an agreement took place in Delhi in early part of December separately between the Bank representatives and the Indian delegation on the one hand and the former and the Pakistan delegation on the other The Bank team of experts left for Washington on December 17 to report to Bank headquarters their discussions in India and Pakistan

India is understood to have maintained that Pakistan should draw the maximum supplies through the three link canals which she had already constructed This would enable India to reduce her supplies from the three eastern rivers of the Indus basin alloted to her by the World Bank under the Bank s 1951 proposals and utilize that water herself

Pakistan is understood to have put forward the plea that it was not possible to draw the maximum supplies through her link canals the canals had been damaged It would take some time for repairing them Moreover, Pakistan demanded that India should pay the cost of repairs to these canals

India was not prepared to pay unless it was part of an overall settlement of the canal waters dispute—acceptance by Pakistan of the Bank proposals of 1954 without any conditions

Mr S K Patil, Minister for Irrigation and Power announced in the Rajya Sabha that the Government of India will take a fresh decision on the question of distribution of supplies at the beginning of the new crop season on April 1, 1958 in the light of the circumstances at that time

Mr Patil said the failure of the recent talks for *ad hoc* transitional arrangement for a further period did not present a new situation Since the expiry of the last transitional agreement between India and Pakistan on March 31 1957 the water supplies had been distributed in accordance with the principles of the Indo Pakistan agreement of May 4 1948 and the principles proposed by the World Bank for such transitional arrangements

The Minister among other things recalled that the Indo-Pakistan agreement of 1948 provided for progressive diminution of water supplies to Pakistan Mr Patil also reiterated that after 1962 it would be impossible for India to supply any water to Pakistan. To do so he added would mean jeopardising the interest of millions of Indian farmers

At a press conference in Karachi the Pakistan President Gen Mirza, said that if India would stop supply of water Pakistan would consider it as aggression "That will reduce three or four million acres of land in our country to arid waste When our people are going to die of hunger they might do anything he added

A fresh round of talks on the Indo-Pakistan canal waters dispute is expected to take place when Mr W B Iliff Vice President of the World Bank visits the sub-continent about the last week of January 1958

Though there is no definite programme as yet connected with Mr Iliff's visit, it is regarded as probable that he would make another effort to solve the dispute

India has it is learnt made it known to the World Bank that while she is willing to

ave the mediatory efforts of the Bank until final settlement of the ten year old dispute reached the existing arrangements cannot ontinue indefinitely and that in any case he cannot wait beyond 1962

Sheikh Abdulla Set Free

Sheikh Abdulla along with his two other colegues Khwaja Ali Shah and Sufi Mohammed Akbar was released from the Kud sub-jail on anuary 8 Sheikh Abdulla was offered transport facilities to proceed to Srinagar but he declined the offer and preferred to remain at Government Rest House near Kud. With his release the monthly payment of Rs 1,000 to his family and the daily allowance of Rs 25 given to him during the period of detention, has been stopped.

There was a great deal of speculation as to whether there has been a change of heart on the part of the former Premier and whether he would adjust himself to the changed conditions or assert himself to seize leadership One thing is clear that the supremacy of his leadership has vanished as there were no demonstrations in the Kashmir Valley by his erstwhile followers and everywhere there was calm Only few intimate friends of his greeted him when he came out of jail Though the future movements of Sheikh Abdulla were not clear nothing was left to chance by the State government and all moves had been foreseen and the Government was ready with steps to meet them In his press conference Sheikh Abdulla did not express his future programme but said that it all 'depends on circumstances

The *Khidmat* official organ of the National Conference, said if Sheikh Abdullah adopted an attitude contrary to the popular stand on national issues, including the State s accession to India the National Conference would oppose it and give a correct lead to the people

Mr N C Chatterjee the Hindu Mahasabha leader said at a public meeting in New Delhi that the release of Sheikh Abdullah would add to the difficulties and complexities of the Kashmir situation Greater vigilance will now be needed he added

Pakistan welcomed the news of Sheikh Abdullah s release from detention But there was an undercurrent of suspicion in political circles in Karachi that India had timed his release to coincide with the visit of Dr Frank Graham the U N representative to the Indian sub-continent It was widely believed in Karachi that in its decision to release Sheikh Abdullah India was more 'tactical than sincere

The continued detention of Sheikh Abdullah has been an effective propaganda weapon in the hands of Pakistan which has sought to impress the outside world that freedom is suppressed in the Kashmir Valley With the release of Sheikh Abdullah India has taken the wind out of the sails of Pakistan s propaganda that freedom was being suppressed in Kashmir

Story of Dismissal Sheikh Abdullah s dismissal as Prime Minister of Kashmir immediately followed by his arrest at Gulmarg on August 8 1953 climaxed a ten week-old crisis in the State Cabinet and the National Conference over his theory of an independent Kashmir Sheikh Abdullah then President of the Conference put forth his idea first in the Conference Working Committee but that body threw it out by an overwhelming majority

In dismissing Sheikh Abdullah the Sadr i Riyasat stated that joint responsibility of the Cabinet had become impossible under Sheikh Abdullah s leadership in view of the acute differences of opinion between the members of the Government on the basic issues political economic and administrative affecting the vital interests of the State

Sheikh Abdullah s Cabinet colleagues—barring Mirza Afzal Beg who was arrested the same day as Sheikh Abdulah—attributed the Sheikh s volte face —he had been among the stoutest champions of the irrevocable nature of Kashmir s accession to India—to an attempt to cover up his failure to provide a clean and efficient administration

Events moved rapidly in August 1953 when elections were being held to the National Conference In Anantnag the stronghold of Mirza Afzal Beg principal lieutenant of Sheikh Abdullah in his new line the no-changers who rallied round Bakshi Ghulam Mohammed and Mr Ghulam Mohammed Sadiq the then President of the Constituent Assembly (Mr Sadiq had described the idea of an independent Kashmir as a mad dream) captured as many as 16 of 23 primary committees

Sheikh Abdullah who was the President of the Conference reacted by postponing the election of delegates to the annual session He sounded members of the General Council but found them as adamant as the Working Committee in maintaining *status quo* in regard to Kashmir s relationship with India

On August 7 Sheikh Abdullah asked the Hea th Minister, Mr Shamlal Saraf, to resign.

His ' charge against Mr Saraf was that there were serious administrative complaints regarding the working of the departments under him

The next day the majority of the members of the Cabinet led by Bakshi Ghulam Mohammed formally presented a memorandum to Sheikh Abdullah expressing dissatisfaction with his leadership

Meanwhile the Sadr i Riyasat suggested to Sheikh Abdullah to hold a Cabinet meeting under his (Sadr i Riysat s) chairmanship to thrash out all issues fully and frankly Sheikh Abdullah declined the invitation and went on a holiday to Gulmarg

On August 9 the Sadr i Riyasat dismissed Sheikh Abdullah Opinion was widespread in Srinagar that the United States Government had encouraged Sheikh Abdullah in his dream of independent Kashmir with himself as the head But such allegations were strongly denied by the then U S Ambassador in New Delhi, Mr George V Allen

Krishna Menon Explains Stand On Kashmir

' Kashmir was is and would be an integral part of the Indian Union and only the Parliament of India can decide the future of a component part of the Indian Union declared Mr Krishna Menon addressing a crowded meeting under the auspices of the Indian Council of World Affairs at Sapru House New Delhi on December 25 1957

He said Kashmir was not an international question at all it was purely a domestic problem which had been drawn into the international plane because India chose to ask the U N to use its good offices to see that aggression on Indian territory was vacated.

It was not open to any external power or forces to take interest in detaching any part of the Indian Union and handing it over to another country

He said Kashmir was an integral part of the Indian Union just like any other State and there was no provision in the Indian Constitution for any part of the Union to secede from it Such a provision was not something peculiar or new in the Constitution India never considered the question of Kashmir as a problem although in some quarters there had been attempts to suggest that it was a no man s land over which somebody else had a better claim according as the U N may decide

There was no provision in the Indian Constitution which enabled any State Government of the country to surrender the country s sovereignty over any part of her territory Parliament alone is competent to decide Mr Menon said that under the tripartite agreement between the U K India and Pakistan the Indian princes were given the freedom to attach themselves to either India or Pakistan

There was no question of conditional, tentative or provisional accession As soon as Kashmir acceded to India India was duty bound to go the succour of that part of India which had become the victim of aggression. In that India was performing a national and international duty because the U N Charter enjoined on every member country to defend its sovereignty against external aggression.

Even if it was argued that Kashmir s accession was not legal it was India s duty to go to the aid of Kashmir when she was invaded, because that was an obligation which India inherited from the British when they left India. India gained freedom by negotiation and she succeeded the British regime inheriting all liabilities, obligations and assets

If Britain was now seeking to challenging this agreement then she would be challenging the whole basis of Indian independence We will not allow Britain to challenge that Mr Menon added If it was argued that Kashmir was foreign territory India had a right to go to the rescue of that territoy The situation would be different only if the Indian Army refused to come away

India Mr Menon asserted had entered into no new commitments at th U N The Kashmir problem called for the restoration of India s authority over the whole of Kashmir territory including the garrisoning thereof in order to protect the trade routes

The nations of the world had come to realize that India of all countries was the most likely to maintain her frontiers in a peaceful manner India was not fighting for a cabbage patch somewhere but it was an issue concerning the defence of the entire Indian Union India was not prepared to barter away her independenc or permit any amputation of her territory It would be a dereliction of national duty as well as international obligation not to defend one s overeign territory If one part of the country could go to an aggressor then a similar fate may occur to other parts of the country also Mr Menon said

Speaking at a reception held in his honour in Delhi on January 4 Mr Menon categorically declared that Dr Graham, when he visits Delhi, need not expect to have any ' date " with

the Government of India and there would be no secret talks or negotiations with him on the Kashmir issue which the Government cannot share with the Public Indeed that would be a violation of the U N Charater

After the Jarring report, Mr Menon said the Security Council had no right to call upon one individual nation to demilitarize If any body had to demilitarize it was in that area held by the aggressor and if he was called upon to do so, it would be entirely in accordance with international law and morality

Mr Menon gave the quietus to any talks of India accepting the *status quo* along the present ceasefire line He cited the example of Korea Indo-China Germany and India where partition of the country seemed to be the fashion amongst empire-owners So far as the Kashmir issue is concerned we did not take it to the Security Council as one of the parties to the cold war We went there of our own volition saying that a part of our union had been invaded and that invasion must be terminated and the position restored

Mr Menon reiterated that the ceasefire only meant that until the question of aggression was settled and Pakistan vacated that aggression she would be allowed to remain in the territory she had invaded The Security Council had found that all negotiations to solve the problem of aggression and vacating, it had been fully taken advantage of by Pakistan to consolidate her position in the territory she had illegally occupied Not only that Mr Menon said aggression was being continued He referred to the subversive propoganda and the bomb incidents in Kashmir which meant clearly that the security of a part of the Indian Union was again being threatened If we kept quiet Mr Menon warned there was every likelihood it would spread to other parts of India There was no other solution to the Kashmir problem except that the 40 000 sq miles held by the aggressor should come back to India

Mr Nehru s Statement on Kashmir

The Prime Minister Mr Nehru told a group of 36 journalists from 13 countries in New Delhi on January 2 that there could be no solution of the Kashmir issue until the U N asked Pakistan to 'get out of Kashmir

The Prime Minister said Pakistani forces had no right to be in Kashmir which was Indian territory legally constitutionally and logically Pakistani aggression in Kashmir was of the worst type he said and I include aggression in Hungary and Korea

Indian forces were in Kashmir because it was part of Indian territory It is our right to be there Pakistan has no justification whatsoever to be there Pakistan is there illegally said Mr Nehru in answer to a question put to him by the visiting newsmen as to why India maintained her forces in Kashmir while asking Pakistan to withdraw hers

Mr Nehru said that one of the first resolutions of the U N C I P asked Pakistan to withdraw her forces from Kashmir before a plebiscite could be held Have they done it ? What right Pakistan has to talk about plebiscite when she has not vacated her aggression in Kashmir? Let Pakistani forces get out of Kashmir and then let Pakistan talk about plebiscite Mr Nehru said

The Prime Minister was reported to have said that there was no question of India accepting any intervention by the U N on the Kashmir issue when a newsmen told him that the Pakistan President had told newsmen in Karachi that his country would be ready to abide by any conditions imposed by the U N as a prelude to the holding of a plebiscite

Mr Nehru told them that India had gone to the U N nine years ago with a complaint against Pakistani aggression in Kashmir There was no question of the Kashmir issue being decided unless the U N first took the decision to ask Pakistan to withdraw her armed forces from the State The first and the foremost thing is for Pakistan to vacate her aggression in Kashmir he said

APPOINTMENTS, VISITORS, ETC THIS MONTH

APPOINTMENTS

Mr Rikhi Jaipal of India elected Chairman of the U N Trusteeship Council s Standing Committee on Petitions on Dec 11

Mr Asoka Mehta declared elected to the Lok Sabha from Muzaffarpur Constituency on Dec 12

Dr Sartono, Parliament Speaker sworn in as Acting President of Indonesia on Dec. 20, for the period *Dr Sukarno* remains abroad

Shri Jagat Narayan appointed additional judge of the Rajasthan High Court for two years

Mr T T Krishnamachari and Dr D G Vyas appointed members of the Central Ad visory Board for music attached to the Ministry of Information and Broadcasting for a further period of two years

Mr John Bogolo Erzuah High Commissioner for Ghana presented his credentials to President of India on Dec. 17

Mr M.A M Muttiah Vice preside t of the Southern India Chamber of Commerce appointed Sheriff of Madras for the com ng year, succeeding *Mrs Clubwala Jhadav*

Mr P K Ponomarenko new Russian Ambassador presented his credentials to Dr Rajendra Prashad on Dec 19

Mr U N Dhebar re-elected President of the Congress for next two years it was announced on Dec. 20

The Punjab Government nominated Bhai Jodh Singh as a member of the Punjab Legislative Council on Dec 21

Mr Mohinder Singh Bedi I A S appointed Director of Public Relations Punjab on Dec 23

Mr A Bhagvantha Rao sworn in a Minister of Andhra Pradesh at Hyderabad on Dec 25 The strength of Cabinet now is 14

General Thanom Kittleachorn nominated on Dec 25 to be new Premier of Thailand

Mr James Richards resigned as Mr Eisenhower s Special Assistant for the Middle East on Dec 25

Dr Shi chi Nasu Ambassador of Japan presented his credentials to Dr Rajendra Prashad on D cember 26

Prof Vicente Fatone Ambassado of Argentina presented his credentials to Presi on Dec 28

Mr Atulya Ghosh M P re-elected President of West Bengal Pradesh Congress Committee for the fourth term on Dec 29

Mr R D Joshi Under Secretary in the Delhi Development Department appointed election officer to conduct the elections to the Delhi Municipal Corporation

Mr Khub Chand India's new Ambassador to Italy presented his cred ntials to President Giovanni Gronchi in Rome on Jan 7

Mr Richard Gordon Turnbull, appointed Governor and Commander in-chief of Tanganyika succeeding *Sir Edward Twining* on Jan 8

OBITUARY

Mr Fredrick George Creed (84) who invented teleprinter system died at Croyden near London on Dec. 11

Mr Lingraj Mishra Congress member of Rajya Sabha, died in Orissa on Dec. 18

Mr Kantilal Munshaw an industrialist of Bombay and Rotarian died in Ahmedabad on Dec 21

Mr Justice M C Shah (59) judge of the Rajkot Divisional Bench of the Bombay High Court, died at Rajkot on Dec 20

Mr Eric Coates British Composer of popular orchestral music died at Chichester (Sussex) on Dec 20

Mr S Venkataraman (47) Deputy Secretry Ministry of Irrigation and Power died in New Delhi on Dec 24

Norma Talmadge (60) Hollywood star of silent screen died at Las Vegas (Nevada) on Dec 24

Mr R K Sidhwa (75) a former Minister of State for Home Affairs died in Bombay on Dec. 28

Dr Arthur James Ewins one of the discoverer of anti phenmonia drug known as M and B, died in London

Vice-Adm Sir Humphery Walwyn (78) who reorganized undivided India's Royal Indian Navy died in London on Dec. 31

Sir Andrew Clow (67) last Governeor of Assam under British rule in India died in Edinburgh on Dec 31

Lord Waverly (75) Chancellor of the Exchequer as sir John Anderson from 1943 to 1945 died in London on Jan 4

Rumania s President Petru Groza (72) died on Jan 7 at Bucharest

VISITORS, ARRIVALS Etc

President Sukarno of Indonesia arrived in Calcutta on Jan 6 on a six day visit to India

A trade delegation from Sudan led by Mr I O Ishaq Director Ministry of Commerce and Supplies arrived in New Delhi on Dec 10

The eight member Soviet women s delegation arrived in New Delhi on Dec 20 on a three week tour of India

Prof Vicente Fatone the new Argentine Ambassador to India arrived in New Delhi on Dec. 18

A four man delegation from Ghana led by Mr A E Inkumsah Ghana s Minister for Housing arrived in New Delhi on Dec. 21 to entplore the Indian market for export and import trade

Dr Paule Savic the top atom scientiest of Yugoslavia, arrived in New Delhi on Dec 30 to attend the 45th session of the Indian Science Congress

Mr Viliam Siroky Prime Minister of Czechoslovakia arrived in New Delhi on Jan 3 for 12 day visit

Mr Malcolm S Adiseshiah Assistant Director General of UNESCO arrived in New Delhi on Jan 4 on official visit

A six member delegation from Zanzibar, led by Mr R O Williams arrived in Bombay on Jan 7 for a fortnight tour of India

Mr Harold Macmillan British Premier arrived in New Delhi on Jan 8

Mr Henry T Heald President of the Ford Foundation in U S A arrived in Calcutta on Jan 10 for a three week visit to India

AWARDS PRIZES Etc

Bertrand Russell the British Philosopher scientist and writer awarded the 1957 Kalinga prize for the popularization of science

Dr C V Raman Indian physicist and Nobel prize winner awarded International Lenin Prize for strengthening peace between the peoples

BASIC EDUCATION IN INDIA

The programme of basic education has now been accepted as the pattern of our educational system and elementary educatiun is gradually being brought in line with it

The number of Junior and Senior Basic Schools for boys and girls increased from 34 878 in 1952 53 to 47 813 in 1955-56

The number of pupils in Junior and Senior Basic Schools rose from 30 81 524 in 1952 53 to 50 60 207 in 1955 56

The Government of India appointed an Asses ment Committee in 1955 to make an on the stop survey and enquire about the development of basic education in the country The report of the Committee is under consideration of the State Governments and in so far as they are acceptable to them they are being implemented

On recommendation of the Standing Committee of Basic Education the Government set up the National Institute in 1956 to conduct research in basic education and impart advance training to inspectors administratorr and other higher personnel

in Punjab was withdrawn pending fresh negotiations for a settlement of the dispute

28 The President of India gave his consent to the Delhi Corporation Bill and the Delhi Development Bill which the Parliament passed at the recent session

Yugoslavia and Yemen established diplomatic relations for the first time with the signing of a friendship treaty and 'scientific technical cooperation' pacts in Belgrade

The new Assam Ministry headed by Mr Bimala Prasad Chaliha was sworn in at Shillong

29 Master Tara Singh said in New Delhi that he had no faith in the Union Government "I have faith only in Mr Nehru

The 8 000 ton Cruiser I N S Mysore became the new flagship of the Indian Navy at a ceremony in the high seas 200 miles off Bombay

FIGHT FOR FREEDOM

(1857 TO 1947)

Attainment of independence by India in 1947 was unique not so much in its being a peaceful phenomenon as in the character of the struggle which preceded it.

Many nations fought for their freedom and many are fighting for it to-day Such fights are usually characterised by heroism and a spirit of sacrifice and by a definite aim—the overthrow of alien power An appeal is made to the patriotic or religious sentiments of the people or to their duty to save the country from exploitation. Our first struggle for freedom which culminated in the uprising of 1857 also had these elements and however we may admire the bravery and patriotic fervour of the heroes of this first war of Indian Independence it is only the second phase of our struggle which makes it stand out as unparallelled in world history

This second phase began when Mahatma Gandhi took up the leadership of the country in 1919 His objective was not only independence for India but a happy and peaceful life for the whole humanity and since political freedom was a necessary condition of peace and happiness he advocated it as an ideal for every subject nation He aimed at the uprooting of alien rule and at eradicating social and economic evils which were a cause as well as an effect of foreign domination

Our struggle had now on a moral basis and its righteousness consisted in its reliance on truth and non violence Its leader sought to make the people fearless He advocated love even for those against whom we fought. Our objective is noble and so we must ennoble it further by adopting noble means he said. Such a fight the world had not seen before neither in the heroic deeds of the Spartans nor in the democratic fervour of the Americans This our struggle is further marked by dramatic situations which arose and in their equally dramatic solutions and by not only a feeling for the present but also a vision of the future—not only for India but for the whole world

1857 Struggle.

To trace the history of our Independence Movement we have to go back to the 23rd of June 1757 and visualise the treachery and deceit of the officials of the East India Company on the battlefield of Plassey It becomes painfully clear that the prominent Indians those days looked upon this momentous event as a revolution in the feudal sense Even the astute Baji Rao Peshwa was deluded into the belief that the British merchants were clearing the ground for a Maratha rule in India

It was given to Tipu Sultan for the first time to realise the danger of British domination But it was now the end of the 18th century and the British had consolidated their position not only in India but in other colonies also The exploitation nay the loot of Bengal had built up the industries of England and Great Britain was looking forward to a glorious nineteenth century

However the elimination of some of the Indian States by Lord Dalhousie the awakening of the people of India to the atrocities committed by the British merchants under the protecting arm of their Government and the devastating measures adopted by the East India Company and the belief of the rulers that they were firmly established in India created a situation which burst out in 1857 into a country wide revolt in which not only the Indian soldiers employed by the Company but even simple illiterate people of the countryside took an active part.

Spread Of The Revolt

Breaking out on 10th May 1857 at Meerut the fire of revolt soon spread to Delhi Kanpur Lucknow Bareilly and other parts of India—from the Indus to the Brahm

putra. Upto June 5th the Indian sepoys rose at Nasirabad in Rajputana, at Nimach in the Gwalior State at Bareilly in Rohilkhand and at Lucknow Banares and Kanpur in Oudh while the Rani of Jhansi headed the revolt in Bundelkhand

Heroic Fights

It appeared that the whole of Northern India had thrown off the alien yoke The tide began to turn before the revolution had completed one month The combined British forces marching from Ambala and Meerut defeated the potriotic army at Badli Sarai on June 8 though the real battle of Delhi was fought from September 14 to 20

The siege of the entrenchments at Kanpur began on June 6 and lasted till the 26th that of the Residency at Lucknow began on July 1 and continued till its final relief on November 25 On June 11 Neill a British General by bold and fortunate stroke secured the great fortr ss of Allahabad Havelock, another well known figure fought for Kanpur and secured it before the end of July But the real battle after Delhi was one for Lucknow The fall of Delhi on September 20 and the relieving of Lucknow on November 25 marked the end of the first phase of the revolt

The second phase began in December The revolutionaries had lost most of their strong holds but they had spread in the country side Lucknow itself was not formally captured till March 1 1858 and Bareilly till May The Talukadars in Oudh could not be subdued till the year 1858 was out Some of the toughest fights took place during this phase Jhansi was invested in March and though the fortress fell at last yet the English generals acknowledged in the Rani of Jhansi the best fighter they had yet known The Rani of Jhansi and Tantia Topi round whom the pursueres were closing had conceived the brilliant design of marching to Gwalior But the British troops though wearied advanced on Gwalior and defeated the great heroes of the war of 1858 in two battles in one of which the Rani of Jhansi met a soldier's death (June 17) Gwalior was captured on June 20 1858

Tantia Tope who had miraculously escaped continued to dodge and harass the British till April 1859 when he was captured and hanged

The war of 1857 failed to achieve its immediate objective of freeing India from the foreign yoke but it had created a nationalistic atmosphere in the country and had brought to light the fact that the Indians could not be ruled like dumb driven cattle The end of the rule of the company was a significant event nd may to some extent be attribut-d to the heroic struggle of 1857

New Forces

The memory of the terror perpetrated by the British during the 1857 war and afterwards had subsided by the end of the 19th century New nationalism was taking form because of the spread of edeuation rise of an upper middle class developments though meagre in the fields of industry and commerce ard chiefly because of the teachings of Swami Vivekanand and Swami Dayanand who held political freedom as a basic need of spiritual life The flare up came in 1905 with the partition of Bengal.

Pro-British Attitude

The sentiment which broke out in Swadeshi movement in 1905 was created in the early middle of the 19th century

The earlier institutions such as the British India Society Calcutta and the British Indian Association of Calcutta ' were meant to voice the grievances of the people and to work for their political uplift But organised political activities were resumed by 1875 The Indian Association of Calcutta was formed in that year The Sarvajanik Sabha of Poona and other similar organisations came into existence in the major cities at about the same time The voice of new India began to be heard through her newspapers There were no less than 847 newspaper in India in the early eighties The Neo-Hinduism of Raja Ram Mohan Roy The first modern

man in India (Panikkar) and perhaps the first earnestmind ed investigator of the science of Comparative Religions that the world has produced. (Monier Williams) Swami Dayananda Saraswati the founder of the Arya Samaj movement and Rama Krishna Paramahansa the man God of Dakshineshwara began to be reflected in political trends.

The Indian National Congress

The first murmurings of a new life became more and more audible The Indian National Congress ushered into existence in Bombay on December 28, 1885 was the expression of a new national urge

From 1885 onwards the Congress met during Christmas week every year It attracted more and more public attention Its sessions were more and more crowded

The Congress was not a popular organisation however The leadership represented a western and liberal point of view The leaders admired Britain and everything British.

One section of Congressmen steadily lost faith in the bonafides of the Government. A spirit of opposition manifested itself Not a few felt that reforms could be secured by action and action alone. Japan s victory over Russia in the Russo-Japanese War 1904-5 stimulated the new spirit. It found a brilliant exponent in Lokamanya Bal Gangadhar Tilak.

Swadeshi Movement

The partition of Bengal in 1905 stiffened the Cong ress opposition to the Government.

A movement to annul the partition spread all over India under Surendra Nath Banerjee Bipin Chandra Pal Atabindo Ghosh and others Novel weapons were em ployed to exert pressure upon the Government. These were the boycott of British goods adoption of 'Swadeshi (use of indigenous goods) and the spread of national education. The Congress endorsed the programme in its Session of 1906 and laid down Swaraj (self rule) as its goal This Swaraj was however nothing more than Colonial Self Government A new life was breathed into the dry bones of the Congress It spoke through Tilak, Bipin Pal Lajpat Rai the Lion of the Punjab and other 'extremist leaders. The moderate leaders like Surendra Nath Banerjee Feroze Shah Mehta and Gopal Krishna Gokhale did not see eye to eye with them The difference reached its climax in an open split between the two sections in Surat Session of the Congress in 1907 The 'moderates captured the Congress But the extre mists continued to support the Swadeshi Movement

Convinced of the futility of repression the Govern ment sought to rally the moderates' by introducing the Minto-Morley Reforms in 1909

Constitutional Struggle

The Minto-Morley Reforms antagonised the 'moderates and prepared the ground for their re-concilia tion with the extremists The straying flock came back to the fold at Lucknow in 1916 The Congress came to an understanding with the Muslim League (founded in 1906) in the same year and at the same place The Congress and the League jointly drafted a constitutional scheme on the basis of Dominion Status and separate electorates The two Home Rule Leagues founded earlier in the year—one under Mrs. Annie Besant and the other under Lokmanya Tilak joined hands to popularise the League-Congress agreement, commonly referred to as the Lucknow Pact

The Montague-Chelmsford Report on further consti tutional advancement in India was published in 1918 The Congress condemned the Report as inadequate disappointing and unsatisfactory The moderates thereupon left the Congress and organised the Indian Liberal Federation.

Non Co operation

The Rowlatt Act the Jallianwallah Bagh tragedy at Amritsar India wide [illegible] the Muslim [illegible]

the victorious Allies of the First Great War and last but not least the disappointment of Nationalist India with the too wooden too iron too inelastic and too antediluvian Government of India Act 1919 had stirred the Indian mind to its depths

Gandhiji a practical idealist that he was who had come to India in 1914 after successful peaceful campaign in South Africa saw in the Indian Muslims attitude to Turkey an opportunity of uniting Hindus and Mohammadans as would not arise in a hundred years He was not the man to miss it. Non violent fight non co-operation prescribed by him as the sole weapon in India s fight for freedom evoked a hearty response throughout the length and breadth of the land About two-third of the electorate boycotted the first general elections held under the Government of India Act 1919 Students came out of schools colleges and universities Lawyers suspended the practice Huge bonfires of England made clothes became a regular feature of the Congress movement Civil disobedience and passive resistance against the Government began to be talked of 30 000 Indians Hindus and Muslims courted imprisonment The prison lost its terror Incarceration became a badge of honour home spun home woven Khadi the livery of national service The Prince of Wales sent out to India by the British Parliament to rouse the traditional loyalty of the Indian masses was greeted every where with deserted streets and closed shopswindows At long last India ahd awakened from her age-old slumber

The Congress next took steps to organise civil disobedience and appointed Mahatma Gandhi the sole executive authority to lead the national movement An unfortunate mob-violence at Chaura Chauri near Gorakhpur in the Uttar Pradesh where an infuriated mob burned the local police station and killed 22 policemen however led to the abandonment of the idea of civil d sobedience in 1922 A rift appeared in the ranks of the Congress itself The Swarajist Party organised by Deshabandhu Chitta ranjan Das and Pandit Motilal Nehru adopted the programme of council entry to fight dyarchy (introduced by the 1919 Reforms) from within by uniform consistent and continuous obstruction The Swarajist members in the various provincial councils and Central Assembly exposed the utter hollowness of the Reforms of 1919 but they failed in their main objective of wrecking the 1919 constitution

The boycott of th all white Simon Commission in 1928 by the Hindus and Muslims alike drew the Congress and the League closer for a time But the All parties Convention towards the end of the year rejected Mr M A Jinnah s claims to speak on behalf of Muslim India Mr Jinnah thereupon joined the All India Muslim Conference and the manifesto of Muslim claims issued by the Conference early in 1929 was the basis of the notorious fourteen points formulated by Mr Jinnah later in the year

Civil Disobedience

Jawahar Lal Nehru who presided over the 1929 (Lahore) Session of the Congress hoisted the National Flag of Free India at Lahore on the Ravi Bank as the clock struck mindnight on December 31 1929

Gandhiji s historic march to Dandi which started on April 6 1930 opened a new phase of India s fight for freedom.

Viceroy Lord Irwin tried for conciliation at the instance of the White Hall By the Gandhi Irwin Pact signed on March 4 1931 The Congress agreed to suspend civil disobedience and to participate in the proceedings of the Second Round Table Conference on India in London

The First Round Table Conference on India had in the meanwhile met in London on November 30 1930

Gandhiji attended the Second Round Table Conference as the sole Congress representative He returned empty handed Repression was again the order of the day The Congress decided on January 1 1932 to renew civil disobedience and the boycott of British goods Gandhiji was arrested

The Congress called off the Civil Disobedience Movement in May 1934 It decided later on to try the Government of India Act 1935 In the general elections of 1937, the first under the Government of India Act, 1935 the Congress captured the majority of seats in the Legislative Assemblies of seven out of eleven British India Provinces—Bombay Madras Bihar Orissa the United Provinces Central Provinces and N W F P Assam joined later

On the grounds that the British Government dragged India into World War II (1939-45) without first consulting the Indians and that it refused to declare its future policy in regard to the constitutional position of India the Congress Ministries in the Congress provinces except N W F P resigned towards the end of 1939

A left wing had developed within the Congress in the meanwhile under the leadership of Subash Chandra Bose

Quit-India Movement.

With Japan s entry into the War in December 1941 the position of Britain and her allies in the Far East and in South East Asia became very critical India s safety was threatened His Majesty's Government sent Sir Stafford Cripps in March 1942 to resolve the constitutional deadlock in India. All that he offered was Dominion Status and a Constituent Assembly after the war Gandhiji rightly characterised the Cripps offer as a Post-dated cheque

The Government arrested the Congress High Command and all Congress leaders including Gandhiji—though he had no official connection with the Congress—on August 9 1942 following the A I C C. resolution of August 8 favouring the launching of a country-wide mass struggle still the movement spread and engulfed the whole country

The 1942 revolt was crushed. But the Government was called upon to tackle another problem Subhash Chandra Bose interned in his Calcutta home had disappeared from India in 1941 He had established contacts with Germany in Europe and with Japan in Asia and set up a free Goverment of India (Azad Hind Hakumat) at Singapore

The Indian National Army (Azad Hind Fauj) organised by him heroically fought its way to the North Eastern frontiers of India in 1943

Dawn of Independence

The Labour Party came to power in England in 1945 Mr (Now Lord) Attlee headed the Government He despatched a three man Cabinet Mission to India in 1945

The Mission having failed in its efforts to bring the Congress (its leaders were released in 1945) and the League together announced its plan for the solution of the Indian problem on June 16 1946 This plan envisaged (i) a Federation of the whole of India (ii) a Constitution Assembly elected on communal basis and (iii) the establishment of an interim National Government by expanding the Viceroy s Executive Council and by appointing leaders of the different political parties to the membership of the Council

Dramatic situations followed the announcement of this Plan—the Muslim League trying to out wit the Congress but ultimately the Congress was invited to form the Interim Cabinet

The Viceroy s Executive Council under Nehru s guidance worked like a cabinet and changed the whole spirit and outlook of Indian Government. But Lord Wavell brought in the Muslim League as counterpoise to Nehru and his team of Congress Leaders

The Viceroy s Council soon after the admission of the Muslim League presented the spectacle of a house divided against itself

A tense atmosphere prevailed in the country After protracted negotiations the British Government declared

on February 20 1947 its decision of transferring power to Indian hands by June 1948

Lord Wavell was replaced by Lord Mountbatten as the Governor General of India He was to take immediate steps for the liquidation of Britannic Majesty s Indian Empire

Lord Mountbatten assumed office on March 24 1947 The Mountbatten Plan of June 3 1947 recommended the partition of India and also of Bengal and the Punjab and the immediate grant of Dominion Status to the Indo Pakistan Sub continent The Plan was accepted by Congress and the League Power was transferred to the newly created Dominions of India and Pakistan on August 14-15 1947

As the day dawned on the 15th of August 1947 the sense of jubilation was over shadowed by the un precedented acts of bloodshed arson and rape committed in the Panjab and Bengal especially and our freedom would have been in jeopardy if the government were headed by less able men and women Besides law and order there were many more problems which the country had to face and it appeared that the battle for real freedom freedom from want and poverty had just begun We have not yet vanquished the dragons which suddenly raised their heads after our independence but these ten years of our political freedom have amply proved that we are well on our way to conquest to the attainment of peace and happiness which are the *sine qua non* of real freedom

---

INDIAN CONSTITUTION SINCE 1950

The Constitution of India which establishes a Secular and Democratic Republic based on Socialist Pattern of Society has undergone some very important changes since its inauguration on 26th January 1950 But its spirit remains unchanged

Salient Features

The salient features of our Constitution which make India a unique republic in the world are —

1 Though Indian culture is essentially religious and spiritual the Constitution establishes a secular state i e it favours no religion above other religions

2 It guarantees fundamental rights to the individuals such as justice—social economic and political—liberty of thought expression belief faith and worship equality of status and of opportunity

3 It lays down the directive principles of state policy so that the state shall strive to promote the welfare of the people

4 There is only one citizenship for the whole of India

5 Indian Constitution is federal in structure with residuary powers vested in the Central Government It ensures autonomy to the states envisaging local self-government for individual villages and towns and a strong central government

6 It ensures unity and solidarity of India by not giving any state the right to secede

7 It installs a uniform administration throughout the country by means of special All India Services and a single Judiciary

8 By granting in the case of emergency special powers to the President a popularly elected constitutional head it secures against internal or external danger

9 The Constitution is flexible and elastic so that it can be amended to meet the changed circumstances in the ordinary process of law making

Amendments to the Constitution

Seven amendments have been made in the Constitution Constitution (First Amendment) Act, 1951

The Proviso to Act 19 was amended so as to impose reasonable restrictions on the freedoms enumerated under that article The clause (2) States that the State can impose reasonable restrictions on the exercise of the freedom of speech and expression in the interests of the security of the State friendly relations with foreign States public order decency or morality or in relation to contempt of court defamation or incitement to an offence

To Article 15 sub-clause (4) was inserted stating that the State can make special provision for the advancement of any socially and educationally backward classes of citizens or for the Scheduled Castes and the Scheduled Tribes

Two new Articles 31 A and 31 B were inserted Article 31 A provides that no law providing for the acquisition by the State of any estate or of any rights therein or for the extinguishment or modification of any such rights shall be deemed to be void on the ground that it is inconsistent with or takes away or abridges any of the rights conferred by any provisions of this Part

Constitution (Second Amendment) Act 1952, abolished the upper limit of representation and amended Art 81 sub-clause (b) to read.

'There shall be not more than one member for every 500 000 of the population

Constitution (Third Amendment) Act 1954—Powers to control certain essential goods were transferred to the concurrent list and Centre's power to control the specified essential commodities were placed on a permanent footing Entry 33 of List III in the Seventh Schedule has been amplified.

Constitution (Fourth Amendment) Act 1955

It amended Article 31 which now provides for compensation for compulsory acquisition of property by the State The Article 31 A empowers the State to take over under State management for a temporary period a commercial or industrial undertaking or other property in the public interest or in order to secure the better management of the undertaking or property Temporary transference to State management is now permissible under the Constitution without payment of compensation as this does not amount to State acquisition of property

Constitution (Fifth Amendmnet) Act 1955 The Proviso to article 3 of the constitution has been amended as follows —

" Provided that no bill for the purpose shall be introduced in either House of Parliament except on the recommendation of the President and unless where the proposal contained in the Bill affects the area boundaries or name of any of the States specified in Part A or Part B of the First Schedule the Bill has been referred by the President to the Legislature of that State for expressing its views thereon within such period as may be specified in the reference or within such further period as the President may allow and the period so speified or allowed has expired."

Constitution (Sixth Amendment) Act 1956

It amends the Seventh Schedule by providing a new entry 92A in the Union List Taxes on the sale or purchase of goods other than newspapers where such sale or purchase takes place in the course of interstate trade or commerce and entry 54 of the State List follows 54 Taxes on the sale or purchase of goods other than newspapers subject to the provisions of entry 92 A of List I In Article 286 of the Constitution the explanation in clause (i) has been omitted For clauses (2) and (3) the following clauses have been substituted

(2) Parliament may by law formulate principles for

determining when a sale or purchase of goods takes place in any of the ways mentioned in clause (1)

(3) Any law of a State in so far as it imposes or authorises the imposition of a tax on the sale or purchase of goods declared by Parliament by law to be of special importance in inter State trade or commerce be subject to such restrictions and conditions in regard to the system or levy rates and other incidents of the tax as Parliament may by law specify

Constitution (Seventh Amendment) Act 1956 It came into force on Nov 1 1956 on which date India was organised according to this Act into 14 states and six territories

It gives effect to the States Reorganisation Act and increases the number of members of the House of the People from 500 to 520 and adds a new Article 170 which provides that the Legislative Assembly of each State shall consist of not more than five hundred and not less than sixty members chosen by direct election from territorial constituencies in the State The ratio of population to members to be elected is also abolished

The total number of members of a State Legislative Council shall not exceed one third of the total number of members of the Legislative Assembly of the State

High Court Judges are permitted to practise after retirement before the Supreme Court and the other High Courts (except the one in which they held the judicial post)

Same person may be appointed as Governor for more States

Special General Knowledge Supplemant see after Page 257

tongue is a dialect of Hindi will have the clock set in their favour, and for the South it will be a setting back of the clock by a hundred years" The argument of Rajaji boils down to this The Southerners have to read their own mother tongue (state language) as well as Hindi while the Northern people have the advantage to read only Hindi which is also their mother tongue This is an argument based on advantage and convenience of an individual and have nothing to do with the language itself Rajaji should not forget that Hindi was adopted as a national language because it was the language of majority of the Indians In adopting a national language, the convenience of majority is always kept in view and the minority have to learn that language Even in Britain, English is the official language though there are large Welsh and Scotch minorities having their own languages In Russia, every federating State has its own language but Russian is the official language Even in China with a population of over sixty crores and many varieties of dialects the Chinese spoken and understood near Peking is the official language

Mr Frank Anthony leader of the Anglo Indian Community has taken a somewhat similar line of argument as that of Rajaji against Hindi Addressing the annual general meeting of the All India Anglo-Indian Association in Delhi on October 27 1957, Mr Anthony said English is as much an Indian language as any of the other languages of India since it is the mother tongue of a recognised Indian community English is the last remaining bond of emotional integration in the country as it is the only means of communion of ideas between leaders of the country Whatever emotional reasons Mr Anthony had for retention of English are not to be argued about by anybody but when he went on to smudge Hindi it becomes clear that the hatred of Hindi rather than the love of English was uppermost in his mind Mr Anthony added Far from being a symbol of unity the new Hindi has become increasingly a symbol of disunity of the new language imperialism and also a symbol of the suppression of the regional and minority languages 'The imposition of Hindi will not only give a gratuitously unfair advantage to Hindi speaking students but would virtually cripple the chances of non Hindi-speaking students in the matter of employment opportunities. In judicial field the imposition of Hindi would lead not only to chaos but to the position of Hindi would relegate non-Hindi-speaking people to the position of inferior citizens.

Imaginary suspicions and fears are no arguments against Hindi and nobody will be convinced in favour of English by such paltry and trivial statements Of course there are eminent educationists and statesmen who have put forth genuine arguments for retention of English for some time to come" until Hindi attains the high standard of a universal language

Speaking at the Surat Rotary Club on September 27 1957 Sri K M Munshi former Governor of Uttar Pardesh said English should not be neglected or discarded as long as an alternate language has not been developed to its level of accuracy and precision so as to assume the place of English all over the country The neglect of English has led to the lowering of the standard of education.. The removal of English in a hurry is leading to parochialism and linguism. ..To neglect English, before Hindi is developed is to invite disaster and encourage an atmosphere that helped Allauddin Khilji to conquer the country"

Addressing the sixth annual convocation of the Gujerat University at Ahmadabad on October 5, 1957, Sri K.M Munshi said: English language has been the medium of expression and exchange of ideas between the people of different regions and states in the last 150 years It will be rash to conclude that Hindi can replace English in such a short time as is believed. The national language has to be evolved and enriched so that its adoption by non Hindi population will not create a problem Hindi should be made a perfectly expressive medium able to meet the needs of the people in all parts of the country before it is put in use as the national language"

Mr C.P.N Singh Punjab Governor said on October 5 1957, at Sanawar : "English as a language has plenty to teach us and we shall be spiting our own face if we turn our back on it

Mr C.D Deshmukh Chairman of the University Grants Commission said at Sholapur on January 10 1958 We should not make undue haste in prescribing regional language as medium of instruction as there is no regional language which has developed to the extent to replace English All the same English cannot continue as medium of instruction for an indefinite time and we shall

have to make a beginning in course of time by using regional language He added that even though a regional language was introduced as medium of instruction students would be well advised to learn English as an optional subject for its store of knowledge

Advancing various reasons why English a foreign language should be given the recognition as India s *lingua franca* Gen Cariappa former C-in C of India, said in a statement issued in New Delhi 'English is being spoken by more and more people throughout the country Some of the finest literature in the world and thousands of books on science in all its aspects and ages including books on atomic and nuclear subjects are mostly written in English We have been studying and do study these books and I hope will continue to do so in this language for the good of India and the world

The arguments for the retention of English as a national language are mostly based on its value and richness as a medium for international commerce and its vast vocabulary of scientific and technical terms But English is not the only language for the advancement of science Russia and Germany are the two countries most advanced in science and both have their own national languages Given sufficient time to develop Hindi can also attain the same standard as Russian German or French languages

English has taken centuries to develop and attain its modern standard It has borrowed words from every language of the world. Wherever Englishmen went they borrowed words from the language of the people of that part of the world There are more than a thousand Indian words which are properly anglicized English has also profusely borrowed from European languages Hindi can also borrow words from other languages and enrich its vocabulary No language can prosper which is conservative and narrow bound Hindi will have to adopt scientific and technical terms from other languages to be useful and able to replace English

English is not the mother tongue of any part of India It has to be learned in schools Compared to this Hindi is the mother tongue of 42 per cent of Indian population Why should one grudge a natural advantage to a considerable part of our population ? When the non Hindi people would shed their illusory fear of domination by Hindi speaking people and try to learn Hindi which is an Indian language as well as our national language, they will find it more convenient and easy to learn Even Rajaji the great exponent of English as our national language, is not against learning of Hindi Writing in the Hindustan Times of January 3 1958 Rajaji said If anyone advises the people of the South not to learn Hindi he s doing a great dis service to them I have made it clear and do so again, that I want all boys to learn Hindi We ought to learn the languages that will help us in increasing measure our trade and our intercourse with our neighbours Hindi people are our biggest neighbours and it will pay to learn Hindi I insisted on this 40 years ago and ever since and I insist on it now as much as ever before There is another baseless fear prevalent among educated people that when Hindi will be finally adopted as official language in 1965 as stipulated by our constitution English shall no more be taught in schools This is not the case English will continue to be taught in schools and every body will be free to learn it as a second language, Speaking at the 63rd session of the All India Natonal Congress at Pragjyotishpur Mr Nehru also emphasized the need for English to continue He further said that any kind of change over from English to Hindi should be gradual and flexible Mr Nehru added I am partial to English I want the study of English not only to continue in India but want it to become more widespread in the country But I cannot conceive of anybody saying that English is a national language of India It is beyond my comprehension To say that English is a national language is against the truth It is a matter for consideration how long we use English or that for practical reasons let us use both English and Hindi Explaining further the position of English in future Mr Nehru said English may be used as long as it is convenient to use it We have profited by learning English in many ways I admit that English has been a link between the different parts of India in the past I don t deny the utility of English Nevertheless the fact remains that the coming of English has meant much difference—it has separated English knowing people from the non English knowing people This has led to a new class—the English knowing class However much we want to spread English in India—because we want to keep in touch with the outside world—we cannot get that intimate feeling which we have out of our languages—Hindi Tamil or Panjabi These have the same cultural background linguistically the same metaphores, the same similes hundreds of

things are common. I foresee a period—an overlapping period when Hindi may be used and English is also used and in any event at any time the use of English or any Indian language cannot be tabooed." Mr. Nehru summed up: "English is bound to be used for a considerable time. After that it will be in alternative use (with Hindi) and after that too so far as I am concerned it will be allowed to be used."

Not only Mr. Nehru struck a cautious note against the haste in changing over from English to Hindi but earlier the report of the Committee appointed by the University Grants Commission and headed by Pandit H. N. Kunzru laid special emphasis on the need for avoidance of undue haste in changing over the medium of instruction from English to the various Indian languages in the universities. The Committee recommended that the medium of instruction at the University level should be changed from English to any Indian language only after careful preparation. Even after the change over is made the committee said that English should be studied by all university students and that there should be special emphasis on proficiency in English for those students who wish to pursue higher studies in the universities.

At the conference of India's Education Ministers held in Delhi in September 1956 Maulana Azad said that the change-over from English to Hindi should not be sudden. It was a challenge of the times that English should be kept a compulsory subject. English should also be kept as the medium of instruction in the universities for some time more. A sudden change in the medium would be ruinous to educational standards.

Inaugurating the all India Urdu Conference in Delhi on February 15, 1958, Pandit Nehru declared that English could never take the place of the national language of India. He said he was all for study of English as a vehicle of international importance but the proposition that it should become the national language could never even escape his lips.

Nothing could be more humiliating than to make English which is spoken only by one per cent of the people our national language. It is further degrading to our national pride to retain English as a medium of instruction for an indefinite time. Retention of English will only perpetuate the plutocracy of the English knowing people in India and hinder the emotional integration and national progress of the country. English, a language which is understood by one percent of the people and by not more than six percent of the literate population, cannot serve as the official language of the country.

English can never claim the place of Hindi. The very fact that it represents a culture other than Indian speaks volumes against its adoption as our national language. Change over to Hindi as official language sooner or later is inevitable as Hindi is the most suitable Indian language for this purpose. It is not only necessary but also inevitable that some day an Indian language will have to take the place of English. It has to be Hindi not because it should be but because no other language is *more suitable*. Hindi having a large number of words common to all Indian languages and particularly having a common system of syntax and idiom can be learnt by an Indian much more easily than English. The study of any language other than one's own can hardly be easy. There is every reason to believe that the people of non Hindi states will find it easier to learn Hindi rather than English. When once it has been decided to have Hindi as our national and official language let us take pride in it, learn it, enrich it and make its standard so high that it may take the position of one of the world wide languages.

READING FOR THINKING

By J. HARLAN SHORES
University of Illinois

THERE is no reading without thinking Perhaps all of us have at one time or another read a few pages and suddenly realised that we knew nothing that was there We recognised all the words but our minds were with something else This waste of time is not reading This is not the skill that all parents and educators want for children Reading involves understanding interpretation and evaluation and these are thought processes

So one can think without reading but one cannot read without thinking Or to put it another way reading and thinking are inseparable when the printed word is involved in the thinking

Speed and Comprehension

Probably only those who have worked with it closely for a long time even begin to realise how extremely complicated the reading process is It includes all the skills and abilities involved in thinking as well as those related to the learning and use of printed symbols Consider for a moment just a few of the factors that may help to determine how rapidly you read and how well you comprehend Some of these are directly related to the physical characteristics of the material size of type type style blackness and sharpness of print, quality and tone of paper size of page organisation on the page amount of white space kind of illustration placement of illustration on the page, relations of illustration to text headings and subheadings and overall organisation and design

Other factors that may affect speed and comprehension are related to less tangible aspects of the material the clarity of the writing the field of knowledge from which the writing is drawn the complexity of the ideas being developed the author s style and choice of words the kind of writing (poetry narrative description etc) the rapidity with which ideas follow one another and the extent to which ideas are fully developed

Still other factors that determine reading speed and comprehension are directly related to the reader his personality and his environment while reading how he feels (whether he is sleepy alert healthy ill calm nervous relaxed, tense etc.), what he has on his mind his emotional stability his vision whether he likes to read his mental abilities his reading skills his ideals his biases his prejudices his freedom from distractions All these and many more he brings to his reading job and each may help to determine how he reads

But most important of all to both reading comprehension and speed are those factors that relate the reader to the material he is reading the background of experience he has for this material his purpose for reading it, his interest in this field and especially in the part of it about which he is reading his mental set with respect to this job and to this material his familiarity with the peculiarities of style and phraseology of this author and this field whether these new concepts are compatible with or contrary to those he already holds in this field

It is impossible to say which one of these or the many other factors that may affect a person s reading is most crucial in reading for thinking For any one person nearly any one of them could play a major role A child who can t see well enough to distinguish the word forms can t read The emotionally upset child may not be able to read or think until his emotionality is more stable The person with strong prejudices may not even be able to understand an opposing argument A person with no background for his reading is imagining meanings The reader with no purpose in mind collects trash and jewels alike and often doesn t know one from the other

While all these factors must be recognised as real determinants in the reading process and none can be overlooked as clues in the improvement of reading and thinking a few must be singled out for special attention not because they are more important in the reading development of any one child but because they are more central to the thought processes of reading for all children and adults

What one gets from reading depends heavily upon what he brings to it Without adequate experience background for a passage adequate comprehension is impossible Perhaps this is easiest seen in its extreme If the reader has no meanings in his experience for words he sees there can be no understanding no interpr tation no evaluation In fact there can be no thinking about these words except

perhaps vague wondering of what it is all about

A most important part of reading and thinking about that which is read must depend then on earlier experiences And the amount and kind of comprehension including of course the amount and kind of thought is very dependant upon this earlier experience It would be a grievous error to think experience limiting comprehension in an all or none manner On the contrary, it is a continuum in a web of partial understanding, partial conceptions and partial abilities to see and use the concepts developed in the passage

Meaning

A high school boy was asked to develop the meaning of the often quoted lines from Scott s *Lady of the Lake* Th stag at eve had drunk his fill Where danced the moon on Monan s rill To him the meaning was fairly clear "A fellow without a date had drunk all he could hold at a tavern called Monan s And the moon was shining on the tavern or may be it meant they were selling moonshine there This meaning undoubtedly is not Scott s and is different from th picture you or I might bring to these words But it is unfair to say that he has not comprehend d Have you and I understood these lines when we have different mental p ctures after reading them? Have the other students understood Scott s passage when one thinks of a rill as a hill and another as a valley on the moon? Has a child no comprehension of the roundness of the earth when he thinks of it as round and flat like a coin? Is the boy who put Scott s stag in the tavern any farther off than the boy who has never left the plains when he reads about the Alps? Or the boy from the tropics when he reads about snow? Or I when I read about protons and neutrons?

The point of course is that words are symbols to stand for something and what they bring forth depends on the experience of the person doing the reading If we want these symbols to have exact meanings as they can with precise definition then we must build exact experiences behind them The time to learn what [illegible] means is not while reading the word but while learning about it And in this instance the meaning is probably easier developed by demonstration observation and experiment

A [illegible] programme of learnings at home and at school and a good reading programme are not different things They are two sides of [illegible] When [illegible]

of a chemistry lab in the basement or a few seeds in a flat box or an active science programme, at school the rich backgrounds of meanings are being developed that must be there if the reading of science is to provide the understandings int rpretations and evaluations that make reading a thinking process.

Purpose

While the reader s experience background provides a basis for comprehension and thought the reader s purpose sets the conditions for doing the job efficiently How fast does a good reader read? What does the good reader comprehend? How does the good reader think while reading? These questions don t have good answers because they are foolish questions When such questions are asked the reading process is not understood, for the extremely vital role of the reader s purpose has been forgotten

Would we ask a carpenter how fast he can build? Or what he keeps in mind while building? He would think we had lost our minds. What is he building? What are the specifications? For whom is he building? To what use is the building to be put? If we answer these questions he can answer the first ones

So it is with reading If the reader knows that he is reading, and for what purpose he is reading he can then tell us how rapidly he can do the job what he plans to get from it and how he intends to do it.

A good reader may cover material at a thousand words a minute and do an excellent job if all he wants is a general idea of what the passage is about He may cover the same material at fewer than a hundred words a minute and also do an excellent job if he now wants to recall all the ideas of the proper sequence and relate them to another [illegible] that he has in mind from another book. He is using different reading skills during these two readings and he is using them efficiently in both instances The difference of course is in the job he set for himself It is a difference in his purpose for reading

The reader who can read only to recall facts is as handicapped as the builder who can build only tool sheds Neither of them has the skill in command to be able to vary their techniques to the requirements of the task the inexperienced workman has only a few tools and a few skills in the use of these He spoils his product by using these few tools and skills where others are required The inexperienced reader whether he is a child learning to read or an adult learning to read well bungles

the job in much the same manner and for much the same reasons He lacks skills and he often uses those he has for inappropriate purposes

Examples of inefficient reading related either to unclear definition of purpose or to inability to use the skills that fit purposes are almost too common to single out There is the student who can't understand why he did poorly on the test when he read the material seven times There is the person who reads a novel as if it were a textbook He has memorised all the insignificant facts surrounding the story and now complains that he hasn t time to read as many novels as he would like And there is the person who pages through a book looking for a fact without trying the index or table of contents

Practice

To improve the efficiency of skills whether they be in reading drawing computing carpentering cooking golfing fishing or something else requires practice Fortunately, much of this practice both in school and out can be had while doing the job And fortunately too those jobs where inefficiency steals the most time and effort are those that we find ourselves doing more frequently These then get the most on the job practice In addition, of course deliberate practice sessions can be scheduled

At this point it cannot be overemphasised that just any kind of practice won t do Wide reading is no panacea for reading inefficiency The practice must be directed toward the inability Practice materials must be carefully chosen to develop the skills needed to read for a particular purpose If a reader is fairly efficient in scanning a passage for a pertinent fact but has great difficulty reading a passage to select the central and subordinate ideas there is no great need for him to practice scanning for a fact but there is real need for practice in reading to select the central and subordinate ideas

Home remedies without a complete and professional diagnosis are probably as ineffectual or even dangerous to educational growth as are such remedies to physical health And this probably is especially true in as complicated an educational area as that of the improvement of reading and thinking For even though an attempt was made here to indicate something of the complexity of these processes space permitted only a very partial coverage

Learning to Think

the reading process Learning to think surely is as much a part of reading and thinking as is learning to read Yet with these dangers of oversimplification clearly in mind a few things to keep in mind in order to improve reading and thinking might be as generally good as a warning to get plenty of sleep eat nourishing food and drive safely If these few simple guides to better reading are of any value they are probably as applicable to the teaching of reading beyond the primary grades as they are to the improvement of adult reading habits

1 Probably the first question the good reader answers for himself is What am I reading for? What do I want from this material? This sets the task and enables efficiency if his knowledge and skills are equal to it

2 Once he is into the material he should be sure that he is understanding well enough to satisfy his reason for reading If he is reading for fun the only test is whether he is enjoying himself But if it is a work type job the concepts needed for the job must be understood This judgement may send him to easier material or to related background materials It may even require some first hand experience to make the material meaningful But whatever it takes there is no substitute for enough background knowledge to give meaning to the verbal symbols

3 While he is reading the good reader is always partially aware of his reading skills He is enough aware of them so that he recognises at once when the skills he is using aren t the most efficient ones he might use He then shifts them with changes in the material or with changes in his needs

4 As he plans to improve his reading he probably would gain more by turning his attention first not to himself and his reading abilities but to the reading jobs required of him Why do I read? For what purposes do I read? Or in the classroom—For what purposes do the children in my room read? For which of these purposes is practice needed?

5 Once he has located the kinds of reading where he needs practice, he might ask whether there is any reading of this kind that he needs to do or wants to do If he can accomplish a real job while practising so much the better In any instance the content learnings which in this practice are of secondary importance to skill development should be worthwhile in themselves

perhaps vague wonderings of what it is all about

A most important part of reading and thinking about that which is read must depend then on earlier experiences And the amount and kind of comprehension including of course the amount and kind of thought is very dependant upon this earlier experience It would be a grievous error to think experience limiting comprehension in an all or none manner On the contrary, it is a continuum in a web of partial understanding, partial conceptions and partial abilities to see and use the concepts developed in the passage

Meaning

A high school boy was asked to develop the meaning of the often quoted lines from Scott s *Lady of the Lake*, 'The stag at eve had drunk his fill Where danced the moon on Monan s rill To him the meaning was fairly clear A fellow without a date had drunk all he could hold at a tavern called Monan s And the moon was shining on the tavern or may be it meant they were selling moonshine there This meaning undoubtedly is not Scott s and is different from the picture you or I might bring to these words But it is unfair to say that he has not comprehended Have you and I understood these lines when we have different mental pictures after reading them? THE TWO VISIONS

By BERTRAND RUSSELL

Bertrand Arthur William third Earl Russell 86 next May, iconoclastic descendant of the landed aristocracy and political ruling class of Victorian England is one of the original thinkers of our age Famous first as a mathematician he was imprisoned and deprived of his Cambridge Fellowship for conscientious objection in the First World War, and personally impoverished by giving away—from Socialist principles—most of his inheritance His 'The Theory and Practice of Bolshevism' published in 1920 when Communism had ruled Russia for barely three years was republished unaltered in 1949 as a powerful indictment of Stalin's dictatorship Lord Russell delivered the first Reith Lectures the latest of which (by George Kennan) he discusses in the accompanying article He was the Nobel Prize winner for Literature in 1950

EVER since the atom bomb was dropped on Hiroshima it has been evident that the world was moving into a new era of unprecedented peril The peril was obvious but the methods of dealing with it were such as to offend old and deep-seated prejudices Down to the present day mankind as though made mad by envious gods has continued to travel along the road towards ultimate disaster When sane policies have been suggested, one side or the other has rejected them

While America had a monopoly of nuclear weapons the United States Government proposed the Baruch Plan, an admirable and generous scheme which could have led to general security But, at that time the Soviet Government smarting under inferiority in this field felt that there would be a loss of face in adopting an American scheme Now while Russia has a (probably temporary) advantage, American *amour propre* has become an obstacle to international conciliation

Common Danger

The habit of thinking in terms of national advantage is so ingrained everywhere that schemes for lessening the tension are examined not by their suitability to this end, but by the incidental advantages that they may confer upon the Communist States or upon the West It seems to be beyond the power of statesmen to grasp that the danger is not to this or that nation but to the human race as a whole—Communist anti Communist and uncommitted nations in equal measure

It is obvious to every thinking person that the only long term solution is an international Government with a monopoly of the major weapons of war But at the moment matters [illegible] thing must be done, and done quickly if the human race is to have any security of survival during the next twenty years

There are hopeful signs which make it irrational to think that such palliatives [illegible] be adopted I think all friends of sanity [illegible] heartened by Mr George Kennan's Reith Lectures expressing as they did, not the v[illegible] of a theoretical pacifist or of any kind [illegible] crank but of a sensible man with a w[illegible] experience of affairs and an extens[illegible] knowledge of history I think, also—thou[illegible] here many people in the West will not ag[illegible] with me—that recent statements by M[illegible] Bulganin and Mr Khruschev together wit[illegible] the Resolutions of the Supreme Soviet show willingness to negotiate on a basis which [illegible] would be possible for the West to accept I d[illegible] not mean that their proposals as they stand are adequate What I do mean is that, [illegible] they were faced by Western proposals no more biased in favour of the West than the Russian proposals are in favour of their *bloc*, the gap between the two groups of proposals would not be insuperable and amicable discussion could lead to a compromise acceptable to both parties

Governmental Folly

It is customary in the West to reject al[illegible] Russian proposals as insincere and no[illegible] worthy of detailed examination There is o[illegible] course a risk in regarding them as sincere But what is the nature of this risk? The ris[illegible] is often thought to be that of Communist victory when in fact it is only that we ma[illegible] suffer some diplomatic setbacks which a mor[illegible] implacable attitude might have avoided I[illegible] this risk comparable to that of continue[illegible] enmity between the Communist States and the [illegible]

stumble into world war inadvertently ? It seems to me that statesmen have shown themselves during the past twelve years totally incapable of judging which of two risks is the greater when one or the other must be incurred This folly has been shown by he Governments both of the Communist States and of the West sometimes more by the one and sometimes more by the other

If the deadlock is to be resolved both sides will have to realize that their common interests, especially the survival of their citizens far out weigh the interests in which they compete and I should wish to see a Summit Meeting on this new basis It is clear that neither side can achieve world dominion and that continued hostility can lead to nothing but common disaster It is not useful even if it were true to say that the other side (whichever that may be) stands for something evil and that it is our duty as crusaders to combat it by force of arms if necessary

Essential Steps

When I say this I do not mean that we should abandon our convictions or cease to advocate them by such methods as we should use in home politics Most of us at home favour either the Conservative or the Labour Party but we do not favour the use of nuclear bombs to give the victory to the party which we prefer The deadliness of modern weapons has made it imperative to conduct the controversy between Communists and anti Communists by the methods of peaceful propaganda and not as hitherto by threats of vast destruction.

What then are the immediate measures that could produce a *detente* during which a more lasting improvement could be sought ?

The first step must be to stop the rapidly increasing danger of H bomb devastation While America and Russia alone possessed these weapons, it was much more possible to hope for an agreement limiting or abolishing their use than it will be when practically every sovereign State is able to threaten mankind with extinction and to use the threat for purposes of blackmail But if present trends continue we shall have reached this condition within a few years

The British for what I cannot but regard as frivolous reasons o national prestige have embarked upon the manufacture of these evil things So long as they persist in this policy, they cannot effectively oppose similar measures by other countvries and when the adoption of such measures has become general it will be far more difficult than it is at present to control the manufacture and use of nuclear weapons by all and sundry

I should wish to see British policy in this respect reversed—if possible by a general agreement but if that should prove impossible then unilaterally It would then be possible for our Government to oppose the spread of nuclear weapons to countries which do not at present possess them

No Deterrent

It is an almost unimaginable folly to suppose that by manufacturing H bombs we increase the security of our country We do in fact the exact opposite both because we encourage however reluctantly the manufacture of these weapons in countries which may be hostile to us and because we make ourselves a target in the event of war breaking out The argument that our bombs would act as a deterrent is not one which will bear examination America and Russia already offer a complete deterrent except to lunatics but unfortunately history and even very recent history shows that power may easily be in the hands of lunatics And apart from deliberate acts of Governments there is always the danger of an "incident which is misinterpreted under the influence of excitement and leads within an hour or two to a universal holocaust

I do not think that any Government has adequately assessed the risk At the present moment the Soviet Government seems more anxious to diminish the risk than do the Governments of Britain and the United States But even the Soviet Government in its most conciliatory moments seems to be still the victim of make believe Mr Khruschev in otherwise friendly communications points out the destruction that Soviet bombs could wreak in Britain He seems to have forgotten that the prevailing winds throuchout Europe are westerly and that the fallout from Soviet bombs dropped in Britain would probably be disastrous to Russia I think it important that facts of this nature should be realized by all Governments since their realization will facilitate a general move towards conciliation

Problem of Germany

If *a detente* is to be achieved it will require the consideration of many questions in addition to the control of nuclear weapons I do not know what steps if any will be taken towards this end What I should like to see as a first step would be a frank discussion between

the United States and the U.S.S.R. not with a view to reaching binding decisions but with a view to exploring the possibilities of a compromise policy giving no net advantage to either party.

If such a policy could be found I should wish to see it recommended by its sponsors to the other Powers of N.A.T.O. and the Warsaw Pact. It would necessarily be a policy different from those hitherto advocated by either side. Take, as the most important example, the problem of Germany. The West has contended that Germany should be unified and remain a member of N.A.T.O.; Russia on the other hand has shown no willingness to allow Eastern Germany to free itself from Communist domination. If the problem of German unity is to be solved both Russian and Western interests will have to surrender something. If war is ruled out, the surrenders on the two sides should be roughly equal.

The same sort of thing applies to disarmament. Year after year proposals have been brought before the Disarmament Conference which were not really intended to lead to an agreement, but only to seem to the world to show goodwill. The proposals were always such as would be [illegible] by the side that made them. It will be necessary, if [illegible] is to be achieved, that proposals should be made with a genuine desire to reach agreement and [illegible] the expectation that the other side [illegible].

Neutral Zone

I cannot but think that in working out the compromise solution neutral opinion could with advantage be consulted. I do not wish to suggest what the solution should be but only that there should be a solution and that the two sides should meet with mutual determination to reach an agreement no unfair to either party.

An almost immeasurable step towards permanent conciliation would result from the adoption of the scheme for a neutral zone which has been endorsed and powerfully advocated by Mr. George Kennan. I do not think there is much sense in the recent Soviet suggestion that such a zone should be freed only from nuclear weapons. If it is to serve its purpose it will have to be freed from all alien armed forces and [illegible] to neutrality in any conflict between East and West. I should like to see it [illegible] see the whole of cha[illegible]

[illegible]

Germany as well as Poland, Czechoslovakia and Hungary. When other European Powers are sufficiently confident I should be prepared to see them included when the time will come.

Such a measure would entail loss to Russia through the liberation of satellite States and to the West through the relinquishment of [illegible]. These two losses could roughly be held to [illegible] either side [illegible] it is certain that each would [illegible] a gain to mankind. Such a measure, if it could be adopted, would make coexistence between the two blocs immensely less difficult than it is at present.

The Alternatives

Hope, quite as much as fear, should be the moving force urging the adoption of some such policy as I have been suggesting. We have it in our power through the resources of science, which are now in large part so sadly misused, to create a world far better and far happier than any which has existed in the past. Poverty could be abolished; the dread of disaster which now paralyses thoughtful men could be ended; and creative abilities could be freed for human achievement and not for destruction. Before very long war could come to be viewed as we now view cannibalism which once was equally universal. In moments of hopeful vision I see men throwing off the shackles of ancient fears and [illegible] welcoming the recognition that the [illegible] is the welfare of all and that [illegible] an [illegible] another [illegible] future [illegible] that is [illegible] there [illegible]

INDIA'S NATIONAL LABORATORIES

By Prof M S THACKER

INTEREST in science is on the increase in India There is a growing awareness on the part of industrial enterprises of the potentialities of scientific research which has gained considerable impetus from the em phasis on industrialization in the Five Year Plans

It is nearly a decade since the earliest of these national laboratories was established The first phase of construction equipment and staffing having been successfully completed the laboratories have directed attention to research projects oriented towards the national development programmes The Directors and senior officers of the laboratories are closely associated with the various technical commit tees of the Planning Commission and Deve lopment Councils

Blue Prints For Industrial Projects

Attention is being paid not only to develop ment of research results but also to the pre paration of blue prints for large industrial projects such as the planning and execution of the Durgapur Industrial Project in West Bengal and the supply of investigational data for the South Arcot Lignite Utilization Project.

The laboratories have carried out consi derable basic research which has potentialities for industrial application but I shall select only those results which have an immediate bearing on economic development as for ins tance those concerned with fuel and mineral resources leather glass and ceramics chemi cal food and drug industries

Surveys and Assessment of Natural Resources

Any assessment of the achievements of the laboratories should take into account not only the inventions leading to improvements in industrial processes and products but also the large and varied investigations undertaken and the technical assistance rendered for the ex pansion or improvement of existing industries Under this last category come the surveys and assessment of the natural resources which constitute the raw materials of industry

The extensive and systematic survey of the coal resources of the country besides helping coal producing and coal consuming industries has led to the discovery of large reserves of coal for coking and blending For example, No 1 seam in the Jharia coalfid has a reserve of about 400 million tons of coking coal while in respect of reserves of coal for blending with coking coals those in the Jhilimilli coal field in Madhya Pradesh have been found suitable for blending to the extent of 40 per cent in the blend

The survey has also revealed the possibility of producing good metallurgical grade coke from coals hitherto considered unsuitable for the purpose for example semi coking Raniganj Measure coals in the Raniganj coalfield

These results are of great importance in the context of the facts that India was thought to be poor in coking coal resources, and that more and more coking coal will be required for steel making in the years to come

Surverys of glass making sands and ceramic raw materials such as clays and talcs high calcium limestones aromatic plants of Jammu & Kashmir and rose growing areas have also provided useful data for industrial develop- ment

Mineral Industry

The iron and steel industry is the most important industry under development in India today Of the estimated coal reserves of the country only a fraction is of the truly coking variety useful for carbonisation to metallurgical coke Further the occurrences of good coking coals are largely concentrated in Bihar in and around the Jharia field and this has added to the problem of location of steel plant even though other raw material namely iron ore limestone etc are more widely distri buted.

Investigations carried out under the auspices of the Council of Scientific and Industrial Research have shown that it is possible to extend the coking coal resources considerably One approach is to examine the possibilities of blending weakly coking coals in suitable proportions with good coking coals Yet another method of dealing with the problem is to upgrade the coals by washing

Systematic investigations on the possibilities of various types of coals have disproved the earlier view that Indian coals were not amen able to washing By judicious processing in

coal washeries, it may be possible not only to provide the coals required for the iron and steel industry but also to obtain products utilizable for the generation of power and the manufacture of fertilizers and chemicals

Based largely on researches of the Council, three large coal washing plants are in operation and two others are nearing completion It has also been shown that it is possible to process certain high-volatile and non coking coals of the Raniganj field for utilization in iron making

Impetus To Steel Production

Another aspect of steel production studied in the national laboratories is the L.D process Indian pig irons contain amount of phosphorus and have to be subjected to treatments in two successive stages for converting them to steel It has been shown that refined steel can be obtained from pigs by a one stage treatment

A pilot low shaft furnace with a capacity of 15 tons per day is under erection for study ing iron and steel production by the use of non coking and other inferior coals Useful studies on the sintering characteristics of iron ore fines of Madhya Pradesh have been under taken at the National Metallurgical Laboratory Jamshedpur These fines, which are now wasted, can be processed and utilized for steel production

Noteworthy among the other projects studied at the Jamshedpur Laboratory is one relating to the replacement of nickel by man ganese in stainless steel manufacture A new process for the manufacture of such stainless steel has been developed

Studies directed to the production of refrac tories have shown that fosterite and sillimanite which are abundantly available in India can be profitably utilized Graphite crucibles of good quality have been made from Indian graphite and are found suitable for use in the foundry and other industries

Design modifications for vertical boilers have been suggested which can operate on low grade and small coals or washery middlings and rejects

Investigations on the beneficiation of low grade ores have opened new possibilities for the conservation and efficient utilization of ores Valuable work has been carried out at the National Metallurgical Laboratory on the up-garding of manganese ores, chromite, wolfram pyrites etc.

Based on the investigations on graphite beneficiation, a plant for the production of commercially useful graphite from low-grade ores has been set up at Titilgarh in Orissa.

Work on the concentration of [illegible] bearing ores has also yielded useful results and a semi-commercial plant has been set up Ghatsila in Bihar

Electrolytic processes for the production of high purity manganese metal have been developed A pilot plant, producing 32 [illegible] of metal per day, is in operation at the Jamshedpur laboratory

Chemical Industry

Many new processes and modifications to existing processes of manufacturing commercial chemicals, have been developed in the national laboratories For convenience they may be broadly considered under coal chemicals, electrochemicals, and fermentation chemicals

A water softening cation-exchange material developed by the Central Fuel Research Institute is now marketed in India and in European countries under the name 'Carbion' and has been found to be an efficient and economic substitute for 'permutit

The utility of carbion in conjunction with an anion exchanger for producing potable water from brackish waters has been established Trials in Rajasthan which are under way have indicated its potentialities for demineralizing water supplies A modification of this cation exchanger yields an industrial desiccant and dehumidifier

A new fluidized process for the manufacture of phthalic anhydride a valuable intermediate for dyestuffs manufacture has been developed The raw material employed is neutral coal tar and the cost of production is low

Smokeless Fuel

An economic method for the production of smokeless solid fuel for use in domestic hearths has been a pressing need in the country The heap burning as in the coalfields does not permit the recovery of byproduct chemicals and not only are these useful materials wasted but the atmosphere is seriously contaminated further the quality of the fuel produced is indifferent

Pilot plant trials carried out on different types of coals at Hyderabad and Jealgora have shown that domestic smokeless fuel can be produced with the recovery of by products at economic prices Market acceptance studies have indicated the superiority of the fuel over the soft cokes at present on the market.

Two catalysts for the removal of sulphur from industrial gases have been developed They find important applications in the synthetic chemical industry A gas adsorbent, under the name 'Lisasorb finds application in mine rescue apparatus Active carbons suitable for use as bleaching agents for vegetable oils and sugarcane juices have been obtained from lignite and non-coking coals

Among the more important electrochemicals developed mention may be made of manganese sulphate from low grade manganese ores and cuprous oxide used as an ingredient of anti fouling paints for ships bottoms of fungicidal compositions used in agriculture and of glass batches A process for the production of electrolytic manganese dioxide used in the manufacture of batteries has been developed Manganese dioxide also finds application in the decolourizing of glass in the production of coloured ceramic wares and in chemical preparations

A process for the production of nicotine sulphate an effective insecticide used in agricultural sprays has been worked out in the National Chemical Laboratory Poona The starting material is tobacco waste which is available in large amounts (about 28 million lb per year)

A commercial plant for the production of the insecticide is under erection at Guntur Andhra State Dicalcium phosphate containing 40 42 per cent available phosphorus pentoxide has been developed using Kossier rock phosphate and hydrochloric acid thereby effecting considerable saving in sulphuric acid consumption

Recent developments at the national laboratories of significance to the fermentation industries include the isolation of a strain of *Aspergillus niger* with outstanding ability for fermenting sugars into citric acid a process for the fermentative production of citric acid using this fungus and an improved method for the production of vitamin C from sorbitorl

More than 1 000 pure cultures of bacteria fungi yeasts and other industrial micro organisms are maintained in the National Chemical Laboratory for distribution to industry and research workers

Leather Industry

Contributions of the Central Leather Research Institute Madras to the development of the leather industry *have been many and varied* These include the improvement of raw hides and skins better utilization of indigenous tanning materials, production of leather auxiliaries industrial leathers, and *improvement of tanning techniques*

Common defects found in hides and skins such as salt stains and red heat have been traced to faulty methods of curing and preservation and techniques have been developed for eliminating them The occurrence of red heat is due to *Khari* salt used for curing goat skins consumption of this salt is valued at Rs 30 lakhs annually A salt mixture, formulated at the Central Leather Research Institute Madras has been found to be superior to *Khari* salt for curing and preservation of skins

Over a dozen indigenous substitutes have been found for wattle bark which is now imported at a cost of 17 lakhs of rupees annually A pilot plant is being set up for the manufacture of *tannis extracts from indigenous tan* barks preventing thereby wastage due to improper leaching

The Institute has worked out processes for the manufacture of synthetic tannins fat liquors, bates pigment finishes mineral tanning agents etc Fat liquors prepared in the Institute cost ten annas per pound as against Rs 1 75 the price per lb of the imported product, and they are being sold to tanners

Arrangements have been made for the *production on a pilot plant scale of synthetic* tannins and pigment finishes The production of these leather auxiliaries in India will lead to an annual saving of about two crores of rupees

The traditional E I tanning process employed for the production of kip is time consuming and costly The method has been modified to save both time and cost and the new process can be adopted by tanners without difficulty

Process for converting E I leathers to semichrome uppers suede leathers and clothing leathers have been evolved at the Institute and demonstrated to tanners Rapid methods for pit tanning of sole leather have been worked out their adoption will reduce the duration of tanning from 3 6 months to 3 4 weeks Processes have also been developed for the production of glazed kid

Small Scale Industries

In the field of small scale engineering industry the national laboratories have made *many useful contributions A process for the* production of silvered mica capacitors for use in radio receivers has been developed at the

National Physical Laboratory New Delhi and a pilot Plant is in operation

The possibility of manufacturing bricks of good quality from black cotton soils has been established by the work of the Central *Building Research Institute Roorkee* A hand operated brick making machine with an out put of 2,000 bricks per day has been designed The bricks are moulded from a mix containing low moisture and the finished bricks have less shrinkage than bricks made by the traditional process

A foaming agent for foam concrete has been developed this constitutes a distinct *contribution to cement economy* The new foaming agent is at present being utilized by the Hindustan Housing Factory Delhi

Another useful development emanating from the Central Building Research Institute is the formulation of a silicone containing wash which renders mud plaster and *kaccha* wall surfaces water proof

Field experiments on the stabilisation of black cotton soils for cheapening road construction costs have been successfully carried out by the Central Road Research Institute Delhi

At the Central Glass and Ceramic Research Institute Calcutta foam glass has been produced for the first time in India from indigenous raw materials *This light weight multi* cellular material has excellent heat insulation properties and good mechanical strength and it finds application in refrigeration and construction industries

Glass compositions free from selenium, for making red bangles have been formulated and factory trials have established its value to the bangle industry

The annual production of red bangles in India is valued at about two crores of rupees and the value of selenium imported for use by the industry is about fifteen lakhs of rupees per annum.

Among the results contributing to the development of the ceramic industry, mention may be made of the process for the manufacture of chemical porcelain from indigenous raw materials and enamel compositions free from borax Enamelware produced by the use of the borax free formulations has proved satisfactory

Nutritive Food Products

The Central Food Technological Research Institute Mysore has worked out a variety of processes for the conversion of coarse and second grade materials into acceptable nutritive food products Composite substitutes based on cheap indigenous materials have also been developed From tapioca a common tuber a macaroni product more nutritious than rice has been produced The necessary plant and equipment for processing the raw material were designed at the Institute A protein rich Multi purpose Food which can be used with advantage along with other foods to correct deficiences in proteins, minerals (especially calcium) and vitamins, has been formulated from ground nut flour and pulses

Proteins from tender field beans (Dolichos lablab) and black gram have been found to be effective in lowering the blood sugar level *Studies are in progress on the mode of action* of these proteins methods for the concentration of active principles and their possible application in the treatment of diabetes A protein hydrolysate useful for therapeutic purposes has been prepared from mustard and til oil cakes A laboratory unit for its production is in operation at the Central Drug Research *Institute Lucknow*

This survey of some recent research contributions from the national laboratories is by no means exhaustive It respresents a cross section of the results which have already found or will soon find application in industry The interest which industry has begun to take in the research activities of the laboratories augurs well for the future

THINGS THEY SAY

The brotherhood of mankind must no longer be a fair but empty phrase it must be given a structure of force and reality The nations must realize their common life and effect a workable partnership to secure that life against the aggressions of autocratic and self pleasing power

—*Woodrow Wilson*

* * *

If you have great talents industry will improve them if you have but moderate abilities *industry will supply their deficiencies*

—*Sir Joshua Reynolds*

* * *

It is the little worries that often fret one's health away Like little rains they annoy *Like drops of water by constant bombardment* on a massive work, they can inflict real damage.

—*Ed Podolsky*

ROLE OF PRIVATE AND PUBLIC SECTORS IN

INDUSTRIAL DEVELOPMENT IN INDIA

By MANUBHAI SHAH

(Union Minister of Industry)

THE process of industrialisation in all democratic countries has hitherto followed a more or less similar pattern the development of consumer goods industries setting off the process of expansion by creating a demand for producer goods the development of capital goods industries thus following in the wake of the increasing demand for machinery and equipment by consumer goods industries While the process of development has generally followed the above pattern the degree and intensity of industrialisation in each country has depended on the extent of development of a capital goods industry in that country The industrially powerful countries of the West are in general not only able to supply all the capital goods requirements of their own but they are also exporters of capital goods to industrially less developed countries In the increase in world trade which has been witnessed in the last two decades by far the bulk has been appropriated by countries able to export capital goods In the long run the industrial greatness of a country is thus intimately related to the capacity of a country to manufacture the machinery and equipment required for rapid industrial expansion

Process Reversed

Some of the newly developing countries have, therefore deliberately planned to reverse the process of history and to take up the expansion of a capital goods industry prior to the (more usual) expansion of consumer goods industries The U S S R was able thus to take a tremendous stride in industrialisation within the short span of a few decades and to cram into this period a degree of industrial expansion that took 150 to 200 years in the rest of Europe and America China too has recently started along similar lines Among democratic countries the first to experiment with this reversal of the normal process of industrial development is India

There have been good reasons why this process had not automatically been followed in the past in democratic countries Private enterprise has to work for a profit and indeed only thus can any allocation of existing investible resources be made by private enterpreneurs In a developing economy there is a large unsatisfied demand for consumer goods while investible capital resources are in short supply Available capital therefore naturally turns to those sectors where profits are quick and good and as long as the demand for machinery remains small, a domestic capital goods industry remains undeveloped

As we have seen quick and self sustaining industrial expansion requires a machine building industry which can supply the machinery and equipment required in the economy In a planned economy therefore it becomes necessary for the State to take over the leadership in the development of key and basic industries While some of these industries may not yield an immediate profit they provide the necessary momentum as well as the wherewithal in the economy for a cumulative growth of industries

Industrial Policy

This policy is underlined in the Revised Industrial Policy Resolution of the Government of India as announced in April 1956 According to this Resolution industries are to be divided into three categories (i) those where new units are to be the exclusive responsibility of the State although where existing private undertakings are allowed to develop (ii) those in which both the State and the private sector may participate but where the State will increasingly start new units and (iii) all other industries left to the private sector While Government investment in the last category is not precluded it is understood that this wide sector would remain generally open for private investment

The spheres where new units are generally to be the exclusive responsibility of the State are arms and ammunition etc. atomic energy iron and steel heavy castings and for

industrialisation and that this has been possible not only with the public and private sectors co-existing in the field of industry but that the impetus to private industrial investment is well provided by projects in the public sector not only through the generation of increased demand for consumer goods—which provides an immediate impetus to private investment—but also by ensuring the supply of equipment and raw materials necessary for private industry—which provides the necessary wherewithal for private investment. The public investments which have characterised the industrial programmes in the Second Five Year Plan have thus laid the foundations for the further industrial development of this country in the years to come and the intimate co-operation and co-ordination with which both the sectors are fulfilling their respective assignments are a happy augury for the future accelerated progress of our economy

6 Now as he begins to practise in his reading for a particular purpose he might turn his attention to his skills What is giving me trouble in this Job ? How might I do it faster ? What could I do to get it better ?

In Conclusion

That this is an oversimplified approach to the development of more efficient reading and thinking about that which is read cannot be denied A reading specialist could cite hundreds of aspects of reading ability that aren t even mentioned here He could also offer valuable help with any of the factors mentioned or discussed above It is therefore important to mention that this discussion was not intended as a guide for the diagnosis of reading difficulties or for the improvement of reading abilities

It was instead a brief consideration of some of the factors affecting reading and thinking and an equally brief group of suggestion that might form a general guide for the improvement of reading with respect to two of the most important of these factors—the experience which the reader brings to the page and the reader s purpose in reading

—o—

AFTER CARE HOMES FOR RESCUED WOMEN

A systematic attack on social evils in India may be said to date from the starting of the All India Social Conference in 1890 A D, although pioneering efforts were made earlier by persons like Dr D K Karve the late G.K Deodhar and Raja Ram Mohan Roy The work gained momentum with the establishment of the All India Women s Conference in 1926

The main work is undertaken by the Association for Moral and Social Hygiene in India In Delhi the Women s Protection League (Nari Niketan) set up in February 1950 as the local branch of the Association has restored 302 of the inmates to their parents or guardians given training or education to 66 and arranged marriages for 45

There are nearly 10 such rescue homes the first of which came into existence in 1908 In Bengal the All Bengal Women s Union has three homes under its management These homes as well as the Salvation Army Home and the Tendal Home have rescued a large number of women through marriage or employment

Parliament has supported and ratified the implementation of the International Convention for the Suppression of Traffic in Persons and the Exploitation of others Parliament has also passed the Suppression of Immoral Traffic in Women and Girls Act

Programmes of after-care which form an integral part of social welfare services under the Second Five Year Plan are being implemented throughout the country by setting up State homes and district shelters It is a programme directly administered by the State Governments with the State Boards playing the role of co-ordinators and advisors at the State level similar to the role played by the Central Social Welfare Board at the national level.

There is a provision of Rs 10.5 crore for after care and social and moral hygiene programmes in the Second Plan and the target is 80 homes and 330 district shelters (Rs 3 crore are provided in the plans of States and Rs 3 crore in the schemes of the Union Ministry of Home Affairs)

INDIA'S ROLE IN ASIAN SOLIDARITY

By Dr B G GOKHALE M A Ph D

EVEN after the withdrawal of British power from India Burma and Ceylon Western colonialism is still a factor in the life of South East Asia It is this fact that has conditioned India s attitude not only to Asia but also beyond it to Africa Indeed peace freedom and economic progress are the three major premises determining India s foreign policy Acting on these basic principles India has felt that she had a moral duty to use her good offices in the furtherance of any or all of these objectives in international relations especially in inter Asian relations

It was in this spirit that India championed the cause of Indonesian freedom in 1949 by convening a conference to consider the Dutch action against the Indonesian Republic This conference was an important land mark in the evolution of Indian South East Asian relation This conference was attended by 19 Asian nations who passed resolutions the general purport of which was to support the Indonesian case In a sense this conference was a prelude to the Bandung conference for the parties invited to attend this conference were selected on a more comprehensive basis than just Asian affinities The list of invitees included Afghanistan Australia Burma Ceylon Egypt Ethiopia India Iran Iraq Lebanon Pakistan the Philippines Saudi Arabia Syria and Yemen Of these 8 delegates belonged to countries outside South East Asia and one to Australia, though a Pacific Ocean nation is generally not considered as Asian nation

India also moved in the Security Council vigorously in the Indonesian case and as a result of Asian and U.S interest in the matter the Indonesian dispute was settl d and the Dutch power disappeared from the Indonesian scene Much before this there were close ties between Indian and Indonesian leaders and 1949 only further strengthened these

The formation of the Commonwealth Colombo Plan for the economic development of South East Asia and the establishment of a group of countries after the Colombo Conference in 1954 indicated another stage in the development of Indian South East Asian relations Through these years Indian contacts with the countries of South East Asia were strengthened by the visits of Mr Nehru to Burma Malaya and Indonesia and the return visits of the Prime Ministers of Burma and Indonesia to India These visits led to constant consultations mutually leading to the formulation of a somewhat similar foreign policy commonly described as one of dynamic neutrality This is possible only because of the climate of public opinion in India Burma and Indonesia favouring such a foreign policy

A Definite Shift

In 1954 Nehru visited China and on his way took advantage of his route through Indo-China to meet the leaders of Viet Minh and Viet Nam and also of Cambodia and Laos In his statement of March 21 1955 on a visit to India the Cambodian leader Prince Nordom Sihanouk stated that India had promised material and moral aid to Cambodia in preserving her independence and helping the country progress economically As this has not been contradicted it may be regarded as the first instance wherein India has given an explicit assurance to an Asian nation of aid the implications of which are obvious This promise of material aid to Cambodia has precedents in similar loans and aid to Burma and Nepal Especially with Nepal India s relations have been very close and this is but natural considering the fact that Nepal is right astride India s strategic frontier in the north east But the extension of a promise or an assurance to help in the preservation of independence to a state so farther away as Cambodia suggested a definite shift in India s policy in South East Asia

This becomes especially suggestive in the context of its timing as the assurance under reference was made shortly after the joint declaration by China and India of their acceptance of the five principles of mutual respect for sovereignty territorial integrity non interference in internal affairs co-existence of mutually differing social and economic systems and non aggression In a sense this assurance to Cambodia would mean that has clearly stated to the Pow any aggression ov... or bodia would be as India This

ment of consular agencies in Cambodia and later in Laos as well as in South Viet Nam and the Democratic Republic of Viet Nam or North Viet Nam

In this context the development of these peculiar relationships with Nepal and Cambodia on the one hand and Burma and Indonesia on the other points out an aspect of India s foreign policy in these areas, an aspect which has not yet crystallised in formal mutual aid treaties but all the same is of considerable importance Mr Nehru is against any military pacts, as these in his opinion create tensions instead of resolving them and personally favours conciliation and negotiation in the place of military or mutual defence pacts In his reading of the situation in South East Asia the probability of overt aggression is much less than that of internal collapse due to unstable economic conditions

Area Of Peace

So far the five principles have been officially subscribed to by India China Burma Nepal Cambodia Laos Indonesia and the Democratic Republic of Viet Nam and though these acceptances can have no formal forces as of treaties and alliances duly ratified as national and international commitments they have some validity as gentlemen s agreements Presumably the Five Principles are Nehru s answer to the challenge of the system of mutual defence treaties and agreements Whether this is a convincing answer to the world at large may be a debatable proposition But it should be realized that out of a total population of some 900 millions in South East Asia (including India Pakistan and Ceylon in addition to other countries in this region) some 500 million are already committed to this system of operative gentlemen s agreements In this therefore already as many as 71% of the population of the area is involved and committed This area of peace may wellnigh successfully hold the balance of power in South East Asia and prove in the ultimate analysis an important factor in the preservation of world peace

India s participation in the Colombo Plan and in the extensive aid programmes offered by the United States clearly indicate that India is implementing the economic demands of the foreign policy Her own Five Year Plan is designed to create the basis for further concerted efforts at economic rehabilitation of the country and in this effort opportunities of inter Asian co-operation are utilized. It was in this spirit that the Government of India recently invited a meeting of 13 countries of Asia to consider how best to use the foreign aid offered by United States This was in sequel to Mr Stassen s visit to India Reference has already been made to the economic assistance given by India with her limited means to countries like Nepal Alongside possible economic co operation India has set up or actively patronized several inter Asian cultural co-operation agencies In 1949 was set up the Indian Council of Cultural Co-operation with one section exclusively devoted to work in South East Asia Besides this there are many other organisations in the country actively pursuing a programme of closer cultural understanding between India and the countries of South East Asia Visits of Indian delegations to these countries and the frequent visits of Asian leaders to India considerably augment the work of mutual co-operation and strengthen the already existing ties of mutual friendship

Finally a reference must be made to the conference of delegates from 29 Asian and African countries at Bandung in Indonesia and India s part in it India was one of the sponsors of the confetence and the Indian delegation was led by Mr Nehru himself The purpose of the conference was to give an opportunity to representatives of Asian and African countries to come together and discuss common problems

As Mr Nehru explained to the Indian Parliament It had become a regular practice for the affairs of Asia to be determined by certain great Powers in Europe But now some importance is attached to the views of Asian countries because they cannot be ignored Nevertheless it seems to be the high privilege of the countries outside to carry the burden of Asia on their shoulders Decisions are made affecting Asia in which Asia has little say But it is obvious that things have changed

But the conference was not designed to be anti West It had a much more positive purpose than that As Mr Nehru put it it was designed to express the urge for peace freedom and progress felt all over the under-developed world of Asia and Africa and the resolutions passed at the conference merely prepared the framework for cooperation in political social, economic and cultural fields India from the very outset was keen on keeping controversial issues out of the agenda thus help secure the largest measure of agreement among the nations represented However, it was inevitable that in a gathering of the size and character re

(Continued on page 202)

WHITHER BASIC EDUCATION?

By Dr K L SHRIMALI

BASIC Education has undergone considerable change since the theory was first propounded by Mahatma Gandhi It is not a static system and therefore changes in the light of experiments and experience were inevitable One of the special characteristics of Basic Education which needs to be emphasized over and over again is the aspect of productivity In fact Gandhiji considered self sufficiency to be the acid test of Basic Education Through this type of education he expected that the recurring expenditure at least would be met by income derived from productive work But today nobody believes that the school children can provide for the total salaries of teachers through their work. It will however be wrong to ignore altogether the productive aspect of Basic Education Apart from its economic value, the productive work has social and moral significance In producing something that is useful to the society the child learns to become a useful member of the community and helps in the creation of a co-operative and non exploitative society Each individual member of the society learns to produce so that he may share the fruits of education and culture Basic Education is based on a sound sociological principle

At this time when we are undertaking programme of educational expansion we must remind ourselves that the productive aspect is an essential feature of Basic Education There is a general tendency among the educationists to accept the activity principle underlying this system but to neglect its productive aspect It must be made clear that Basic Education is not another name for what is called progressive education in the West The system of Basic Education has been devised to meet the special social and economic conditions of our people and the further needs of our society If the productive aspect which is the central feature of this scheme is relegated to the background we give up the whole position of Basic Education

Economic Aspect

Since Basic Education has now been accepted as the pattern of national education we shall have to examine its economic aspect carefully The basic schools require greater initial investment and better quality of teachers and therefore *per capita* expenditure in Basic Schools in most of the States is considerably higher than in the ordinary schools If expenditure on Basic Schools goes on increasing without proportionate income through productive activities this may ultimately stand in the way of further expansion of elementary education since the fund availble for the introduction of free and compulsory education are not unlimited

When the Report of the Central Advisory Board of Education on Post War Educational Development in India popularly known as the Sargent Plan which aimed at providing free and compulsory education within a period of forty years was drawn up in 1944 strong opposition was expressed from all sides on the ground that this was too long a period and the country could not remain without a system of free and compulsory education for forty years Thirteen years have passed since the Sargent Plan was drawn up and we are still far from attaining the goal The main difficulty in implementing the directive of the Constitution with regard to free and compulsory education is financial and a proposal is already under consideration to reduce the target from age limit of 14 to 11 and this too to be achieved by the end of third Five Year Plan

When we are faced with a difficult situation which is compelling us even to compromise with the directive of the Constitution, if expenditure increases on Basic Schools without at the same time their bringing some return through productive work either to meet some of the expenditure in running the schools or in getting a mid-day meal or a school uniform for children many States may have to cut down their programme of educational expension Though it is true that the *per capita* expenditure on primary education in our country is pitiably low as compared to other countries and we must increase it considerably if we wish to improve our educational system we cannot at the same time ignore the present resources of the country Basic Schools undoubtedly are better schools and have better equipment and more qualified staff but it may be difficult to maintain a high level of expenditure unless we also take the prodctive aspect more seriously If we allow

the children to play with and waste the craft material we not only do positive harm to the personality of the child by developing in him wrong habits and attitudes towards work but also retard the progress of elementary educat on

Some significant experiments have been made which prove beyond doubt that under appropriate conditions productivity and in come from it can become an important factor in the expansion and improvement of Elemen tary Education Some schools in Bihar have attained self sufficiency to the extent of 20 to 50 per cent The Basic School in Seva gram is reported to have attained 77 per cent of self-sufficiency in regard to recurring ex penditure These experiments are hopeful and indicate the direction in which Basic Education should move

Urban Areas

Another direction in which reform is urgently needed is to introduce Basic Educa tion in urban areas After having accepted Basic Education as the pattern of national education it cannot be allowed to remain limited to isolated units in rural areas The existing system of education in urban areas will have to undergo radical transformation At present there are hardly any Basic Schools in urban areas and the traditional system with its emphasis on academic work examinations marks and promotions continues to function with full vigour As long as the people in the urban areas continue to take advantage of the traditional system for the attainment of positions of power and influence and for rising higher in social ladder, Basic Education will be looked upon by the rural people with suspicion They have already begun to feel that this is only a device to keep them to their hereditary professions and in this way de prive them of the various material and cultural advantages which are available to people living in the cities - If Basic Education is good for the rural people it should be good for the urban people also In a democ ratic society there can be no justification for having two parallel systems of education—one for the rural and the other for the urban peo ple The Government of India has, there fore already undertaken a programme of con verting ordinary schools into Basic Schools The pace of conversion has however to be accelerated without sacrificing efficiency so that we may have one uniform pattern for the whole country

Two Directions

These are the two directions in which Basic should move in future if it is to be- a national system. The progress of Ba-sic Education in the past has been marred by the people who are opposed to any change in our educational system as also by those blind devotees who hold fast to the theory of Basic Education in a dogmatic spirit Basic Educa tion has to fight against both the prejud ces and dogmas of people The prejudice of intellectual classes who look down upon Basic Education as a primitive method has to be overcome by making them realize the dignity of manual work The philosophy underlying Basic Education which is developed not in abstraction but out of the actual context of the social situation must penetrate the clois tered atmosphere of our universities This can best be done not through propaganda but by actual demonstration that the products of basic schools turn out to be better citizens than of ordinary schools At the same time Basic Education has also to get out of narrow dogmas and theories which cannot stand proper examination at the hands of the severest of critics and opponents Basic Education is meant to serve a dynamic society and there fore must continue to adapt itself to the needs of the changing social environment and also at the same time be instrumental in bringing about the desirable changes

---

(Continued from page 200)

presented at Bandung that colonialism and issues of cold war would creep in Once the principle of openly discussing all problems was accepted India Burma Indonesia Nepal Cambodia and Laos made their stand quite clear This stand was opposition to military pacts whether Western or Soviet and con-sideration of an alternative to military pacts The real work of the Bandung conference has just begun and its results would be known only after some time when actual implementation of its resolution begins

India has arrived on the Asian stage and stands in an unprecedented collective leader ship on this historical stage She does not seek individual leadership in South East Asia, for such leadership is neither possible nor desirable for any single country in this region She has absolutely worked in the cause of peace through the United Nations and out-side of it when necessary with some success and the esteem and affection of millions of peoples outside her border is based on sound foundations Whether this success is short lived and illusory or substantial and lasting time alone can show But signs are not wanting that the part India has played in the affairs of South East Asia has been beneficial to herself and to others concerned and in this faith India looks ahead to the future. •••

A Decade of India's Economic Progress

By Sri BABUBHAI M. CHINAI
President, Federation of Indian Ceambers of Commerce and Industry

INDEPENDENT India has completed ten years A decade after all is but a short span in the life of a nation But these ten years have been unique in the history of India During this short period the country had to face formidable problems of great complexity We had to pay the unavoidable price for our Independence—Partition of the country —which presented acute problems arising out of mass movements of population on an unprecedented scale and the inter connected problems of refugee rehabilitation We have accomplished what is known as 'the bloodless revolution viz the integration of about 560 heterogeneous States into the Indian Union without any conflict The Zamindari system has been abolished in many States conferring an inestimable boon on the tiller of the soil We have also witnessed the inauguration of the scheme of reorganisation of States ushering in a redistribution of the administrative units of the country on a more compact and rational basis On the economic front in the unremitting war on hunger and poverty India has made a commendable progress In this article it is proposed to portray in brief the economic advance accomplished by our country in the short period of a decade and to lay stress on such aspects of economic policy and/or structural bottle necks which tend to retard or slacken the pace of national reconstruction

Shortage Of Capital

The achievement of political independence impelled in the minds of the people new urges new ideas and new aspirations Foreign domination extending over a century and more and on top of it the Second World War had a serious impact on the Indian economy The country had to pass through the difficult phase of post war economic problems in terms of shortages of food and other basic requirements inflationary forces and the consequent stress and strains on the economic structure of the country There was a universal shortage of capital and savings were necessary for development The per capita incomes were very low and the overwhelming majority eked out a precarious existence working on sub-marginal [illegible] fundamental social services such as education health aed sanitation were badly lacking The promotion of basic economic development had been neglected and the result was that the production of power and facilities for transport and communications fell far short of actual requirements The enlightened leadership of the Nation alive to their responsibilities and knowing the pulse of the people realised that political freedom unaccompanied by economic freedom will only be a myth and unless the common man was assured of opportunities of fuller and better existence the term 'Welfare State would lose much of its meaning and content Against heavy odds and undaunted by difficulties they therefore set about on the arduous task of raising the standard of living of the general masses of population as rapidly as possible

Our First Plan

The First Year Plan was thus a first organised attempt at attacking the poverty of India on a wide front It was launched with the twin objective of firstly correcting the disequilibrium in economy caused by the war and the partition of the country and secondly to initiate simultaneously a process of all round balanced development which would ensure a rising national income and a steady improvement in living standards Programmes of national development on such a massive scale could be executed only with the co-operation of all segments of our national economy Planning in a democratic State said the Commission 'is a social process in which in some part every citizen should have the opportunity to participate To set the pattern of future development is a task of such magnitude and significance that it should embody the best thought of the country and reflect as fully as possible the impact of public opinion and the needs of the community Private enterprise in India unreservedly accepted the principle of planned development and the national objective of increased production and equitable distribution The First Five Year Plan had naturally laid greater emphasis on development of agriculture irrigation schemes and multi- [illegible]

the children to play with and waste the craft material we not only do positive harm to the personality of the child by developing in him wrong habits and attitudes towards work but also retard the progress of elementary education

Some significant experiments have been made which prove beyond doubt that under appropriate conditions productivity and income from it can become an important factor in the expansion and improvement of Elementary Education Some schools in Bihar have attained self sufficiency to the extent of 20 to 50 per cent The Basic School in Sevagram is reported to have attained 77 per cent of self-sufficiency in regard to recurring expenditure These experiments are hopeful and indicate the direction in which Basic Education should move

Urban Areas

Another direction in which reform is urgently needed is to introduce Basic Education in urban areas After having accepted Basic Education as the pattern of national education it cannot be allowed to remain limited to isolated units in rural areas The existing system of education in urban areas will have to undergo radical transformation At present there are hardly any Basic Schools in urban areas and the traditional system with its emphasis on academic work examinations marks and promotions continues to function with full vigour As long as the people in the urban areas continue to take advantage of the traditional system for the attainment of positions of power and influence and for rising higher in social ladder, Basic Education will be looked upon by the rural people with suspicion They have already begun to feel that this is only a device to keep them to their hereditary professions and in this way deprive them of the various material and cultural advantages which are available to people living in the cities If Basic Education is good for the rural people it should be good for the urban people also In a democratic society there can be no justification for having two parallel systems of education—one for the rural and the other for the urban people The Government of India has therefore already undertaken a programme of converting ordinary schools into Basic Schools The pace of conversion has however to be accelerated without sacrificing efficiency so that we may have one uniform pattern for the whole country

Two Directions

These are the two directions in which Basic [illegible] should move in future if it is to be a national system. The progress of Basic Education in the past has been marred by the people who are opposed to any change in our educational system as also by those blind devotees who hold fast to the theory of Basic Education in a dogmatic spirit Basic Education has to fight against both the prejudices and dogmas of people The prejudice of intellectual classes who look down upon Basic Education as a primitive method has to be overcome by making them realize the dignity of manual work The philosophy underlying Basic Education which is developed not in abstraction but out of the actual context of the social situation must penetrate the cloistered atmosphere of our universities This can best be done not through propaganda but by actual demonstration that the products of basic schools turn out to be better citizens than of ordinary schools At the same time Basic Education has also to get out of narrow dogmas and theories which cannot stand proper examination at the hands of the severest of critics and opponents Basic Education is meant to serve a dynamic society and therefore must continue to adapt itself to the needs of the changing social environment and also at the same time be instrumental in bringing about the desirable changes

presented at Bandung that colonialism and issues of cold war would creep in Once the principle of openly discussing all problems was accepted India Burma Indonesia Nepal, Cambodia and Laos made their stand quite clear This stand was opposition to military pacts whether Western or Soviet and consideration of an alternative to military pacts The real work of the Bandung conference has just begun and its results would be known only after some time when actual implementation of its resolution begins

India has arrived on the Asian stage and stands in an unprecedented collective leadership on this historical stage She does not seek individual leadership in South East Asia for such leadership is neither possible nor desirable for any single country in this region She has absolutely worked in the cause of peace through the United Nations and outside of it when necessary with some success and the esteem and affection of millions of peoples outside her border is based on sound foundations Whether this success is short lived and illusory or substantial and lasting time alone can show But signs are not wanting that the part India has played in the affairs of South East Asia has been beneficial to herself and to others concerned and in this faith India looks ahead to the future •••

A Decade of India's Economic Progress

By Sri BABUBHAI M. CHINAI
President, Federation of Indian Ceambers of Commerce and Industry

INDEPENDENT India has completed ten years. A decade after all is but a short span in the life of a nation But these ten years have been unique in the history of India During this short period the country had to face formidable problems of great complexity We had to pay the unavoidable price for our Independence—Partition of the country—which presented acute problems arising out of mass movements of population on an unprecedented scale and the inter connected problems of refugee rehabilitation We have accomplished what is known as the bloodless revolution viz the integration of about 560 heterogeneous States into the Indian Union without any conflict The Zamindari system has been abolished in many States conferring an inestimable boon on the tiller of the soil We have also witnessed the inauguration of the scheme of reorganisation of States ushering in a redistribution of the administrative units of the country on a more compact and rational basis On the economic front in the unremitting war on hunger and poverty India has made a commendable progress In this article it is proposed to portray in brief the economic advance accomplished by our country in the short period of a decade and to lay stress on such aspects of economic policy and/or structural bottle necks which tend to retard or slacken the pace of national reconstruction

Shortage Of Capital

The achievement of political independence impelled in the minds of the people new urges new ideas and new aspirations Foreign domination extending over a century and more and on top of it the Second World War had a serious impact on the Indian economy The country had to pass through the difficult phase of post war economic problems in terms of shortages of food and other basic requirements inflationary forces and the consequent stress and strains on the economic structure of the country There was a universal shortage of capital and savings were necessary for development The per capita incomes were very low and the overwhelming majority eked out a precarious existence working on sub-marginal [illegible] fundamental social services such as education health aed sanitation were badly lacking The promotion of basic econom c development had been neglected and the result was that the production of power and facilities for transport and communications fell far short of actual requirements The enlightened leadership of the Nation alive to their responsibilities and knowing the pulse of the people realised that political freedom unaccompanied by economic freedom will only be a myth and unless the common man was assured of opportunities of fuller and better existence the term 'Welfare State would lose much of its meaning and content Against heavy odds and undaunted by difficulties they therefore set about on the arduous task of raising the standard of living of the general masses of population as rapidly as possible

Our First Plan

The First Year Plan was thus a first organised attempt at attacking the poverty of India on a wide front It was launched with the twin objective of firstly correcting the disequilibrium in economy caused by the war and the partition of the country and secondly to initiate simultaneously a process of all round balanced development which would ensure a rising national income and a steady improvement in living standards Programmes of national development on such a massive scale could be executed only with the co-operation of all segments of our national economy Planning in a democratic State said the Commission 'is a social process in which in some part every citizen should have the opportunity to participate To set the pattern of future development is a task of such magnitude and significance that it should embody the best thought of the country and reflect as fully as possible the impact of public opinion and the needs of the community Private enterprise in India unreservedly accepted the principle of planned development and the national objective of increased production and equitable distribution The First Five-Year Plan had naturally laid greater emphasis on development of agriculture irrigation schemes and multi- [illegible]

of economic advancement in subsequent periods

The responsibility for industrial development in the first plan period was however placed mainly on the private sector the State exercising a regulatory role While there had been shortfalls in expenditure under almost all heads in the public sectore the development efforts were geared up to a remarkable high level particularly in vital fields like the irrigation and power agricultural improvement and railways and roads and the progress achieved has been very impressive So far as the private sector was concerned, despite many drawbacks difficulties and handicaps that beset their efforts they could not only maintain the rate of investment as envisaged in the plan but could also fulfil and in many cases surpass the targets of production laid down for the organised industries The tempo of progress could perhas have been further accelerated if there had been an increasing awareness on the part of the Government of the vital role that private enterprise can play in the overall scheme of rapid industrialisation of the country All the same the performance of the private sector was by no means insignificant Industrial production recorded an increase of the order of 40 per cent over the five year period Agricultural production also showed striking improvement the index of agricultural production rising from 95 6 in 1950 51 to 114 6 in 1955 56 The output of foodgrains in 1955-56 at 64 8 million tons was about 3 million tons above the target laid down in the plan and the output of cotton jute and oilseeds also recorded substantial increases Over the five years of the plan national income increased by about 17 5 per cent, and the level of investment in the economy by the end of the plan period was about double the level in 1950 51 In short during the period of the first plan the country had been able to combine in a substantial measure economic development with financial stability The First Five-Year Plan was however only one step in our long and steady march towards our goal of national reconstruction

Our Second Plan

Encouraged by the success of the first Five Year Plan and conscious of the great leeway that we had to make in industrial advancement the country determined to launch the Second Five Year Plan—a plan more massive in siz and bold in its conception in what it sought to achieve The principal objectives of the Second Five-Year Plan are sizable increase in national income so as to raise the level of living in the country rapid industrialisation with particular emphasis on basic and heavy industries a large expansion of employment opportunities and a reduction of inequalities in income and wealth and a more even distribution of economic power While at the initial stage the total development outlay of the Central and State Governments was estimated to be of the order of Rs 4 800 crores the same was subsequently upgraded to Rs 5,300 crores Of this total outlay Industries and Mining claim about 19% Transport and Communications about 29% Irrigation and Power 19% Agricultural and Community Development 12% and Social Services about 29% The likely level of investment in the private sector during the period is estimated to be of the order of Rs. 2 400 crores The plan aims to achieve an increase in national income on an average of 5 per cent a year and an increase in employment opportunities to 9 to 10 million people Although the feeling was shared by some of us that the targets set and the expectations made of the Second Five Year Plan were in some respects on the high side and little over ambitious from the point of view of our capacity and resources we realised that when we take into account the magnitude and urgency of the country's needs the tempo of progress and the objective aimed were only modest After all we cannot afford to leave people in despondency for longer time and even if it meant a greater degree of sacrifice and toil from the present generation the adventure was worth passing through Thus the nation embarked on the second phase of our planned programme of economic development with hope and confidence generated by the success of the first plan and with determination and courage

A Set back

Great economic developments however are usually obscured by painful and even chronic ailments like inflation and cyclical fluctuations. The path of progress seldom runs smooth An under developed economy which seeks to break the vicious circle of poverty has to grapple with what Nurkse had called the circular constellation of forces which tend to keep a poor country in a state of poverty and in the process must be prepared to face initial jerks and jolts before it gathers momentum to move on an accelerated pace and on an even keel. Certain pitfalls are inevitable in the transitional stage, because of the inherent shortcomings contradictions and structural bottlenecks of a backward economy These may well

be termed as a 'crisis' of development but all the same they appear so suddenly and on so many fronts that they have engendered in a section of the community a sense of frustration, despair and uncertainty about the future The atmosphere of hope and confidence that prevailed at the end of the First Plan has within a year transformed the entire picture that we are today confronted with the need for a reflection and re appraisal on the economic front Our anxiety to accelerate the tempo of developmental activities has on the one hand given a spurt to inflationary tendencies in our economy and on the other led to a serious strain on our foreign exchange resources The situation became more complex and complicated by the cumulative effect firstly of the Suez Canal crisis which meant a virtual blockade of our import export trade over a period and also led to an enormous rise in the cost of our imports secondly of the deteriorating food situation which necessitated once again by import of foodgrains in bulk from abroad and thirdly by unprecedented heavy withdrawals of our accumulated Sterling balances for meeting the cost of imports of plant and machinery and essential raw materials required for sustaining an accelerated rate of investment under the Second Plan The steady and rapid deterioration of our foreign exchange resources and the persisting inflationary tendencies within the economy completely upset the Plan calculations and emphasised the compelling need for a reassessment of the available internal and external resources and a rational readjustment of our development programme in terms of evolving a scheme of priorities so as to save what has been described as the core of the Plan

Foreign Exchange

The efforts of Government in recent times to augment agricultural production drastic cuts in non-essential imports with a view to making the best use of our foreign exchange resources the imposition of strict austerity in non-developmental administrative expenditure the steps taken to attract foreign capital and investment to supplement our internal resources are all indicative of the determination of Government to overcome these transitional crises The importance of external assistance for the implementation of our Plan requirement of which has now been estimated to be in the order of Rs 1 600 crores scarcely needs to be reiterated Taking into account the external assistance that has already been promised and the Sterling Balances and the I M F credit already utilised there is a gap of Rs 700 crores to be bridged The recent tour of our Finance Minister and the visit of the Industrial Delegation sponsored by the Federation of Indian Chambers of Commerce and Industry under the leadership of Sri G D Birla to some of important countries like the U S A Canada the U K and West Germany have contributed greatly to generate in those countries a spirit of understanding and appreciation of our valiant efforts at national re construction They have been successful in removing some of the misapprehensions and misunderstandings regarding our basic policies and principles and our approach to the problem of economic development in general and the role of the private sector in particular While no precise estimate could be made at this stage of the extent of external assistance that would be forthcoming in the coming years it could be safely asserted that given the proper incentive a reasonably significant contribution could be expected from these countries Indeed the chances of obtaining commercial credit and ensuring foreign collaboration in our investment programme are bright if our economic policies are suitably re-orientated on pragmatic rather than on doctrinnaire considerations

Over simplified solution to economic ills or sweeping measures to check stray individual malpractices here and there more often than not work as boomerangs tending to complicate the smooth working of economic forces The compulsory deposit scheme undue interference by Government in Company promotion and management encroachment of the State Trading Corporation into spheres traditionally handled by the private sector levy of Excise Duty on cotton textiles are some of the instances in point

The fear of nationalisation without substantial compensation consequent upon the amendment of the Consitution high taxations fear of labour troubles tax on Royalties absence of Income-tax exemptions for foreign technicians have all been cited as serious deterrents desisting foreign investment Even for attracting the requisite venture capital in India an atmosphere of confidence and hope needs to be created

(Courtesy *The Hindustan Standard*)

ZONAL COUNCILS PROMOTE UNITY

AROUND a table, almost every quarter, sit Chief Ministers of States and heads of Union Territories in small groups—of two three or four --to discuss problems which baffle them individually but find some solu tion by their collective efforts and resourc s

For instance a State wants electricity but does not have enough natural resources to generate it Another requires technicians but lacks training facilities Yet another could develop a tourist centre if the nearby State could give a helping hand

All such problems are pooled and await their turn when the States meet together Zone wise There is a free discussion and decisions are taken keeping in view the limita tions, resources and demands of a particular State Helping in the discussions is the Central Government whose Home Minister presides over the meetings and whose repre sentatives from such bodies as the Planning Commission and the Home Ministry tender their advice

Already since November 1 1956 when the concept of inter-State co-operation took a concrete shape much ground has been cover ed Jammu and Kashmir Punjab Rajasthan Delhi and Himachal Pradesh which form the Northern Zone have set up a technical committee to plan a co-ordinated de velopment of power resources on a regional basis The Southern Zone s States Andhra Pradesh Kerala and Madras along with Mysore have asked their Inspectors-General of Police to examine the question of having a common reserve police

Similarly the Eastern Zone, with Assam Bihar West Bengal Orissa Manipur and Tripura as its members has discussed mea sures for a better and speedier rehabilitation of displaced persons from East Pakistan The States of Uttar Pradesh and Madhya Pradesh forming the Central Zone have considered the question of the dacoit menace on their borders The Western Zone com prising the States of Bombay and Mysore has plans to divert water from the Western water-shed of the Ghats to the east

Production

But the main task before the States group-ed in five Zones is how to make concerted efforts for an integrated development of the region and the country Take the example of Plan targets They have been recast with the help of the Planning Commission in order to conform better to the pattern of reorganised States

The food targets have been enhanced and now the northern Zone s commitment is 25 5 lakh tons instead of 16 7 lakh tons the Central Zone s 41 02 lakh tons instead of 28 9 lakh tons and the Southern Zone s 32 57 lakh tons instead of 18 26 lakh tons

Man Power Bodies

Side by side all the five Zones have set up man power committees to assess the needs of technical p rsonnel of the region for future requirements and to arrange for their training A state which has no technical schools will be able to send its trainees to the neighbour ing State Jammu and Kashmir and Himachal Pradesh for example have arranged to send th ir farm trainees to the Agricultural school in Punjab Punjab in turn, is sending Gram Sevaks from their hill areas to Himachal Pradesh for a basic agricultural course

The Zones have also accepted in princi ple the recommendation of the States Re organisation Commission that one third of the High Court Judges in a State may be appointed from outside Already a Judge of West Bengal has gone to head the Mysore Bench and a Judge from the Allahabad High Court has been transferred to the Rajasthan High Court

Origin

This process of inter-State reliance and co-operative working started on the suggestion of the Prime Minister in the Lok Sabha in 1955 that the country may be grouped into four or five Zones each with an Advisory Council The States Reorganisation Act which came into force on November 1 1956 gave it a legal form and outlined five Zones keeping in view the natural divisions of the country, cultural and linguistic affinities rivers and means of communication and requirements of economic development security law and order

A secretariat whose expenses are borne by Centre is also attached to each Council to do the follow-up work in the light of decisions taken at various meetings But in no way is the legislative and executive authority either

THE EARTH, THE SUN AND THE TIDES

By MAZUREVSKY

FOR thousands of years this problem excited the interest of scientists in different countries. Various theories were created concerning the origin of the Earth however all of them have been rejected In 1943 the Soviet scientist Academician O J Schmidt put forward his cosmogonic theory in which the problem of the origin of the Earth and planets is treated in an entirely new way

Lately a tremendous number of dark nebulae have been found in the Galaxy They are gigantic accumulations of opaque dust matter

According to O Schmidt stars which move at different speeds in the depths of the Galaxy may meet such nebulae on their path In his opinion the sun at one time passed through such an accumulation of dark matter and by the force of its attraction captured a part of the dark nebulae consisting of small and large solid particles

Thus a swarm of particles moving around the Sun was formed As a result of the sticking together' of separate particles planets eventually evolved from this swarm

The particles located nearer to the Sun would fall upon the latter so that in its inner parts the swarm became poorer in meteorite material Naturally the planets lying closer to the sun consequently contain less substance than the planets moving farther away from it these bodies were evidently formed from the parts of the swarm that contained more meteorite material

The process of planet development evidently continued for many millions of years According to Schmidt's calculations it must have taken some seven billion years for the Earth to grow to its present dimensions This figure agrees well on the whole with the data obtained by modern geophysics It has been established on the basis of the latest methods of radioactive investigations that the Earth s crust is about 2 3 milliard years old However the Earth is older than its crust.

Schmidt s theory convincingly explains certain specific features of the solar system On the basis of mathematical calculations the scientist asserted that under the action of the meteorites falling on the planets the latter inevitably must have begun to revolve precisely in the direction in which they now moved around the Sun

Some planets have so-called ' reverse ' satellites that is bodies which move around their planets not from west to east as usual but from east to west Schmidt attributes this to the fact that the dust cloud out of which the planets were formed may have contained particles with forward and reverse movement

What do we know about the early period of the Earth s life ? About 2 000 000 000 years ago the solid crust of our planet was formed The oldest rocks on our planet known to science are more than 1 500 000 000 years old The process of formation of the Earth s crust evidently took scores of millions of years It was accompanied by orogenesis and later by the origination of oceans and seas

The Structure Of The Earth

The problem of the internal structure of the Earth remained unsolved for a long time It is of tremendous significance for elucidating the laws of the distribution of minerals for the solution of the problem of the movement of the Earth s crust for an understanding of volcanism earthquakes etc

Why is the earth so solid ? Is it only covered by a very hard thick crust or perhaps its body is solid to the core? So far the state of the Earth s substance can be judged only by what we observe on the surface

People have drilled holes to depths of 5-6 kilometres It was found that at such a depth the temperature of the rocks was above 100° C. The rise in temperature observed in penetrating into the bowels of the Earth makes it impossible to sink mines deeper than 2.5-3 km.

In the upper layers of the crust the temperature usually rises by 1° C with every 30-50 metres though there are exceptions to it. It is not known as yet how rapidly the temperature rises at a depth of more than 6 kilometres However the eruptions of volcanoes show that at a depth of 2 3 score kilometres the temperature is very high The temperature of volcanic lava is about 1000° C.

Though all this may show that the interior of the Earth consists of a melted mass, accord

ing to the latest scientific data the Earth is considered a solid body

By solid we mean a body the particles of which resist displacement in respect to each other, which is not followed by the changes in the volume of the body Such for instance are metals In altering the shape of a metal cube we come against the great resistance of its particles.

It is now believed that the temperature inside the Earth does not exceed 2000 2500° C However rocks heated to such a temperature on the Earth s surface melt But inside the Earth they are subjected to tremendous pressure which prevents the expansion of volume —the result of the melting of almost all bodies That is why despite the high temperature rocks in the depths of the Earth remain solid Only in cases when the Earth s crust breaks forming deep cracks at the bottom of which pressure markedly drops the hot solid rocks melt The lava thus formed rises along the cracks and spreads on the surface

The problem of the internal structure of the Earth can be solved by studying the resilient vibrations caused by earth quakes and recorded at the seismic stations This is called the seismic method

It shows that the thickness of the Earth s crust in the districts of the mountain system is greater than under plains For instance under the plains of the European and Asian parts of the USSR the thickness of the Earth s crust was found to be 30 35 kilometres under the Caucasus Mountain Range—50 60 kilometres and under some districts of Central Asia—70 kilometres

The seismic method led scientists to suppose that the Earth had a nucleus at a depth of 2900 kilometres Its substance possesses other resilient properties and other rates of propagation of seismic waves than those of the Earth's shell Seismic investigations have fully confirmed this supposition Within recent years the data obtained with the help of the seismic method made it possible to study the structure of the terrestrial nucleus itself It was found that this nucleus contained another internal nucleus. The radius of the first nucleus is approximately 3500 kilometres while that of the internal nucleus is of the order of 1300 kilometres

These data lead to the conclusion that the globe consists of four parts the crust the shell the nucleus and the internal nucleus

The Composition of the Earth

During recent years information has been obtained about the chemical composition of many stars and nebulae *It has been found* that stars nebulae and interstellar substance possess a similar chemical composition that is the relative number of atoms of different chemical elements in *them* is about the same This is one of the manifestations of the material unity of the Universe

The most widespread chemical element in the Universe is hydrogen (90 per cent of the total number of atoms) the second place is occupied by helium an inert element which does not enter into chemical compounds the third fourth and fifth places are occupied by oxygen nitrogen and carbon (together they constitute 0 3 per cent) Silicium and metals are incomparably less widespread Wherever physical conditions permit the combining of atoms into molecules hydrogen molecules and compounds of hydrogen with other atoms present in large quantities (oxygen nitrogen and carbon) are formed As a result molecules of water ammonia and methane as well as carbon dioxide appear Thus a large number of volatile substances originate which pass into the solid state only under very low temperatures Because of the small number of silicium atoms and metals very few molecules of rocky substances are formed

Rocky substances consist chiefly of silicium iron magnesium and aluminium oxides

In nature there are many ores which are much heavier than granite basalt and other rocks of which the Earth s crust consists Such are for instance iron ores If the entrails of the Earth are rich in Iron then its great weight can be easily explained. A study of the composition of the rocks in the Earth s crust led scientist to the conclusion that the deeper the rocks occur the more iron they contain.

The upper parts of land consist of stratified rocks Under them lies the granite shell —the foundation of the continents It is 10-15 kilometres thick. Beyond lie the basalt shell consisting of dark basalt rocks which are much richer in iron than granite or the stratified rocks What is known as ultra basic rocks which are even richer in iron, outcrop at certain places rising from great depths Scientists therefore suppose that under the basalt shell up to about 1300 kilometres the Earth consists of ultrabasic olivine rock (olivine is a dark green mineral

containing a large amount of iron and magnesium)

The parts of the Earth which lie deeper than 1200 kilometres must consist of still heavier rocks only under this condition can the average specific gravity of the Earth be equal to 5 52 Although rocks heavier than the olivines have not been found among the terrestrial rocks nevertheless they do exist in nature

* * *

The Sun

Because the Sun is far away from the Earth it seems a small body to us Actually it is a huge cosmic body by 1 300 000 times larger in volume than our planet The diametre of the Sun is 1 400 000 kilometres i e by 109 times larger than the diameter of the Earth

According to modern scientific data the Sun is a hot gaseous body The temperature on its surface is about 6000°C while in its depths the temperature reaches 20 000 000°C Despite its gaseous state the substance of the Sun's central part is subjected to extremely great pressure and is therefore very dense It is by many times denser than any known body on Earth

Density of Sun s Centre

This great density of the substance in the depths of the Sun is explained by the fact that under the conditions of high temperature existing on the sun atoms lose their electron shells

Already on the surface where the temperature is 6000°C some atoms lose their outer electrons As to the central parts of the Sun where the pressure is extremely great and the temperature reaches 20 000 000°C atoms almost completely lose their electrons become mere fragments of atoms Under these conditions electrons and atomic nuclei exist independent of each other Since there are no electron shells around the nuclei the distances between the latter may become comparatively small Therefore all the substances in the depths of the Sun can be greatly compressed This is the cause of the density in the central part of the Sun

Under such a high temperature complex substances cannot exis on the Sun They disintegrate For instance it is known that under high temperature water vapour disintegrates into hydrogen and oxygen And so the substance of the Sun is on the whole a mechanic mixture of different elements.

For milliards of years the Sun has been continuously emitting a tremendous amount of heat and light into world space In losing radiant energy the Sun inevitably loses mass It has been calculated that it loses more than four million tons a second

Origin of Solar Energy

Today it is believed that solar energy originates in the central part of the Sun passes through its entire thickness and is emitted from the surface into world space How is this energy formed ?

Under temperatures of several thousand degrees compounds disintegrate into the elements of which they consist while under temperatures of several score million degrees the transformation of elements or nuclear reactions have been studied experimentally today On the basis of these data physicists have elaborated a theory of cyclic nuclear reactions and elucidated the condition for the transformation of the lightest element hydrogen into the heavier element helium This reaction is accompanied by the emission of a tremendous amount of energy It has been calculated for instance that during the transformation of one gram of hydrogen into helium the amount of energy emitted is equal to that produced by the burning of 15 tons of gasoline.

A Huge Laboratory

In the central part of the Sun the temperature reaches 20 million degrees C Calculations show that under such temperatures hydrogen is transformed into helium and a tremendous amount of energy is emitted The sun is therefore a sort of huge laboratory in which the continuous transformation of elements takes place

Carbon serves as the 'catalyst i e the substance that accelerates the nuclear reaction The sun at present is so to say passing through the carbon cycle of nuclear reactions the final result of which is the formation of helium from hydrogen the carbon in this reaction is not spent it merely conditions the cycle

It remains only to throw light on the question as to how long the fuel material will last on the Sun if its temperature is kept up at its present level For this it is necessary that 500 million tons of hydrogen be transformed every second into helium in the Sun Can the Sun stand such a strain ? Will it stop shining after its stock of fuel is exhausted?

These fears are groundless The Sun is so large, its stocks of hydrogen so great (50

per cent of the Sun's entire mass) and the losses of this mass due to radiation are so insignificant that we may rest assured that the Sun will continue to supply light and heat to our Earth for many milliards of years to come just as intensely as it does today

*　　*　　*

The Tides

The tides are periodic (1) fluctuations in the level of the sea (2) deformations of the solid part of the Earth and (3) fluctuations in atmospheric pressure, caused by the attraction of the Moon and the Sun

The Tide forming Forces

Already in ancient times it was noticed that there existed a connection between the periodic fluctuations of the sea level and the phases of the Moon It was also noticed that the tides were highest during the syzygies (new moons and full moons when the Moon the Earth and the Sun lie approximately along one straight line), and are lowest during the days of the quadratures (the first and the last quarters of the Moon when the lines from the Earth to the Moon and the Sun form a right angle) Tides depend upon a definite position of the Earth the Moon and the Sun and are connected by mutual attraction The difference between the force of attraction of the Sun or the Moon and the terrestrial body causes the tides

Tides in the Hydrosphere of the Earth

Tides in the hydrosphere are the periodic changes in the level of the sea in relation to its average position They occur as a result of the influence of the force of attraction of the Moon and the Sun The magnitude and nature of the tides depends not only upon the mutual position of the Moon Earth and the Sun but also upon latitude and local conditions the irregularities of the coastline the depth of the line of the tidal wave etc Far away from the coast in the ocean the maximum height of the tide is no more than one metre while near the coast depending upon its outlines and the depth of the sea tides may reach a great height High tides are observed near the coasts of ocean gulfs in the seas that fall into the ocean and th bays into which the ocean tidal wave freely flows For instance in Fandy Bay (the Atlantic coast of Canada) the tide at its highest is 18 metres.

Tides in the Solid Body of the Earth

Tides arise not only in the water cover of the Earth but also in the whole of its mass from centre to surface Under the action of tidal forces the Earth is deformed as a resilient body The movement of the masses of the Earth and the changes in their density due to the small compressions and expansions caused by deformation create additional attaction to the direct action of the moon and the Sun and exert an influence on the magnitude and direction of the force of gravity No tides would arise in the solid part of the Earth if our planet were absolutely solid (non-deforming) and they would be at their highest if the Earth were liquid That is why a study of the magnitude of these tides supplies valuable information concerning the internal structure of our planet and first of all, concerning its resilience

Atmospheric tides manifest themselves in the periodic fluctuations of atmospheric pressure as well as in the periodic changes of certain properties of the upper layers of the atmosphere

—o—

INLAND WATER TRANSPORT IN INDIA

India is fortunate in having a vast system of rivers large and small perennial and seasonal

Of the very large number of rivers in India, only 3 000 miles, at present represent navigable rivers

Besides these navigable reaches of the rivers about 2 670 miles represent navigable canals and backwaters

Water transport is the cheapest mode of transport Both capital cost and maintenance cost of the waterways are much less than the corresponding costs of railways or roads Water transport is more suited to the long haul movement of bulk commodities food grains and other farm produce in large volumes

The other important item which could be moved with advantage by water is coal, the cost price of which also has a bearing on national economy

With the rapid industrialisation of the country and consequent heavy pressure on the existing rail and road transport systems which are already congested it has become increasingly necessary to explore the possibilities of improving and extending inland waterways as an alternative means of transport

The Ministry of Transport have appointed an Inland Water Transport Committee to examine the possibilities of improving and extending inland navigation in the country based primarily on the proposals prepared by the Central Water and Power Commission

RECORDS—A D. 1957

By NORRIS MCWHIRTER

THE year 1957 has surpassed all others in the history of record breaking Yet there is every reason to feel certain that even its dangerously exciting tally will be eclipsed in 1958

Though this century has another 43 years to run it has already seen three new epochs. At 10 30 a m on December 17 1903 near Kill Devil Sand Hill North Carolina the age of flight began the morning of July 16 1945 near Alamagordo New Mexico was the dawn of the atomic era on October 4 1957 from a still undisclosed site within Russia man s agent first invaded outer space

Human records were well represented during the last 12 months Robert Earle Hughes reinforced his claim to be the world s greatest man in his own private sense the latest reported girth of this 31 year old ' farm boy from Illinois is 115 inches around the waist with a weight of 74 stone 5 lb

Russia s repeated claims for long lived citizens reached record absurdity when on December 1 Radio Moscow lamented the death of a 190-year-old woman born in 1767—during the reign of Catherine the Great No other gerontologists give credence to reports of humans living much beyond the age attained by the last American Civil War survivor Col Walter W Williams of Texas who celebrated his 115th birthday on November 14

The Oldest Cat

At Drewsteignton in Devonshire on November 30 the world s oldest known cat the tabby Ma wa put to sleep aged 35

Turning from fauna to flora it became conclusively established in March that the 'world s tallest tree was no longer the tallest This famous Californian redwood (*Sequoia sempervirens*) near Dyerville named the Founder s Tree in 1930 measured at 364 feet (only a foot less than St Paul s Cathedral) in 1947 was found to be only 346 feet tall having lost its crown probably due to a lightning strike some years ago. Happily a new and better champion was discovered four miles off High way 101 in Upper Bull Creek standing a magnificent 368 feet

The year 1956 had seen man travelling faster (2,200 m. p h) and higher (23 86 miles) than ever before On August 22 this year Russia s first *mezhkontintentalaya ballistcheskaya raketa* slightly improved upon the unmanned missile records for range velocity and perhaps altitude

These had been set on September 20 1956 by the U S Army s triple stage Jupiter C Rocket at 3 300 miles 15 000 m p h and 635 miles On October 4 the 184.3 lb Suptnik I was put into orbit at over 17 500 m p h On October 16 over Holoman Air Force Base New Mexico the Americans first achieved a projection beyond our terrestial gravitational escape velocity of 25 100 m p h

Aluminium pellets were fired by 'shaped charges from an Aerobee Rocket from a hieght of 55 miles attaining an estimated initial velocity of around 40 000 m p h On October 22 a U S Farside four stage rocket launched from a balloon at 19 miles reached an estimated altitude of at least 2 750 miles and possibly 4 000 miles

Highest Animal

All dispute as to which animal is the highest form of life was settled on November 3 when an Alaskan husky (Laika) reached 1 056 miles in the 1 120 6 lb Suptnik II Man s highest reported ascent during the year was a more tentative 19 32 miles by the American Major D G Simons This was in a 32 hour balloon ascent over Minnesota and North Bakota on August 19 20 when he reached 102 000 feet

Going to the other extreme man plumbed a new depth in the Champion Reef of the Kolar goldfield in Mysore State India where despite rock temperatures of 150 degrees F, a working depth of 10 030 feet (1 90 miles) was attained

On August 31 the Russian surveying ship *Vityaz* claimed a new ocean d pth record of 35 958 ft (6 81 miles) in the Mariana Trench in the Pacific which was 53 fathoms deeper than H M S *Challenger* s nearby record sounding of June 14 1951 A fresh water record sounding which was necessarily an exclusively Russian preserve was one of 6 364 feet in the Olkhon Crevice of the 400-mile long Central Siberia lake Baikal which had long held the title of the world s deepest lake at 5 650 feet.

Lowest Temperature

Siberia lost one record during the year when on May 11 the U.S.I.G.Y. station on the 9,200 foot high plateau at the South Pole recorded a temperature of minus 100.4 degrees F—over 10 degrees lower than Verkhoyansk's famous record of February 1892. Another 1957 meteorological record of great interest was the sighting by Major Simons of clouds at nearly 68,000 feet, which was 12,000 feet higher than the height previously regarded as the cloud ceiling.

The longest standing record of all to be beaten during the year had been set over 179 years ago. In October a sun-spot count surpassed the previous activity peak of May 1778.

During 1957 a census of Tokyo totalled 8,471,637, which indicated that Greater London (8,346,137) must at last surrender her long standing claim to be the world's most populous metropolis.

The Russians have had an *anno mirabile* apart from their satellites. The 16,000-ton atomic powered *Lenin* has ousted U.S.S. *Glacier* as the world's most powerful ice breaker and the 2,320 mile Trans-Siberian pipeline has out-done Canada's *1,775-mile long* Inter Provincial installation. Britain's mammoth radio telescope at Jodrell Bank has been outranged by a new Soviet installation while in April Russia's 36,000 ton synchrophasotron at Dubna near Moscow humbled all previous atom-smashers.

Air Speed

Great Britain's grip on the triple crown of the official speed records for land, air and water was tightened when on Coniston Water on November 7 Donald Campbell raised his own world water speed record from 225.63 m.p.h. to 239.07 m.p.h. On December 12, however, Peter Twiss's 21 month-old air speed record of 1,132 m.p.h. was bettered by Maj. Adrian E. Drew in an F101 Voodoo with 1,207.6 m.p.h. over the Mojave Desert, California. Four days later the Russians claimed a speed in excess of 1,242 m.p.h. for one of their fighters, but gave no details.

The U.S. set some characteristic records with a world TV prize record of $164,000 on February 11 by the 11 year-old schoolboy Leonard Ross of Tujunga, California, and an all time auction record of $385,000 for the Rovensky diamond necklace. One American record remaining inviolate despite Miss Christie's Mousetrap is that of "The Drunkard" which has been running in Los Angeles since July 6, 1933 and is now nearing its 8,700th performance. The Cecil B. De Milne extravaganza *The Ten Commandments* cost $1,350,000 per commandment and will also very soon outgross 'Gone With the Wind' ($33,500,000).

In the sporting world there have been some startling advances in the more highly contested spheres. Yorkshire's G. D. Ibbotson ran seven tenths of a second faster than the 37 month-old world mile record with a time of 3 min. 57.2 sec. in a year in which the tally of miles under four minutes rose to 30.

High Jumpers

The ranks of high jumpers clearing seven feet became less rarified with the increasing use of the built up shoe. Three Russians bettered the height with Y. N. Steypanov clearing a world's best height of 7 ft. 1 1/8th ins. in Leningrad on July 16 and V. A. Sitkin clearing 13 3/4 ins. above his own height in Odessa. Other records varied from the unpaced cycling of 29.15 miles in an hour by the Frenchman Roger Riviere, in Milan on September 18, to the water-skiing records of the Americans Joe Cash (126-foot jump) and John Masser (715 miles). Russia's greatest delayed drop parachutist Nicolai Nikitine fell for over nine miles (over 4 1/2 min. at 120 m.p.h.) over Saratov on August 20 when he baled out at 50,469 feet and his 'chute opened at 2,502 feet.

In football a transfer fee reached six figures on May 27 when the South Americans inside right Enrique Siveri's services were bought by Italy's Juventus Club for £100,000 sterling. A football pool win by a Lancashire widow, Mrs. Nellie McGrail, of £206,700 was announced on November 5.

In acclaiming 1957 as Russia's record breaking year it may be pointed out that her Sputnik launching was from one point of view the most expensive single deed yet performed by mankind. If estimates are correct the U.S.S.R. spent the life earnings of at least 20 million of her poorest subjects in the race to be first.

CONSTITUTIONAL PROGRESS IN NIGERIA

With the appointment of the new Prime Minister—Alhaji Abuboker Tafawa Balewa leader of the Nothern People s Congress in the Federal House of Representatives—Nigeria for the first time has a local leader to head a government responsible to and for the whole country

THE early history of what is now Nigeria is largely a matter of speculation The first Europeans to visit the coast of Nigeria were the Portuguese in the fifteenth century The first English ships under the command of Captain Windham reached the Bight of Benin in 1553 For a long period only the coast was known but following Mungo Park s voyage to the Niger in 1796 the exploration of the inter of with a view to commercial development was undertaken

In 1879 the United Africa Company was formed and three years later was incorporated as the National African Company Limited In 1885 it was granted a Royal Charter as the Royal Niger Company and performed a valu able service both in trade and in local ad ministration far into the interior up the Niger and Benue Rivers until in 1899 its charater was revoked and its territories in the North consolidated and extended became the Protectorate of Northern Nigeria

Meanwhile further to the West Lagos was occupied and made a British Colony in 1861 and later Yorubaland was attached to the Colony of Lagos as a British Protectorate

In the Niger Delta and further to the East, the Oil Rivers Protectorate later extend ed inland and renamed the Niger Coast Protectorate was established under Foreign Office control in 1885 This territory passed to Colonial Office control in 1899 and in 1906 it was amalgamated with that administered from Lagos to form the Colony and Protectorate of Southern Nigeria

Thus the British connection with what is now Nigeria was established by separate operations in different parts of the territory In 1914 the separate parts were amalgamated as the Colony and Protectorate of Nigeria Since 1922 a portion of the former German Cameroons has been administered as an integral part of Nigeria

Origins of Representative Government

The origins of representative government in Nigeria are to be found in the old Colony of Lagos where closely following its occupation by the British in 1861 a small nominated Legislative Council was established to advise and ass st the Governor and it remained in existence until 1922

The year 1922 brought far reaching changes for a Legislative Council for the Colony and the Southern part of the Protectorate was set up which though it had an official and non African majority included the first elected Africans in the legislatures of British tropical Africa This new Legislative Council which remained almost unchanged until 1946 had a maximum membership of 46 of whom 27, including the Governor were officials and 19 were non-officials

The Executive Council in the period 1922 1946 consisted mainly of officials but in 1943 5 non official members 2 European and 3 African were appointed to it

The Constitution Of 1946

The year 1946 saw the introduction of a completely new constitution in Nigeria as in the Gold Coast This constitution provided for the setting up of three advisory Regional Houses of Assembly each with an unofficial African majority and for the creation of a central legislature covering for the first time, the whole territory and having an unofficial majority drawn mainly from among the mem bers of the Regional Houses

The two considerations fuller African participation in government and greater Regional devolution have influenced each subsequent revision of the constitution and at each stage it is Nigerian opinion expressed through its own leaders which has decided the pace and timing of advance

A Big Step

In 1951 a constitution, based on recom mendations made by a predominantly Nigerian conference provided for an enlarged central House of Representatives with a majority of elected members and for the transformation of the advisory Regional bodies into elected Regional legislatures with defined legislative and financial power The Central Executive Council was transformed into a Council of Ministers with a majority of Ministers drawn from the Regions Regional Executive Councils

were established as instruments of policy with a majority of Nigerians selected from the legislatures

The present Federal constitution was introduced in 1954 following discussions in London and Lagos between representatives of the United Kingdom Government and delegations from each of the Regions and the Southern Cameroons The main effect of the 1954 constitution was to give the Regions greater autonomy by providing that certain defined subjects should be allocated to the Federal Government, either exclusively or concurrently with the Regional Governments and that all other matters should be in the hands of the Regions. Both Federal and Regional legislatures have a large majority of elected African members (in the Eastern Region the House of Assembly is wholly elected by adult franchise) and all the executive bodies have a majority of elected African Ministers

Present Constitution

The London conference (May 23 to June 26 1957) on the constitutional future of Nigeria brought the country much closer to full self government

The principal amendments to the constitution of the Federal Governments of Nigeria resulting from the decisions of the conference came into effect on Augu t 30 when the Governor General dissolved the then existing Council of Ministers and invited a Nigerian political leader a man able to command a majority in the House of Representatives, to form a government

With the appointment of the new Prime Minister—Alhaji Abubaker Tafawa Balewa leader of the Northern People s Congress in the Federal House of Representatives—Nigeria ultimately to become a full member of the Commonwealth for the first time had a local leader to head a government responsible to and for the whole country On September 2 members of the new Council were sworn in at the new session of the House of Representatives formally opened by the Governor General

It was also agreed at the conference that the Eastern and Western Regions are to have immediate Regional Self Government Pending the introduction of self-government in the Northern Region in 1959 it was agreed that increase should be made in the number of members in the House of Assembly 131 to 170

To safeguard the minorities the conference decided that a commission of inquiry should be appointed ' to ascertain the facts about the fears of the minorities in any parts of Nigeria, and to propose means of allaying these fears, whether well—or ill found But the conference emphasized the undesirability of creating new states for minorities except as a last resort

The present Federal House of Representatives is to run its full course—to the end of 1959— and thereafter it will consist of 320 representative members elected on the basis of one member for approximately each 100 000 of the population Along with these changes a second Legislative House also will be established, with the title of Senate

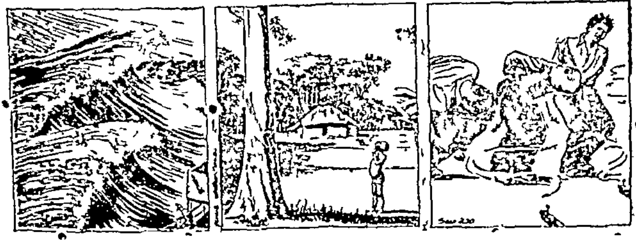
In January 1960 the newly elected legislature will debate a resolution asking Her Majest s Government to agree to full self government within the Commonwealth by a date in 1960 and Britain has given the assurance that she would do her utmost to meet the resolution in a reasonable and practical manner

The Federation of Nigeria, with an area of 373 350 square miles and a population of over 33 million is by far the largest of the United Kingdom dependencies It is a country of great diversity in climate resources languages culture and social institutions

More than half of the population live in the Northern Region which is largely Moslem and traditionally feudal and conservative in outlook Cut off until comparatively recently from contact with the south and with the outside world it still preserves much of its ancient way of life and has been slow to accept western standards of education and social services or to adopt western economic techniques Since the Second World War however progress has been rap d

Road and air communications are opening up the remoter areas and providing access to markets for the Region s groundnuts cotton livestock products tin rice and other commodities Improvements in agricultural methods have increased output and raised the quality of crops Industr es, such as textiles food-canning dairy produce oil milling have been established Education and teacher training are being pushed ahead as rapidly as possible (in 1956 there were 177 000 children attending primary schools compared with about 11 000 in 1937) and modern drugs and methods of treatment are bringing disease unde

Free Primary Education



The Western and Eastern Regions which with Lagos and the Southern Cameroons, form the southern part of the Federation have a long history of contact with Europe through traders missionaries and administrators Educational and social institutions pioneered by the missions, are firmly established and are expanding steadily The first stages of a system of free universal primary education was introduced in the Western Region in 1955 and in the Eastern Region in 1957 Port and other communications are being developed to handle the constantly increasing trade of the whole Federation (external trade was valued at £287 million in 1956 compared with £18 million in 1938) The area s natural resources —primarily cocoa, palm products timber and coal—find a ready market both in and outside Nigeria and industries have been established producing for example plywood and veneers pottery, sheet rubber, cigarettes and cement

Help From Britain

In all the Regions economic and social development has received help from the United Kingdom in the form of financial aid (Nigeria has been allocated a total sum of over £36 million from Colonial Development and Welfare funds for such projects as road construction, agriculture, education and health service) in technical assistance with engineering and other works in the prosecution of research and in education and training, both in the United Kindom and Nigeria, and in the supply of public servants teachers and men and women qualified in professional and technical skills of many kinds

Although the policy of 'Nigerianisation' is being energetically pursued responsible opinion in the territory recognises that it will be many years before Nigeria can staff the public services and the professions from its own people

DID YOU KNOW ?

Sixty feet is usually cited by experts as the greatest possible height a wave at sea can attain However in the Pacific Ocean on February 7, 1933 during a 68-knot gale, the U.S.S Ramapo recorded a wave 112 feet from trough to crest

The fastest growing tree in the world is the Eucalyptus Saligna which in Uganda Central Africa has been known to grow 45 feet in 2 years Bamboo which is not botanically classified as a tree has been observed to grow as much as 16 inches in a day to a maximum height of 120 feet

The Communists are pressing a new campaign of terror in Hungary with a Roman Catholic priest the latest to be executed for an alleged part in the freedom uprising His name was Laszlo Mindszenti (not related to the Primate of Hungary Iosef Cardinal Mindszenty) He was executed along with two freedom fighters, Zsigmond Sipos and Josef Erdesz.

The Challenge of Disappearing Cultures

By Prof ROBERT HEINE-GELDERN

FROM the birth of their science about a century ago, anthropologists must have been aware that in many respects they had come too late that important data, almost within their grasp had vanished no more than a generation before One well known example is the case of the Tasmanians (the last representatives of Paleolithic culture) H Ling Roth who collected what meagre scraps of knowledge we possess about them observed that the sad and untimely destruction of this interesting race is one of the greatest losses anthropology has suffered.

That was in 1899 and the situation has deteriorated considerably since then All over the world ancient cultures are disintegrating at an unprecedented speed Even such remote regions as the interior of New Guinea and the tropical forests of South America are rapidly being opened up and penetrated by modern culture Within a very short time many of these tribes will be absorbed by the larger neighbouring peoples and will cease to exist as separate entities The last remnants of primitive races which have never been investigated by anthropologists will disappear through hybridization Cultures and languages which have never been properly recorded will vanish Twenty years hence anthropologists will be reduced to extracting from the memories of old people scanty and unreliable fragments of information about traditions and customs which are alive to-day

In anthropology as in historical research, it is almost impossible to foresee how important an investigation is likely to be The discovery of new but apparently insignificant facts may prove to be without any real importance, or they may on the other hand lead research on to a new and unsuspected track Here is an example

In the 1930s the anthropologists Hugo and Emmy Bernatzik succeeded in getting in touch with a group of nine persons of the half legendary Yumbri or Phi Tong Luang tribe in the jungles of Northern Siam and it came as a surprise to learn that this extremely primitive people of food-gatherers ... [illegible] belonged to an early offshoot of the Mongoloid race Before this we had always thought that the Mongoloids had entered South Eastern Asia from the north as Neolithic agriculturists.

Of course it was difficult and risky to draw far reaching conclusions from this single case But ten years later came Furer Haimendorf's discovery that the Sulung a Mongoloid tribe from the Eastern Himalayas in Northern Assam had also been hunters and food gatherers until fairly recently and, althou[gh] they now grow some crops they still lead semi nomadic life leaving their settlemen[ts] for months at a time to range the forests [in] search of game and wild jungle products

Finally only a few months ago I had th[e] opportunity of reading a doctor's unpublished thesis by an Indian anthropology studen[t] Mr Tiwari who was writing about th[e] Rajis a Mongoloid tribe of Kumaon in th[e] Western Himalayas Like the Sulung th[e] Rajis practise some agriculture but they liv[e] largely by hunting and gathering wi[ld] edible plants To-day they are in th[e] process of assimilating the culture of thei[r] Hindu neighbours But it seems that only [a] century ago they were still nomadic hunter[s] with a culture as primitive as that of th[e] Yumbri of Siam

There are only about three or four hundred Rajis and the Yumbris may be even fewer The number of the Sulungs is not known but it is certainly small Yet the discovery of these three widely separated and apparently insignificant tribes is bound to change our views regarding the racial history of Southern Asia and the physical and cultural development of the great Mongoloid race

What has been said about the urgency of research on tribes and cultures applies also to languages Again and again we are told about languages that are only spoken by a few old people while the younger generation has completely adopted the idiom of some larger neighbouring group The Ingy language for instance which was once spoken by a large group of people in Upper Burma, was known in 1911 to only two old women. It had practically disappeared within two generations by

Of course, an ...

a few dozen people, may turn out to be a mere dialect of little interest Occasionally however it may be quite as important as one spoken by hundreds of thousands and provide key to problems of wide scope

The case of India is significant There are about twenty mill on people there who be long to the aboriginal race usually referred to as "Veddoid or Proto-Australian' They have long since given up their original languages and today the various branches of this race speak either Aryan Dravidian or Mundarian idioms—all with possibly one single exception—the small tribe of the Nahal in Central India whose language is said to be neither Aryan nor Dravidian nor Mundarian It has never been investigated properly and is now on the point of extinction Perpaps it is the last vestige of the group of unknown languages spoken by the aborigines of India before the Aryans and the Dravidians entered the country from the North West and Mundarians from the East If so its importance could hardly be over estimated Not only would it give us an idea of the ancestral languages of the twenty million Veddoids but because of the influence such idioms must have exercised through the centuries it might help us to under stand certain aspects of the languages spoken to-day by hundreds of millions in the vast sub continent of India

So Little Done So Much To Do

The number of original cultures which are insufficiently known or have never been explored is still immense Only a few years ago Wendell Bennett wrote that, considering the size of the South American continent and the cultural complexity represented signi ficant research there is still in its infancy

Practically the same may be said about India As Stephen Fuchs has observed Of the forty seven aboriginal tribes listed in Russell's book *The Castes and Tribes of the Central Provinces of India* only ten have been touched by anthropological research

The situation is particularly bad in South East Asia In Assam for instance many of the tribal cultures are still pract cally unkown Our knowledge of such an unusually interesting culture as that of the Wa on the bord rs of Bur ma and China derives practically from a single source—a superficial 26-page report by a government official who spent a few weeks in th ir country in the 1890s Yet because of its many archaic traits (head hunting slit drum the etc ... the key to many ethnological problems common to the whole of South East Asia

Like the bibliographies on South America and on India that on Indonesia is enormous But the amonut of work done by professional anthropologists is incredibly small Whole islands are still complete blanks from the point of view of anthropology

This neglect of research is due more than anything else to lack of co-ordination and appropriate information This obstacle and ways of overcoming it were the subjects of a symposium held in Vienna in 1952 during the Fourth International Congress of Anthro pological and Ethnolocgial Sciences It was suggested then that a committee be formed to stimulate and co ordinate research on particularly urgent projects Action was taken by the Congress at its fifth se sion (Philadel phia 1956) and by the International Union of Anthropological and Ethnological Sciences at its general Assembly held at the same time and place A Committee for Anthropological and Ethnological Research on Populations Threatened with Change Disintegration or Extirction was formed and I was elected as its Secretary General Unesco at its G neral Conference at New Delhi in the Autumn of 1956 accepted sponorship of the Committ e and voted a moderate amount of money which it is hoped will suffice to cover the initial costs of organization and publication

The main tasks of the committee will be to establish as complete a list as possible of races tribes cultures and languages threatened with change disintegration or extinction to co operate with universities museums learned societies foundations etc and to put its services at their disposal to publish a bulletin giving infomation about its findings pointing out particularly urgent cases and giving in formation on available personnel to accept proposals for research and in general to act as a clearing house and to stimulate in every possible way research on vanishing cultures and languages

To succeed in its endeavours the Commit tee will need the co-operation of scholars and of local residents in the various regions con cerned as well as of research institutions and foundations If this co-operatian can be secured it is hoped that the Committee will make a real contribut on to anthropology by helping to save data wh ch otherwise would be lost for ever *(UNESCO)*

INDIA AND F. A. O.

By J V A NEHEMIAH,
Of The Union Ministry Of Food And Agriculture

FAO or, the Food and Agriculture Organisation of the United Nations was founded as a Specialised Agency at the end of World War II to help particularly the underprivileged nations to achieve freedom from want The late President Roosevelt, moved by the threat of universal hunger called a conference at Hot Springs in 1943, where the idea was born to set up an international organisation to bring countries, both rich and poor, together with the common objective of redressing the tragic imbalance in economic conditions and living standards in different parts of the world through increased agricultural production

India became a founder member when 42 countries signed the constitution of the F.A.O and took the pledge to fight collectively against hunger and misery Today 77 countries are members of this Organisation

There are some who doubt whether an international agency without any legislative or executive powers can be a real action agency It is true that important proposals such as building up of a food reserve against famines as well as others that require modifications of existing structures were unable to get past the barrier of prejudice and fear Nevertheless there have been a number of promising developments which will strengthen the habit of inter governmental co-operation

Agricultural Surpluses

Although the post war period opened with heavy agricultural shortages in the last few years surpluses have begun to appear in several countries But this increase in production has taken place mainly in the well-developed countries of the West, and not in the backward zones where want continues to flourish on a scale more or less identical to that of pre-war times when there was practically no policy of international co-operation in the agricultural field. Thus the gulf that separates the countries of hunger from the countries of abundance far from narrowing has actually widened.

At this critical point the F A.O stepped to prevent repetition of what happended in economic depression of the thirties when of bags of coffee were burnt and porting countries to keep the price level artificially bolstered up while millions in other parts of the world over were virtually starving It proceeded to move its member countries to solve the distribution problem so that the surplus food might not only be made available to areas where it was most needed, but also used as valuable capital for the economic development of underdeveloped countries

First Pilot Study

The first pilot study sponsored by F A O on the uses of agricultural surpluses to finance economic development was conducted in India in 1955 A group of experts studied and reported on the idea that surplus agricultural products acquired as free grants loans or on special concessional terms could be used to raise the nutritional levels of certain groups of the population sufficiently to improve their working efficiency and thus speed up the economic development of a country

F.A O also laid down certain guiding principles in regard to the disposal of surpluses so that such transactions might not adversely affect potential grain exporters

A standing committee on surplus disposals was also set up This Committee meets frequently to help countries in the disposal and utilisation of surpluses on F.A.O principles

A good example of the way in which the Committee works and resolves difficulties is provided by the Indo-U S agreement of August 1956 for the sale of surplus agricultural commodities largely wheat Today the disposal of such surpluses in accordance with F A O principles has opened up new vistas of economic development in underdeveloped countries and has shown how international co-operation can serve humanity as a whole

Stimulus To Field Programmes

It was when the United Nations Expanded Technical Assistance Programme (ETAP) through Specialised Agencies was started in 1951, that the FAO s field programmes received real stimulus. It is under these programmes that academic discussions give place to solid action for the promotion of true economic development

obtained through F A O the services of a Dutch specialist for improving the quality of hides and skins produced by small village industries The slaughter of cattle is prohibited in U P and of the 2 2 million hides produced there annually valued at 60 million rupees more than 95% come from 'fallen animals —that is animals which have died a natural death often miles away in the open country Under these conditions the village flayer has to carry out his work under the most difficult circumstances without suitable equipment

The expert arranged training classes on improved methods of handling hides and skins He also introduced improved equipment for "carcass conversion Another innovation was to collect in gosadans animals found in a moribund or senile condition so that soon after death they may be handled by skilled flayers from the training centres By using new curing and flaying methods *chamars* are now earning 15% more than previously Also by the use of better methods the terrible stench associated with these operations is reduced to the minimum.

By 1956, no less than 24 centres had been established under this project for flaying curing and carcass utilisation six of them being run in conjunction with gosadans Besides, 32 rural tanning centres have been set up Encouraged by the success of the project the Government of India is starting a similar scheme for the whole country

Language No Barrier

Another outstanding example is the useful work done by an F A O specialist assigned to India for setting up a regional training centre for master fishermen Although neither he nor the fishermen could understand each other s language, by practical demonstration he was able to teach them as if they were men from a training school in his own native town The secret of his success was that he never asked them to do anything he did not do himself As a result of his successful methods he was requested to set up further training centres at Cochin and Tuticorin and this project—namely the development of fishermen s training center—has now resulted in a well established system being set up

Another notable example is the interest which F A O has stimulated in the control of rinderpest for many years the greatest killer disease of livestock throughout a large part of Asia India is currently engaged in a mass campaign of vaccination against rinderpest. But eradication of the disease in India without similar action in neighbouring countries such as Nepal and Pakistan would be ineffective because of the constant danger of infection seeping through from these countries F A.O is therefore, helping in the coordination of this campaign so that the problem can be simultaneously tackled in all the countries concerned

No account would be complete without a reference to the part F A O is playing in the control of locusts This dreaded plague which can create famines overnight is a recurring menace But the marked reduction in the locust visitations to this country in recent years is largely due to the effective locust control measures undertaken with the assistance of F A O in the West Asian countries where the locusts breed

Assistance From India

It should not be assumed that India is always at the receiving end with regard to F A O assistance We are in fact one of the six largest contributors to the regular budget of F A O

The introduction of new types of rice principally into the countries of the Far Eastern region is a significant contribution which the Central Rice Research Institute Cuttack has made under the sponsorship of F A O One important aspect of the work was the development of new varieties by crossings between Japonica and Indica types for the benefit of the region as a whole

In the field of agricultural statistics also Indian technicians at F A O headquarters and in other member countries are doing valuable work. In other spheres also Indians are playing an important role This will be seen from the fact that apart from fifteen Indians in the regular staff of F A O eighteen Indian technicians in different scientific fields are serving as F A O specialists in different parts of the world such as Nepal Thailand Burma Afghanistan, Iran Iraq Libya Sudan Egypt Costa Rice and Columbia

India occupies a prominent position in the F.A O and Indian delegates to F A.O conferences are held in high esteem. India is generally credited with championing any proposal however unpleasant to some members that is in the best interests of the Organisation as a whole

It was through the initiative taken by India at the Conference in 1955 that the F A.O constitution was amended to permit non self

(Continued on Page 221)

GENERAL KNOWLEDGE TEST

Test your knowledge Solve the following questions without any extraneous help When finished look up for the answers and compare Try and see.

QUESTIONS

1 What makes Indian Constitution truly democratic one ?

2 State India s stand on the Kashmir issue

3 Give in brief the aspects of Sarvodaya Movement

4 What step was taken recently by the Government of India to meet the immediate foreign exchange crisis ?

5 Discuss the progress of Red Cross work in India

6 Give the importance of the following
- (i) Porbundar
- (ii) Ayodhya
- (iii) Dundee
- (iv) Nalanda
- (v) Sindri
- (vi) Ur

7 Give the names of the authors and state the subject of the following —
- (i) Much Ado About Nothing
- (ii) *The Beggar s Opera*
- (iii) Blessed Damozel.
- (iv) Absalom and Achitophel
- (v) The Decameron
- (vi) The Innocents Abroad
- (vii) The Zind Avasta
- (viii) *Darkness at Noon*
- (ix) Jacob s Room
- (x) A Week with Gandhi

8 Who are the following and why have they been in the news recently ?
- (a) Harold Macmillan
- (b) Sukarno
- (c) Siroky
- (d) Hillary
- (e) Dr Singh
- (f) Ngo Dinh Diem.

9, *Write notes on*
- (a) Osmosis
- (b) Heliograph.
- (c) *Microtome*
- (d) Rayon
- (e) Adenoids
- (f) Coma

ANSWERS

1 Indian constitution is a unique mixture of the various constitutions of the world. It incorporated "all that is good in the constitutions of Great Britain U.S.A Australia and Japan Indian Constitution has recognised the fundamental and basic rights of a citizen, such as right to property, culture and education and free association and it has provided for the citizens of the country justice in social, economic and political spheres liberty of thought and expression of belief faith, worship and equality of status and opportunity Rights without remedies are of no use Our Constitution has made a provision for this also Article 32 guarantees to every individual the right to move the Supreme Court by appropriate proceedings for the enforcement of his fundamental rights The Supreme Court acts as the guardian of our Constitution as it has the power to pronounce judgment on the validity of laws passed by Central and State legislatures and the protector of the fundamental rights of the citizens

Part fourth of Indian Constitution embodies the provisions relating to directive principles which require the State in the national sphere to frame its *policy in such a way as to promote* the welfare of the people of India and secure for them a social order in which there is justice—social, economic and political. The Constitution provides for all the requirements of a truly democratic Welfare State and the Government is doing its best to make India a welfare state based on the socialist pattern of society

2 Kashmir was is and will be an integral part of the Indian Union and only the Parliament of India can decide the future of a component part of the Indian Union.

There is no provision in the Indian Constitution for any part of the Union to secede from it Such a provision was not something peculiar or new in the Constitution India never considered the question of Kashmir as a problem although in some quarters

there had been attempts to suggest that it was a no man's land over which somebody else had a better claim according as the U N may decide

Kashmir is not an international question at all, it is purely a domestic problem which has been drawn into the international plane because India chose to ask the U N to use its good offices to see that aggression on Indian territory was vacated

Pakistani forces have no right to be in Kashmir which was Indian territory ' legally constitutionally and logically Pakistani aggression in Kashmir must be vacated

3 Sarvodaya as a complete philosophy of life connotes welfare of all or universal development It underlines a social order ideally integrating and making the best use of the natural and the human resources, Sarvodaya discards any compartmental approach to the man—such as the Economic Man the Social Man so on and so forth—and stresses his total development Not only his material needs upto a reasonable level must be satisfied, but also the efflourescene of his indwelling spirit must be ensured Needless to say, such a philosophy, having regard and working for the 'whole man and the 'whole society can adopt only Non violence as the Means to its End As a matter of fact Sarvodaya Movement in India characterizes the third and final stage of human society i e the Rule of Love the final and second stages being the Rule of the Jungle and the Rule of Law

4 The President promulgated an ordinance on October 31 amending the Reserve Bank Act to reduce the statutory minimum currency reserve to Rs 200 crores of which not less than Rs 115 crores shall be held in gold coin and bullion and the balance in foreign securities

The ordinance was issued to meet the immediate foreign exchange crisis facing the country and enable it to honour its commitments

5 The Red Cross is a humanitarian movement conceived 98 years ago in Northern Italy It has since grown into a mighty mission

The Red Cross Society of India was established by an Act of the Indian Legislature 37 years ago All its activities are guided by and directed towards the attainment of the 'Triple-Objective — Improvement of Health Prevention of Disease and Mitigation of

The Society has multifold programme of humanitarian services which include service to Armed Forces Maternity and Child Welfare Health education, and relief on national and international level during natural calamities floods, typhoons, earthquakes and other disasters

It also provides First Aid Home Nursing and Ambulance services through the St John Ambulance Association and Brigade which act as the ambulance wing of the Society

Its well-equipped Red Cross Home at Bangalore for disabled ex servicemen is one of the pioneer institutions of its kind in Asia The Society provides military hospitals with such amenities as newspapers periodicals musical instruments and other comfort goods —all for the *Jawans* of the armed forces of our country On this part of this work alone the Society spends many lakhs of rupees every year

Distribution of milk medicines vitamin tablets things like cod liver oil, and a hundred and one other items too numerous to be listed are made available to famine stricken people and to those who have been hit by floods The supply of these goods sometimes runs into many lakhs of pounds worth many lakhs of rupees year after year

The work of the 'Juniors , one of the most active sections of the Society is a most remarkable feature With a membership exceeding 17 lakhs the Junior Red Cross gives opportunities to lakhs of boys and girls all over India to be associated with activities like the village up-lift first aid anti epidemic work and the building up of an international fraternity of youth, through *Junior Red Cross* in different parts of the world thus promoting international friendliness understanding and co-operation on that level

6 (i) *Porbunder* Port in Saurashtra, well known as the birth place of Mahatma Gandhi

(ii) *Ayodhya* Ancient city of Oudh 77 miles east of Lucknow sacred to the Hindus as the birth place of Shri Ram Chandra It is now in ruins but has an annual fair attended by about 600 000 pilgrims

(iii) *Dundee* City and seaport of Great Britain Centre of jute and linen manufactures

(iv) *Nalanda* In Bihar A famous Buddhist University flourished here from the 5th to the 12th century It has been described

(v) Sindri. Town situated about 18 miles west of Dhanbad in which the great Sindri Fertilizer Factory—the biggest of its kind in Asia—has been set up

(vi) Uri A small village in Kashmir, on the road from Kohala to Baramula where the Pakistani forces face the Indian Union forces at the cease fire line

7 (i) Much Ado About Nothing a popular comedy by Shakespearse

(ii) The Beggar s Opera a musical play by John Gay satirizing London polite society and Italian opera

(iii) Blessed Damozel a mystical symbolic love poem by D G Rossetti revised versions in 1856 and 1870

(iv) Absalom and Achitophel by Dryden and Nahum Tate - a satirical poem in heroic couplets directed agains the Whigs

(v) The Decameon by Givoanni Boccacio (Italian) is a famous collection of 100 prose tales supposed to be related by 7 ladies and 3 gentlemen in the plague stricken Florence in 1348

(vi) The Innocents Abroad, one of Mark Twain s (American) most successful and world famous books It is a rollicking tale of a tour of Europe and the East made by a group of liberty loving Americans on board the steamer 'Quaker City

(vii) Zind Avesta The sacred writing of the Parsees usually attributed to Zoroaster composed probably about the 13th century

(viii) Darkness at Noon a sensationally popular novel by Arthur Koestler (Hungarian now living in England) shedding great light on the Moscow treason trials

(ix) Jacob s Room a novel by Virginia Woolf in the stream of consciousness manner

(x) A Week with Gandhi, by Louis Fischer giving an account of his interview with Mahatma Gandhi and a glimpse of political condition of India during the Second Great World War

8 (a) The firs British Prime Minister to visit India (Jan 1958)

Mr M cmillan became Prime Minister of the United Kingdom in January 1957 after the resignation of Sir Anthony Eden During the previous 12 months Mr Macmillan had been Chancellor of the Exchequer and had experience of three other senior offices in the Party to power in the autumn of 1951 H. had been successively, Minister of Housing and Local Government, Minister of Defence and Secretary of State for Foreign Affairs

(b) Dr Sukarno is the Father of the Indonesian Revolution and in fact is its symbol His magnetic personality his organising capacity his oratory and his enormous popularity have made him the most outstanding figure in Indonesia and thus the natural choice for the Republic s first Presidency In 1927, at the age of 26 Sukarno organised the 'Partai National Indonesia (P N I) the forerunner of the present Nationalist Party and became its founder chairman He built up the P N.I on the ideals of un-compromising nationlism and full freedom His political convictions were the cause of his almost continuous exile for twelve years from 1930 to 1942, when he was freed by the victorious Japanese

(c) Mr Viliam Siroky Prime Minister of Czechoslovakia, who paid a visit to India in Jan 1958 was born on may 31 1902 in Bratislava He is the son of a railway worker At the age of 15 he also became a railway worker He joined the Social Democratic Party contributed to various socialist journals and became a supporter of the revolutionary Left wing One of th founders of the Communist Party organization in Bratislava he was elected to Parliament in 1935

(d) Sir Edmund Hillary joint conqueror of Mount Everest with Tens ng reached the South Pole on January 3 1958 the first man to get there by the overland route since Capt Robert Scott s ill fated expedition in 1912

Hillary Lading the New Zealand trans Antarctic expedition radioed the news of his success to the Ross Sea Comm ttee organizers of the expedition at 10-01 a m (G.M T)

(e) Dr S ngh Chairman of the United Democratic Party became Premier of Nepal on July 26 1957 He formed a coalition Cabinet with independents Although no official reason was given for Dr Singh s sudden resignation it was generally believed to be connected with a purge of corruption in the Civil Service during which he had appointed his own nominees to senior posts and had proposed to remove a number of officials appointed by the King Dr Singh was also reported to have offended the Indian Government by his 'isolationist foreign policy his opposition to any foreign aid, including aid from India and his decision to substitute a two-year economic plan for

Intelligence Test

(Below are given some questions to test quickness of your mind and intelligence It does not matter that you attempt all the questions What matters is the time taken by you to find the correct answers The whole paper should not take more than 30 minutes to a fairly intelligent person Try now and find out)

—QUESTIONS—

1 What would be the most useful thing to do first of all if you saw a man in a deserted street smash a jeweller s window steal some rings jump into a car and drive quickly away ?

(b) run after the car
(b) fetch a policeman
(c) tell the people in the shop
(d) take the number of the car
(e) cry stop thief

2 If the word THAW would appear as the same word if seen in a mirror write it down If it would form a different word write the first second and third letters of WORSE if it would not look a word at all write the first two letters of BETTER

3 Rearrange the words in the following sentence to make them as sensible as possible Do this in your head and state whether the statements are always true occasionally true usually true or are false

(i) If ponds freeze very cold it will is
(ii) in the sun shine midnight does not at England
(iii) milk milkmen deliver the to forget
(iv) young girls like play with to dolls
(v) they to stations go petrol buy motorists when petrol
(vi) the cry at the cinema pictures people shown make
(vii) an egg cannot make an omelette without breaking it

4 Point out any absurdities in the following

(a) It took me a long time to cycle to your house but the wind has changed completely round so that I shall travel much faster on the way home

(b) (A notice displayed on an optician s window) If you cannot read this notice come inside and have your eyes tested

(c) I often write with my left hand, for I can write as well with one hand as with the other—in fact better

(d) It is quite lawful for a man to marry his widow s sister

(e) Here are some sights which the visitor to Shoreville must not see the War Memorial, the old Church the fine forest the view from the headland and last but not least, the smell of the briny ocean

(f) Some young men were in the police court answering a charge of loitering 'If everyone were to stand on the pavement said the magistrate how could any one get by ?

5 Which two words of the five in brackets in each line are connected with each other in the same way as the first two words in that line ? (e g boy girl man young woman baby old)=man and woman

(i) King queen (prince, duke princess earl president)
(ii) Oar boat (beak wing bird egg bacon)
(iii) Pig pork (bread cheese, sheep lamb mutton)
(iv) One two (thirty forty fifty sixty)
(v) Arm hand (leg knee foot wrist elbow)
(vi) Ship sea (camel lion, tiger desert abandon)
(vii) Footballer goal (run walk cricketer bat handle)

6 A train leaves Delhi every hour 24 hours a day A train leaves Kanpur every hour 24 hours a day It takes six hours for the trip from Delhi to Kanpur It takes six hours for the trip from Kanpur to Delhi You are on a train which leaves Delhi for Kanpur at eleven in the morning As your train pulls out of the Delhi station a train from Kanpur is just gasp-

ing out its last clug as it slowly comes to a halt

Including this incoming train how many trains will you see coming from Kanpur to Delhi throughout your trip

7 A tradesman marked his goods in a code He made $b=1d$ $c=2d$ and so on. He made $C=1s$ $D=2s$ and so on What prices were the goods which he marked in the following way ?

(i) Fh (ii) Hd (iii) Me (iv) Pf (v) Ji (iv) Sg

8 Read through the following passage as carefully as possible You should not spend longer than a minute and a half on it

I established with myself, on these occasions the reputation of a first rate man of business—prompt, decisive energetic clear, cool headed When I had got all my responsibilities down upon a list, I compared each with the bill and ticked it off My self approval when I ticked an entry was quite a luxurious sensation When I had no more ticks to make I folded all my bills up uniformly docketed each on the back and the whole into a symmetrical bundle Then I did the same for Herbert (who modestly said he had not my administrative genius) and felt that I had brought his affairs into focus for him

My business habits had one other bright feature which I called 'leaving a margin For example supposing Herbert s debts to be one hundred and sity four pounds four and two pence I would say Leave a margin, and put them down at two hundred Or supposing my own to be four times as much I would leave a margin and put them down at seven hundred I had the highest opinion of wisdom of this same Margin but I am bound to acknowledge that on looking back I deem it to have been an expensive device. For we always ran into new debt immediately to the full extent of the margin and sometimes in the sense of freedom and solvency it imparted got pretty far into another margin

The following three statements are based on the passage above. They may be either false or true Without looking back but relying entirely on your memory say which you think they are

1 Leaving a margin was an expensive device

2 But it did prevent us from going into new debt immediately

3 The sense of freedom and solvency that I gained from my system was a great spur to Herbert s business activities

(ANSWERS)

1 d

2. BE.

3 (i) Always true, (ii) Always true (iii) Occasionally true (iv) Usually true (v) Usually true (vi) Occasionally true (vii) Always true

4 (a) If the wind had changed completely then it would be against the cyclist on his return journey also

(b) If a person could not read the notice then he could not be expected to take the advice that the notice gave

(c) If I write as well with one hand as with the other I cannot write better with one hand than with the other

(d) A wife is a widow only when her husband dies

(e) A smell cannot be seen (the smell of the briny ocean)

(f) If every one stood on the pavement there would be no one left to get by

5 (i) Prince Princess (ii) wing bird (iii) sheep mutton (iv) thirty sixty (v) leg foot (vi) camel, desert (vii) cricketer, run

6 Since it takes six hours to make the trip from Kanpur to Delhi the train which pulls into Delhi had left Kanpur at 5 a.m You will arrive at Kanpur 6 hours later, or at 5 p m You will therefore pass trains that leave Kanpur at the following hours 5 a m 6 a.m , 7 a m 8 a m 9 a m 10 a m 11 a m. 12 p.m 1 p.m 2 p m., 3 p m , 4 p.m. Of course at the exact moment you pull into the Kanpur Station a train will be leaving for Delhi If you are alert, you will also see this one The answer then is thirteen trains

7 (i) 4s. 7d (ii) 6s 3d (iii) 11s 4d (iv) 14s 5d. (v) 8s 8d (vi) 17s 6d

8 1 True 2. False 3 False

LETTERS to the EDITOR

Letters from the readers giving their own opinion or point of view on all interesting subjects are published in these columns Letters should be brief to the point neatly typed double space They may be written under a pseudonym but must be accompanied by writer s name and address The views expressed here do not necessarily reflect editorial opinion or policy

THE CASTE SYSTEM

Sir

The problem of cas e system is a burning issue in our country Inspite of the best efforts of great men the evil has been caus ng much harm to our social solidarity Recent happenings in Madras have made re-thinking over the issue obligatory Not only in Mad ras the system is in vogue almost all over the country, albeit it is observed without giv ing rise to violent activities It is deeply rooted in our social system and those who are denied of equal rights do not generally raise any voice because of some psychological weak nesses engendered in them since their very birth

The problem can best be viewed through historical perspective India is familiar with the caste system from time immemorial It was deliberately developed with the object of making social living possible and feasible In a primitive society division of labour was as necessary as it is to-day But specialisation in ancient days could be achieved by a person who would follow the profession of his father The division was not however rigid and interchange of works between different groups was socially recognised But through time class rigidity has become prominent What was evolved as a system of social progress has be come with the advancement of civilization an impediment that should be done away with immediately

The reason why the system has got to be abolished is clear enough In a primitive society social living could be made possible by sacrificing to a great extent individual talents and desires human rights and opportu nities In an industrial and scientific civiliza

Here there is enough scope for the develop ment of individuals in an organised society In an industrial society a worker acquires skill and knowledge not from his father but from an educational in titution He has greater opportun ity for his own development according to his desires and aptitudes Moreover the funda mental rights of man have stood the test of logic

There are some definite causes which lend support to the persistence of caste system in our country First our educational backward ness is to be taken into account Through education a liberal and rational mind can be trained. Secondly the predominence of the agricultural sector in our economy which bears testimony to our ancient order of society is a favourable factor in the perpetuation of the system. As the sector is not technically modernized traditional skill and social environ ment have not been unsuitable for production and distribution In other words industrial backwardness has helped though indirectly to perpetuate the system

Considering the gravity of the problem it may safely be asserted that some legislative measures are not sufficient in this regard It cannot be the business of a man to report to a court whenever he is insulted on ground of caste distinction The measure is not only embarassing to follow it is practically im possible of implementation since in most cases the objectors are not in a position to bring the issue before a court Socially as well as economically he is too depressed to do so Expansion and improvement of education and widespread industrialization are very effec tive antidotes but these are comparatively long term measures An organised campaign

tutions in rural India may go a long way in eradicating the evil from our social system

Bankura — Yours etc

DISARMAMENT AND PEACE

Sir,

Notwithstanding the much discussed issue of disarmament nothing concrete has been achieved so far towards th s On the contrary the statesmen of two opposite camps believe that if you want peace be prepared for war resulting in a cut throat competition of stock piling of armaments on both the sides

Man always wants peace but it is a para dox that his pious desire is always overpow ered by his bestial and diabolical instincts But how long will this tendency of man be allowed to run? The imperative need of the hour is not only to avert the third world war looming large before us but to create such an atmosphere where permanent peace is restored not only for to-day but for the posterity as well So mere lip-service to the question of disarmament will not solve our problem

The main reason why all the attempts of disarmament have so far ended in fia_co boils down to the political tension between the two diametrically opposite camps i e Democracy and Communism The villain of the piece is the deep-rooted distrust and suspicion between these two rival camps The problem is how to break this vicious circle

The real solut on to the problem is to evolve some sort of International outlook in the minds of men so that everybody should start thinking not in terms of his own country and creed but in terms of the whole world

And this will not happen until ethical values are accepted as a paramount factor in politics There is the need to evolve out some sort of ethical and moral institutions not only for ourselves but for the posterity as well otherwise we will be held responsible for making this world the wonderful creation of God, a barren land devoid of any living being

Khagaul — Yours etc
12 1 1958 — A.B Prasad M.A.

SPLENDOUR AND CHARM OF INDIA

Sir

We have gone through one of the articles in your monthly magazine, 'Careers and Courses" of December 1957, captioned as the 'Splendour and Charm of India Almost all the worth-enjoying things of almost all the provinces of India have been mentioned but surprisingly enough the charms and beauties of Assam appear to have been over looked. At any rate, it is not denying the fact that at present Assam is drawing attention of a large number of tourists from other countries for the charms and beauties of Kaziranga and the rhinoceros and the charms and grandeur of the capital city like Shillong, with its pine-woods and transparent lakes in which various kinds of fishes are found. The temple of goddess Kamakhya bearing the interesting history of the Asura King Naraka on the Nilathal Hills just making a cliff by the river Brahmaputra side, we think is no less a charming sight than some of the important temples in other parts of the country The Sibsagar district where the ancient capital Rangpur is situated, is no less a historically important place with its sculpture and inscription as engraved on Rang-ghar Talatalghar Jaydoul, Sivadoul etc than other historical places in India

May we then venture to ask the writer about the position of Assam in India in regard to her splendour and charm? With pictures que and rare varieties of animals some of them being characteristic of the land does not Assam qualify herself to secure any consi derable position in India with the other sister provinces?

Shillong — Yours etc
5 1 1958 — C C. Kalita
Prafulla Mohanta

(We would gladly print an article on the scenic and natural beauties of Assam provided some one writes about it and sends the article to us. —Ed C & C.)

PETROLOGY

Sir,

I was surprised to read the definition of Petrology given by you in your issue of February 1958 on Page 128

So far as I know 'petrology is the science which deals with the modes of occurence and origin of rocks and their relation to geogical processes and history

Petrology includes **petrography** (the study of rocks as specimens purely from the chemical mineralogical and textural points of view) and **Petrogenesis** (the study of origin of rocks)

Poona Yours etc.
30 1 58 H V Mathur M. Sc

* * *

Sir,

In your issue of February 1958 you have written that Petrology means science of petroleum This answer is wrong and is misleading 'Petrology which forms a branch of Geology means study of rocks Literally also Petrology means study of rocks and nothing else

Lucknow Yours etc
1 2 1958 D N Ghosh B Sc

(The word *petra* means rock. Other words connected with *petra* are *petraglyph* rock carving *petragraph* rock inscription *petragraphy* scientific description of formation and composition of rocks The world *petroleum* is also derived from *petro* (rock) and *oleum* (oil) —Ed C & C.)

Question Box

In these columns we answer the queries from our readers. It may not be possible to answer each and every question but a considered reply shall be given to selected questions. Letters from our readers are welcome. These should be addressed to the **Editor, Question Box**

POLITICS AND PSYCHOLOGY

Q. Examine the limits and merits of Psychological approach in modern Politics.

(*Ramji Prasad, Muzaffarpur*)

Ans. A politician has to deal with the masses on the one hand and the Government on the other. To gain popularity among the masses, to win their confidence, to bring home to them his policies and to induce them to follow him requires a psychological approach. It is not only desirable but is also necessary and no limits can be put to it. The success of his dealings with the Government primarily depends upon the strength of his following. But even psychological approach is helpful. In this field of his activity the scope of psychological approach is limited because of the peculiar set up of the Governmental machinery.

MINISTER OF STATE AND DEPUTY MINISTER

Q. Please give a comprehensive note on Minister of State and Deputy Minister in Central Government.

(*A. A. Ansari, Patna*)

Ans. A Minister of State is a full fledged minister head of a ministry as the Cabinet Minister is except that he does not attend Cabinet meetings. The Deputy Minister is subordinate to a Cabinet Minister or the Minister of State.

VISHWA BHARATI UNIVERSITY

Q. In what respects does Vishwa Bharati University differ from other Indian Universities?

(*A. D. Majumdar, Khurja*)

Ans. Most of other Universities like Calcutta, Madras and Bombay Universities were established by the Government under an act and they were primarily meant to be examining and affiliating bodies while the Vishwa Bharati was founded with certain ideals and was recognised only after India attained independence. Vishwa Bharati is a residential university with a cultural bias.

INDO PAK RELATIONS

a new ministry headed by a Republican Prime Minister has been formed in Pakistan.

(*M. Nooruzaman, Ranchi*)

Ans. The personality of the Pak Prime Minister and the character of the party he comes from may influence Indo-Pak relations but in the present case no change is expected. The basis of hostility is the rivalry of the Power Blocs and the Two-Nation Theory propounded by late Mohammad Ali Jinnah. Parallels can be found in Korea and Indo-China. So we cannot accept any betterment of Indo-Pak relations unless pakistan gives up her theocratic character and there is amity between the two Power Blocs.

THE FIRST LADIES

Q. Pease tell (i) who was the first Indian lady to be appointed Governor of a province (ii) the first Indian lady to become minister in a province.

(*Kidar Singh, Delhi Cantt.*)

Ans. (i) Sm. Sarojini Naidu, the Governor of U.P.

(ii) Sm. Vijay Laxmi Pandit, Minister of Local self Government in U.P.

WEALTH-TAX

Q. Please briefly describe the Wealth Tax.

(*M. Khalid Kalam, Gorakhpur*)

Ans. The Wealth Tax was described by the Finance Minister as egalitarian in effect but without a disincentive effect. It will be levied at rates ranging from 5 per cent to 1.5 per cent on wealth valued over Rs. 2 lakhs in the case of individuals and over Rs. 3 lakhs in the case of undivided Hindu families. There will be a flat rate of 5 per cent in the case of companies for which the exemption limit will be Rs. 5 lakhs. Seven categories of properties will be exempted from this tax. The yield is estimated at Rs. 15 crores.

U.N.O. MEMBERSHIP

Q. What is the total number of U.N.O.'s membership and which important countries

Ans Total number of U N O member ships is 82 China is one of the most important countries which is not allowed to be its member

SIGNIFICANCE OF 'BABY MOON

Q May I request you to enlighten me about the effects of the launching of Baby Moon, on the present day world affairs ?

(*Pankaj Kumar Gupta, Calcutta*)

Ans The launching by Russia of a Baby Moon in October and of another in November 1957 was a great step forward in the progress of science It has opened up the possibilites of space travel and people can look forward to a visit to the Moon In the political field it brought a great deal of prestinge to the U.S.S R. Since then, the U S A has also sent up a Baby Moon thus showing that it is not far behind Rivalry in science created by the Baby Moons may ease poli tical tension

AGRICULTURAL COLLEGES

Q Please name the Agricultural Colleges in India

(*Chabiram Brahma, Gauhati*)

Ans Govt Agricultural College Barpeta (near Jorhat Assam)
Secondary Agricultural School Chainsura (Bengal)
Agricultural Institute Barrackpore
College of Engineering and Technology Jadavapur (Bengal)
Bihar Agricultural College Sabour P O Distt Bhagalpur
College of Agriculture, Poona
College of Agriculture, Anand (Bombay)
College of Agriculture, Nagpur
G S College of Science and Agriculture, Khamgoan
Central Agriculture College Anand Parbat Delhi
Khalsa College Amritsar
Agriculture Institute of Plant Industry, Indore
Agriculture College Bapatla (Andhra)
Agriculture College Coimbatore
Mysore Agricultural School Hebbal Farm, P O Bangalore
Agricultural College and Research Institute Bebbal P O Bangalore
Osmania University Agriculture College Hyderabad
Agricultural School Bulandshar Gorakhpur and Ghazipur
Allahabad Agriculture Institute Allahabad
Agricultural College Kanpur
Balwant Rajput College, Agra and K E M Udaibhan Jat College Lakhoati
Intermediate College in Agriculture Baraut (Distt Meerut)
Agriculture College Banaras University Banaras

TELECOMUNICATION—TRAINING

Q Please suggest me a course concerning Line of Communication

(*Iqbal Raj Bhasin New Delhi*)

Ans This particular branch of techno logy training is povided in some of the Engineering Colleges The important ones are —

Faculty of Engineering Bombay University Bombay
College of Engineering Poona
Government Engineering College Jabalpur
College of Engineering Guindy Madras
Maharaja s Technological Institute Trichur
Indian Institute of Science, Bangalore

CINAMA TERMS

Q Please explain the following —

1 Twentieth Century Fox
2 Colour by deluxe
3 Cinemascope
4 Cinematograph
5 Feature Film
6 Hit Movie

(*Duli Chand Pachmarhi*)

Ans 1 Twentieth Cetury Fox famous American Film Producing company

2 Colour by deluxe It indicates by whom the colouring of the film has been done

3 Cinemascope A particular type of film which provides a broader view of the scene presented

4 Cinematograph The science of mak ing films

5 **Feature films** They are the main films exhibitied in cinema halls as against the short films

6 Hit Movie It is a film which has been a success with the cinema fans

STUDENTS' EMPORIUM

THE BEST TIME FOR READING

When is the best time to read a book ? Only the most passionate reader would answer "Any time ! For most of us have our prefer ences of time as of place

Old age or youth ? Winter or summer ? Morning or night ? Each has its devotees and many a recorded favourite reading time shows how varied—and how interesting—this aspect of a love of books may be

Speaking of the seasons Charles Lamb found he could never read much in the sum mer, and more than one poet has extolled the delights of winter reading

For summer reading however Edward Dowden recommends Chaucer when you are not in an intense or an heroic mood ' and it has been said that Theocritus harmonises ex actly with the onset of fine weather

Edward Fitzgerald held that Southey s *Life of Cowper* was hardly the best reading at the fall of the leaf and that to read *Seneca* in February was some-what odd In contrast Leigh Hunt s opinion was that *The Arabian Nights* was the book for all seasons

As for the time of day late reading has always been more popular than the com panionship of books in the early morning But early rising readers do occur, and they are in good company

John Milton rose hab tually before other men awoke, to read good authors and Samuel Pepys thought nothing of getting up at four o clock in the morning to digest the Second Oration of Cicero

When in India Lord Macaulay read ancient literature every morning from five to nine Robert Louis Stevenson was another who loved to read in the early hours but not the classics for him Virgil and the rest were "not good fun on an empty stomach

But not so Dr Johnson Since he left Oxford he said he could never remember a time when he rose early save when writing under pressure of financial need *The Rambler* oddly enough it was Burton s *The Anatomy of Melancholy* that became in Boswell s words the only book that ever took him out of bed two hours sooner than he wished to rise "

Like so many of us Johnson preferred to sit up late reading In one of his celebrated letters, Lord Chesterfield admitted that he often read all through the night, going to bed at six in the morning

This practice of nocturnal reading has been carried to greater excess than reading at any other time Many have been the recipes for keeping awake at such times Copious draughts of strong black coffee wet towels and vinegar compresses the use of hard uncomfort able chairs to ward off sleep even in the case of the Chinese scholar Sun Ching of tying his pigtail to a beam above his head to prevent himself from dozing as he read!

Surely however the best aid to keeping awake is simply a good book How well we know the reverse to be true!

Books have long been the surest antidote to boredom caused by waiting, or having nothing to do Cases of bookworms reading surreptitiously in churches during service are almost as common as those of sleeping openly in like circumstances

And what immense relief in *ennui* have books given in countless ante rooms waiting rooms cells and queues!

This is most true when books are read to counteract the monotony and boredom of travel Since man first read books he has read them on journeys from Pliny in his chariot and Napoleon in his bookshelf fitted coach to Lawrence on his camel riding across the Arabian Desert with the Bedouins reading Aristophanes and the avid modern reader to be seen in every long distance air liner

The sense of movement somehow spurs one on Save at sea in a storm, as one writer points out there is no form of travel that may not be spent in reading

But as railway station bookstalls prove it is the train journey that encourages us to read most

Trains and readers have gone together since the first were invented As Viscount Grey categorically states A long railway journey affords a first rate opportunity for reading "

It was left to Aldous Huxley however to define the ideal book for this kind of reading

"A travelling book he wrote is one that you can open anywhere and be sure of finding something interesting which does not require continuous attention or prolonged mental effort

At what other times are books read with most pleasure ? By tradition that is certainly ancient we are expected to read at the hair dressers nowadays mostly when awaiting our turn but also, if a lady, whilst undergoing the rigours of drier or waving machine

In earlier times men read whilst the barber was at work or were read to whilst being shaved Pliny records having books read to him whilst being rubbed and wiped in the bath and Pepys often read whilst his maid dressed or combed his locks

George Wyndham with the book at his elbow would commit Shakespeare s *Sonnets* to memory while shaving and a great volume of profitable reading has doubtless taken place during the more intimate forms of toilet

In battle and in prison on a sick bed or threading one s way through the crowded streets of a big city, a book may inimitably overcome both time and place Indeed as John Aikin put it no apparatus no appointment of time and place is necessary to read Reading is surely the only art which given the single essential of sufficient light to see the book by can be practised at any hour of the day or night whenever the inclination is there

Holbrook Jackson s dicta are worth remembering

The time to read is now not hereafter We must make or miss our joy Never put off till tomorrow the book you can read today

Any time is the proper time to read but by far the best time is now

NAVY S ENGINEERING TRAINING CENTRE

In the historic outskirts of Lonavla a lovely hill station between Bombay and Poona is situated I N S *Shivaji* the Navy s Engineering training establishment The Navy could not have perhaps chosen a better site to train the country s youth than this region which is rightly proud of its association with the famous Shivaji and where nature has showered her blessings

The establishment of a new Naval Engineering College here last year has given additional importance to INS *Shivaji* Responsible for the training of mechanical engineer officers and artificers for the service, this establishment has now started some new course of the junior officers for which hitherto they had to be sent abroad

It is primarily a training establishment for Artificer Apprentices Matriculates between the ages of 15 and 17½ are selected as Artificer Apprentices A limited number of Apprentices are recruited every six months They receive intensive training which includes technical and educational training Workshops and Demonstration Rooms elaborately equipped are available for practical training When it sees the raw recruit diffident and shy at first leave the portals of the Establishment after his training as a fully trained technician smart and self confident *Shivaji* feels the rightful satisfaction of having done something really worthwhile

The Navy affords a splendid opportunity to these selected apprentices to receive advanced technical training which is absolutely free They also receive pay during training After training they have to serve 15 years on active service and ten years in the Fleet Reserve Normally after their initial term of service is over they are permitted to serve a further period to qualify for pension

Engineer Officers on completion of their initial Divisional Course in I N S *Venduruthy* Cochin come to *Shivaji* for their professional training The training of Senior rates who are selected as Mechanics as well as the training of Stokers is carried out here

' A happy Ship is an efficient Ship is an oft repeated maxim but a very true one. Hard work there is and there should be in a Training Establishment and work is conducive to happiness But it is not at all work and no play in *Shivaji* Facilities exist for all kinds of outdoor and indoor games The trainees evince keen interest in these games. Every one has to play compulsorily some outdoor game or other in the evening *after working hours Keen and healthy* competition exists between Divisions into which the trainees are divided to win the laurels on the sports field *Shivaji* has a good record in the services games and sports events and hopes to maintain it and even bettering it There is a good swimming pool in the establishment and aquatic sports are very popular

The trainees make full use of the well equipped library in the establishment Books and periodicals published in English and

most of the Indian Languages are available The Camera Club the Hobbies Club the Dramatic Club and the Deep Sea Scouts troupe organised by the trainees under the able guidance of their Instructors are flourishing well Lately the shramdan movement has 'won' over many an officer and rating at *Shivaji* As a result a number of improvements have taken place here

New buildings are springing up here in place of old wartime stuctures in which the establishment has been housed

"Hard work, good play, healthy hobbies and active habits"——that in short, describes life in I N S *Shivaji* which aims at making the trainees efficient members of the Service and responsible citizens of the country

* * *

CRAMMING TO BE DISCOURAGED IN U P

The general tendency of students to cram up bazar notes for passing school final and junior college examinations is sought to be checked by the U P Board of High school and Intermediate Education through examination reform

The first step in this direction was taken by tha Board recently when it issued a directive to all schools and second grade colleges to change their method of teaching and adopt a new pattern of questions to be set for the examinations To begin with the Board has asked the education institutions to try the new experiment with the teaching of English language only

Reforms in the teaching and examination of other subjects will follow the pattern depending on the experience gained from the first trial Another reason for taking up the reform of teaching English is the desire to combat the general complaint about the deterioration in the standard of teaching in schools and colleges during the last few years.

The teaching methods for English will hereafter be directed towards enabling the students to understand the structure and idiom of the language Instead of testing their camming capacity as hithero stress will be more on intelligence and less on memory The question papers will accordingly be modelled in every aspect of the English language

All the schools and intermediate colleges are belived to have been directed to give sufficient number of test exercises in the class room before sending students in March to face the new type of question papers in the examination hall

*

BRUSH ABOE GROUP SCHOLARSHIP

The Brush Aboe Group of Companies in the United Kingdom have offered one scholarship for the practical training of an Indian National in their factories in the United Kingdom.

The value of the scholarship which is tenable for two years is £ 10 6s 4d per week In addition the Group will also provide free return passage from the place of the trainee's residence to the place of training in the United Kingdom.

Candidates should have a first class degree or an equivalent qualification in Mechanical or Electrical Engineering and should have graduated in 1957 Graduates of 1955 and 1956 may also be considered if they have exceptionally good practical experience in their chosen profession

Application forms can be had from the Ministry of Education and Scientific Research Scholarships Division (S-18 Section) New Delhi

The last date for receipt of applications in the Ministry through the Head of the University or Institution last attended by the applicant is March 15 1958

* * *

GUIDE TO CAREERS—TEACHERS

A Primary School Teacher's work is to look after and teach children during the first four and five years of their life at school from the age of about six to ten or eleven Their mother tongue reading writing arithmetic social studies and elementary science are taught and they are generally directed and encouraged in their social activity and play A record of their attendance and activities is maintained and the development of essential habits of hygiene health good manners clear expression and a co-operative spirit is encouraged

Working conditions in a primary school are usually congenial hours of work being fixed usually extend from 10 a m or 11 a.m. to 4 p m Vacations and holidays are allowed with pay Normally a teacher has to handle a class of 35 to 50 pupils though occasionally the classes may be larger

To Qualify, primary school teachers are generally required to be matriculates although there are many who have passed only the middle school examination To take up teaching as a career training in a teacher's training school is necessary and a certificate has to be obtained The training extends over a period of one to two years Almost all the State Governments have set up their own training

Subjects of study are usually —

(i) The principles of education including the principles of curricular construction
(ii) child study and educational psychology
(iii) practical assignments
(iv) school organisation and administration
(v) methods of teaching and
(vi) rural reconstruction and social education

The cost of training for untrained teachers, recommended by their employing schools is usually nothing but they have to pay for boarding lodging and other maintenance expenses which vary from place to place Fresh matriculates joining a training course might have to pay a nominal monthly tuition fee of about Rs 5/ p m

Further training in higher studies can usually be pursued as private candidates Some universities offer facilities to teachers to appear at their examinations as private students After graduation a teacher can complete a year s training course in a training college in order to obtain a teaching degree and qualify for employment in high schools

Personal Qualities necessary for the job are a pleasant temperament patience vitality and above all love of children He (or she) must have the educator s keenness to spread knowledge and a desire to be a model to the pupils Persons with physical defects such as an impediment of speech poor hearing and nervous disorders are likely to be handicapped in the teaching profession.

Entry into the Profession is bound by no hard and fast rules but there has been a growing realisation of the need to provide adequately trained teachers for primary schools Appointment may be made by the governing authorities or the managing committees (in the case of privately managed schools) by the inspecting officers of the Education Department (in the case of Government schools), or by the chairman or the Selection Board (in the case of Local Bodies) In U P no uncertified teacher can be appointed permanently in a recognised school In Travancore Cochin every new teacher has to apply for a licence within three months of appointment The holding of a licence carries with it certain guarantees In Madhya Bharat and Kutch the appointment of a teacher rests with the Inspector or Inspectress of Government schools In Saurashtra appointments are made on the basis of merit through a competitive examination

Openings for primary school teachers are available in Government as well as private schools Primary schools are also run by Local Bodies (Municipal Committees District and Cantonment Boards Janpad Sabhas, etc.) Defence Services and the Railways Nearly 92 per cent of the total number of teachers are employed in schools under the control of local and private bodies

Salaries in recent years have improved as a result of demands of primary teachers to raise their salary level Such demands have met with widespread sympathy and most of the State Governments have raised salary scales of primary teachers and improved their terms of employment. The salary scales of teachers differ from State to State and often within the same State

Most of the States do not differentiate between the pay scales of men and women teachers However in Madhya Pradesh Vindhya Pradesh and Bhopal women teachers get a slightly higher salary

Prospects for Advancement exist in the teaching profession for the right type of person A teacher can rise to the post of headmaster or mistress, when a higher scale of salary and additional allowances can be expected An ambitious primary teacher can find ample scope and time to improve his qualifications by pursuing higher studies in order to be eligible for better paid jobs in high schools and the education departments

For Further Information on training facilities you may contact

(i) The Directar of Education/Public Instruction of your State
(ii) The Employment Exchange nearest your home

Employment Outlook

With universal free and compulsory primary education as the goal accepted by the Government of India the country will need an army of primary teachers Out of 1 12 million teachers necessary to implement the programme of universal education only about 467 000 teachers are as yet in employment out of whom more than 5 per cent are untrained teachers and less than 5 per cent have passed the Matriculation examination There is such a shortage of trained teachers in the country that almost anybody who satisfies the minimum requirements of the profession can be sure of securing a job somewhere

Basic schools are gradually replacing the traditional primary schools as basic education has been accepted as the national pattern of

most of the Indian Languages are available The Camera Club the Hobbies Club the Dramatic Club and the Deep Sea Scouts troupe organised by the trainees under the able guidance of their Instructors are flourishing well Lately the 'shramdan movement has won over many an officer and rating at *Shivaji* As a result a number of improvements have taken place here

FORTHCOMING EXAMINATIONS

(i) Indian Navy Examination June 1958

The Union Public Service Commission will hold an examination at Allahabad Bombay, Calcutta Delhi Hyderabad Ludhiana Madras Shillong and Srinagar some time in June 1958 for selection of Special Entry Cadets for the Indian Navy

AGE LIMITS —Candidates must have been born not earlier than the 2nd July 1939 and not later than the 1st July 1941 THESE AGE LIMITS CAN IN NO CASE BE RELAXED

Qualifications —Intermediate or equivalent Applications from candidates who have appeared or intend to appear at Intermediate or equivalent examination acceptable provisionally **Application forms and full particulars** obtainable from Secretary Union Public Service Commission Dholpur House New Delhi by remitting Re 1/ by money order or on cash payment at the counter Candidates must clearly state on money order coupons 'INDIAN NAVY EXAMINATION JUNE 1958 and also **give their name and full postal address in block letters** Postal orders or cheques or currency notes will not be accepted in lieu of money orders Application forms and connected papers are also obtainable free from the nearest Naval Office ONLY UNMARRIED MALE CANDIDATES CAN APPLY FOR ADMISSION TO THIS EXAMINATION Completed applications must reach Union Public Service Commission by 15th March 1958 (29th March 1958 for candidates abroad.

(ii) Assistants Grade (AFHQ) Examination May 1958

The Union Public Service Commission will hold at Delhi and London, some time in May 1958 a limited competitive examination for recruitment to permanent vacancies of Assistants in Armed Forces Headquarters The examination is open only to certain categories of (i) departmental candidates working in the Armed Forces Headquarters and (ii) employees of the AFHQ, who are on deputation to other offices Full particulars and application forms obtainable either from the Secretary, Union Public Service Commission Dholpur House New Delhi or from the Chief Administration Officer Armed Forces Headquarters, New Delhi Completed applications must reach the Secretary Union Public Service Commission by the 15th March 1958 (29th March 1958, in the case of candidates residing abroad)

(iii) Special Class Railway Apprentices' Examination, May 1958

The Union Public Service Commission will hold an examination sometime in May 1958 for selection of Special Class Apprentices for the Mechanical Engineering and Transportation (Power) Department of Indian Railways AGE LIMITS 16 19 years on 3rd August 1957 Upper age limit relaxable in case of Scheduled Castes Scheduled Tribes, bona fide displaced persons from Pakistan and unliberated areas of Jammu and Kashmir residents of former French settlements which have now become part of India whose medium of instruction has been French and candidates belonging to the Andaman and Nicobar Islands QUALIFICATIONS —Candidates must have passed in first or second division the Intermediate Examination with Mathematics and at least one of the subjects Physics and Chemistry or possess one of the alternative qualifications prescribed in the Rules Applications from candidates who have appeared or intend appearing at the qualifying examination acceptable provisionally Application forms and full particulars obtainable from Secretary Union Public Service Commission Dholpur House New Delhi by remitting Re 1/ by Money Order or on cash payment at the counter Candidates must clearly state on Money Order coupons **Special Class Railway Apprentices Examination May 1958** and also give their name and full postal address in block letters Postal orders or cheques or currency notes will not be accepted in lieu of Money Orders Completed applications must reach the Union Public Service Commission by 1st March 1958 (15th March, 1958 for candidates abroad)

Interviews WITH SUCCESSFUL CANDIDATES

INTERVIEW WITH SHRI VISHNU SWAROOP P.C.S.

Shri Vishnu Swaroop was born in a middle class family. The circumstances of the family compelled him to face struggle in life from the very start. He took his LL.B. degree from Lucknow University and in the whole of his academic career he always got 2nd Division Marks in his examination except for the High school and LL.B. (Previous) where he secured First Division. Shri V. Swaroop, who secured 2nd position in the U.P. Commission's combined competitive examination for the Provincial Civil (Executive) Service held in 1956 when interviewed by our correspondent said:

"My career so far has been of trial and error. No disappointments could shake my faith in the fruition of my labours. In my moments of disappointment the teachings of Gita and the lives of great men inspired me and encouraged me.

Correspondent: What do you think about the competitive examination?

Shri V. S.: Although I have treated them as a lottery, I feel every one must do his part well. By lottery I mean no body in however bad circumstances needs to feel frustrated. Taking my own example, I was in none too happy circumstances or sure to succeed, yet I have secured second position.

Correspondent: What should in your opinion be the method of preparing for a competitive examination?

Shri V.S.: I do not believe in any rigid method. Broadly every candidate must have his ultimate aim before him constantly giving it priority over all other things.

As regards the various papers in which he has to appear in the examination, the candidate should be vigilant to see that he arranges his studies in such a way that he is able to prepare for all papers in the best possible way. He should not leave any gaps that may trap him unexpectedly.

I myself have always been planning my studies according to the time at my disposal because it is almost impossible to read everything on a topic. When one is preparing for more than one examination simultaneously, he should try to opt for papers common in both or all the examinations and put emphasis on subjects which are to pay him the most in those examinations. If one's immediate aim is to succeed in a competitive examination, he should not waste his energy in going in great details about the subject, but should try to master that portion of the subject which

Shri Vishnu Swaroop

is of immediate importance from the point of view of the examination. For General Knowledge and Essay papers of course one should read widely. One should pay special attention towards developing his power of expression which is the most important thing in a competitive examination. No amount of labour undertaken for this would go waste. Incidentally, I

may also express my appreciation of the journal that you represent I am of the opinion that a *candidate* can very safely make your journal a sort of basic companion for his general studies It helped me especially to avoid any ramblings

Correspondent I don't think you found any leisure for games etc during past few years when you were busy both in office and in preparing for competitive examinations

Sri V S No Sir your presumption is wrong *I did* have my moments of boredom and fatigue and I always spared some time for relaxation and amusement Not only have *I been playing one or the* other game or visiting cinema houses to relax but I could also successfully learn swimming and Volley Ball *which were new to me Besides* I could pursue of course to a limited extent, other of my hobbies like photography picnicking etc too These diversions helped me a lot to stand the hard labour that I had to put in during these years The only thing that I missed was hearty sleep but I have experienced that a well regulated though limited sleep is equally sufficient to refresh the mind and invigorate the body

Correspondent Would you like to suggest anything more for the prospective candidates ?

Shri V S Nothing Sir, I have told you that *I am too insignificant and unimportant* for such a task I can only wish them success and thank your journal for this flattering kindness One thing that I have constantly felt however is that competitive examinations are not the end of one s life No doubt they are quite decisive from the point of view of one's station in life but beyond that *their importance is* just nothing One must be sporting about them In the present set up of our country, one s aim should be to do his best for the betterment of our toiling and hard pressed masses For this aim success in a competitive examination is absolutely unessential. My young friends should always keep this *thing in their minds Employment* and the best possible employment one must get but the thing of great importance is that one must discharge his duties conscientiously irrespective of his station in life I have always considered those persons who are pessimistic and unnecessarily frustrated and who also have the temerity to spread their cult of frustration among the young men to be the greatest enemies of the nation To be successful in life one must learn to be hopeful daring and contented. Instead of being worried one must believe in action and productive utilisation of one s time

—o—

EDUCATIONAL BROADCASTING IN INDIA

After the establishment (in 1930) of *All India Radio as a State venture* the Calcutta Station put out its first school broadcast in November 1932

By October 1938 four important Stations of A I R (Delhi, Bombay Madras and Calcutta) started putting out regular broadcasts to schools

At present educational programmes for schools are being broadcast from 20 Stations of A.I.R Of these 13 Stations originate while seven relay programmes put out by the Zonal Stations

A Programme Exchange Unit at headquarters facilitates the exchange of worthwhile programmes put out by different stations

The number of schools with *radio receivers* has continued to rise steadily and at the end of August 1957 there were 9 124 schools equipped with listening facilities.

The general *policy of* All India Radio is based on the principle that educational broadcasts should not attempt to replace the teacher but should help to supplement his work

All educational broadcasts are planned in close consultation with Advisory Committees consisting of State educational authorities and prominent educationists including headmasters of listening schools

To enlist the interest of teachers in school broadcasts short in service courses for secondary school teachers in the installation, manipulation and maintenance of radio receiving sets and the utilisation of school broadcasts are organised by A I R Five such courses have been held so far

University Forum

MEETING OF CENTRAL ADVISORY BOARD

Proposals for setting up adult schools establishing multi purpose training institutions to train teachers for different stages of education product on of instruments for the teaching of science in Secondary schools are some of the important subjects discussed at the 25th session of the Central Advisory Board of Education held in New Delhi on February 6 and 7 1958 The Union Minis ter of Education and Scientific Research Maulana Abul Kalam Azad presided

The conference also reviewed the progress of educational develpoment plans in the Central and State sectors Progress of Techni cal Education and the work of the All India Council for Secondary Education also came up for discussion at the meeting

The Central Advisory Board of Education which meets every year to review the progress of education in the various States consists of 44 members with the Union Minister of Education & Scientific Re erch as its Chair man All the State Education Ministers Members of Parliament Representatives of Inter University Board and other specialised bodies and prominent educationists are re presented on the Board

The Board has five Standing Committees to deal with various educational problems These are Basic Education Committee Social Education Committee Secondary Education Committee, Higher Education Committee and General Purpose Committee

The Board was first constituted in 1920 under the chairmanship of the then Educa tional Commissioner with the Government of India. It was abolished in 1923 and re vived in August 1935 The Board serves as a clearing house of ideas and a reservoir of information in regard to the educational developments in the country

The main functions of the Board are (a) to advise on any educational question which may be referred to it by the Government of India or by any State Government (b) to call for information and advice regarding educational developments of special interest or value to India to exmine this information and circulate it with recommendations to the Government of India and to State Governments

*   *   *

SCHEMES FOR PHYSICAL EDUCATION

The Government of India should set up an independent Committee to co-ordinate all schemes and examine all programmes which touch upon physical education, recreation, sports and youth welfare and to evolve an integrated policy was one of the recommen dations of the Central Advisory Board of Physical Education and Racreation which concluded its one-day meeting in New Delhi, on January 31

The Central Advisory Board of Physical Education and Recreation was set up as an advisory body by the Government of India to advise them regarding the development and promotion of physical education and recreation Shri P N Kirpal Joint Secretary to the Government of India Ministry of Edu cation and Scientific Research who is Chair man of the Board presided

It was also decided to constitute an *Ad hoc* Committee to report on the facilities available in the Physical Education Institutions in different regions For the time being the Committee will visit Institutions in the Bombay region Besides considering the question of recognition of Diplomas and Certificates given by the Institutions con cerned this Committee will also make recommendations regarding the expenditure required for the development and improvement of these Institutions Any grants that may be paid by the Government will be made on the basis of this Committee s recommendations.

The Board proposed that two seminars, one for experts in the indigenous institutions like vyamshalas and another for persons work ing in recreational activities should be held in addition to the seminar of principals of Physical Education Institutions to be held in Madras in February 1958 and the Seminar of State Inspectors of Physical Education to

be held in Mahabaleswar in April 1958 As regards the question of the Fundamental Research in Physical Education and connected fields it is decided that the matter should be further examined by the forthcoming Seminar of Principals of Physical Education Institutions The Subjects in which the Research should be conducted will b discussed in this Seminar

The Board approved all the physical efficiency tests prepared by the Principal, Lakshmibai College of Physical Education, Gwalior, for the purpose of inaugurating a National Physical Efficiency Drive and decided that these should be put into operation as early as possible so that beginning could be made with Physical Efficiency Drive on a national basis

A provision of Rs 40 lakhs has been made in the Second Five Year Plan for the development of physical education and recreational activities by the Union Ministry of Education and Scientific Research

CULTURAL BASIS OF EDUCATION

Delivering the Foundation Day address at the Central Institute of Education in Delhi Prof M Mujeeb Vice Chancellor Jamia Millia Islamia referred to what he characterized as the tendency to mechanize education and deprecated it in oblique terms

He said it would not be a romantic assignment but a sober performance of its function if the Institute devoted its experience, its desire for precision its objectivity to a study of the processes of self knowlege, of revelation and self realization of the wider functions of the imagination of the creative powers of the spirit.

He felt diffident in talking about education because he did not understand its current language', He said the educational expert might soon become something like the medical expert, diagnozing prescribing observing and repeating this process till the educational objective was attained and the disastrous feature of this would be that the educational expert would not treat the diseased but only those in reasonably sound health

Prof Mujeeb meant to say that the real purpose of education was not to dole out what he called 'formal education but to develop the personality of the individual. The task of the school was to guide the community and it was not for the community to guide it.

It was not only to persons and societies in today and to current education philosophy that the Institute should look for guidance in the ordering of values. Its field was all history all philosophy, all art and all religion His references to the various so-called modern education methods were not all complimentary He was of the view that culture should be the basis of all education

GUIDE BOOKS FOR TEACHERS IN BASIC SCHOOLS

The Union Ministry of Education and Scientific Research initialed a scheme some time ago to encourage the production of suitable guide books for Basic Education Teachers These books will contain lesson notes in different subjects properly correlated in accordance with the concept and principles of Basic Education

Intending authors are requested to submit their manuscripts to the Assistant Educational Adviser (B 5) Basic and Social Education Division, Ministry of Education and Scientific Research New Delhi by August 31 1958 Additional information about the scheme could also be obtained from him

Under the Scheme the following prizes are proposed to be awarded to the best manuscript —

Grades	*First Prize*	*Second Prize*	*Other Approved books*
I & II	Rs 1 000	Rs 750/	Rs 200/ for each
III IV & V	Rs 1 250/	Rs 850/	Rs 200/ ,
VI VII & VIII	Rs 1 500/-	Rs 1 000/	Rs. 200/ ,

Each book/Mss should be accompanied by a Treasury Chalan of rupees 3/ (for an author) and Rs 5/- (for a publisher) deposited in a Treasury under the Head XXVI —Education — Miscellaneous — Literature for Basic Education. Where no Treasury exists crossed Indian postal order may be sent in the name of Assistant Educational Adviser (B 5) Basic and Social Education Division Ministry of Education and Scientific Research, New Delhi

Four copies of the printed books or four copies of the Mss neatly typed on one side of the paper should be submitted giving the following information —

(i) Grade for which the book is written
(ii) Name and address of the Author/Publisher
(iii) No and date of Treasury Chalan and amount thereof

Mss submitted will not be returned and the decision of the Government of India will be final in all cases of dispute.

SCIENCE & INVENTION

Electro-Jet Current Located

United States scientists taking part in the work of the International Geophysical Year have found for the first time the exact location of the electro-jet current. This is a stream of concentrated electricity that circles the globe at an altitude high in the earth's atmosphere.

The current is believed to be part of a world wide system of electric currents which are responsible for changes in the earth's magnetic field in the equatorial regions. Scientists consider observations of the current made near the equator to be of great importance, since they may provide definite information concerning the current's nature and cause.

The American scientists made their observations from an IGY station established on Korror Island which is east of the Philippines in the Palau group. This island was chosen because it is near the earth's magnetic equator.

Wonder Metal Produced in Pure Form

The so-called "wonder metal" niobium is now being produced in its purest form for the first time by scientists of the Westinghouse Electric Corporation at Pittsburgh, Pennsylvania. Scientists and engineers believe that niobium may be of major importance in the development of future aircraft engines and nuclear reactors.

Discovery of a method to purify niobium, formerly called columbium, is considered an important step towards its practical application in industry. It is expected that new alloys based on niobium will be able to maintain their strength at temperatures above 1,800 degrees Fahrenheit. This is well above the highest operating temperatures of the best existing engine and reactor structural materials.

The Westinghouse scientists purified the metal by repeated meltings in a nearly perfect vacuum. The high temperature and low pressure distils impurities out of the metal.

* * *

Medicine Eases Shock in Heart Attacks

A drug which prevents shock during surgery is also valuable in easing shock following heart attacks. Dr Arthur Bernstein of Newark, New Jersey reveals that the drug named Wyamine causes blood pressure to rise and reverse shock in 64 percent of a group of patients troubled with heart ailments. Its effect is to prevent low blood pressure. Produced by Wyeth Laboratories of the United States, the drug has been in use for five years to lighten shock during operation.

Radioactive Drug Used to Measure Burns

Radioactive phosphorus, a peaceful product of atomic energy, can be used to determine quickly the depth of serious skin burns. This was reported recently to the American Association of Plastic Surgeons by Dr Reed O. Dingman of the University of Michigan Medical School.

To know how to treat burns, the doctor explained, it is vitally important to know their depth. When the full skin thickness is destroyed by a third degree burn, for example, early removal of the skin and the grafting of new skin are required.

When radioactive phosphorus is injected, it is quickly absorbed by the body and can be measured around the burned area with radiation detection instruments. The amount of radiation around a third degree burn differs sharply from that found in a first or second degree burn, Dr Dingman reported.

Use of Rare Metal Indium Is Increasing

Indium, a rare metal extracted from waste products of zinc production plants, is becoming of increasing value to industry, according to the Anaconda Company in the United States.

One of the important uses of indium is in aircraft engine bearings. It increases their strength, provides high resistance to corrosion and gives them a high capacity to retain their protective oil film. Indium is also used in dental alloys, in making transistors, the tiny

be held in Mahabaleswar in April 1958 As regards the question of the Fundamental Research in Physical Education and connected fields it is decided that the matter should be further examined by the forthcoming Seminar of Principals of Physical Education Institutions The Subjects in which the Research should be conducted will be discussed in this Seminar

The Board approved all the physical efficiency tests prepared by the Principal Lakshmibai College of Physical Education Gwalior for the purpose of inaugurating a National Physical Efficiency Drive and decided that these should be put into operation as early as possible so that beginning could be made with Physical Efficiency Drive on a national basis

A provision of Rs 40 lakhs has been made in the Second Five Year Plan for the development of physical education and recreational activities by the Union Ministry of Education and Scientific Research

Bertrand Russell

Bertrand Russell—Bertrand Arthure William the third Earl Russell—was born 18 May 1872 at Trelleck Monmouthshire England and was educated at Trinity College Cambridge

In his long career he has written more than 40 books many of them dealing with philosophy or mathematics, and he won the Nobel Prize for literature in 1950 Most of his works have been widely translated In addition, he has contributed to books edited by others and has written numerous articles and essays

He has been a lecturer at many univer sities He began as special lecturer at the London School of Economics and Political Science in 1896 and in later years lectured at Trinity College Cambridge (1910 1916 and 1944 1950) Oxford (1914 and 1938) and at

Harvard, the University of Chicago the University of California at Los Angeles and the Chinese Government University of Peking (1920-1921) He served as occasional lecturer at the Sorbonne and at the universities of Uppsala, Copenhagen and Barcelona among others. He lectured in Australia by appointment from the Australian Institute of International Affairs in 1950

Among the many awards from learned societies he received were the Sylvester Medal of the Royal Society (1932) and the Morgan Medal of the London Mathematical Society He received the Nicholas Murray Butler Medal of Columbia University in 1915 He was president of the Aristotelian Society in 1911 and 1935

In 1949 he was awarded the Order of Merit

Always interested in international affairs, he took part in a number of international congresses particularly those in the fields of philosophy and mathematics and he was active in the World Conference of Scientists held in August, 1955 in London

As a mathematician and philosopher he became interested early in interpreting science for general readers One of his earliest books was his 'Essay on the Foundations of Geometry In 1903 he published Principles of Mathematics in 1919 Introduction to Mathematical Philosophy in 1923 The ABC of Atoms

Other titles of his works include The ABC of Relativity The Analysis of Matter 'The Prospects of Industrial Civilization and a History of Western Civilization

His radio and TV broadcasts on philosoph...le and scientific questions have added ...atly to the wide audience reached by his ...tings

Marshal Chen Yi

Under a big Government reshuffle, Marshal Chen Yi has been appointed to succeed Mr Chou En lai as Foreign Minister of the Chinese Peoples Republic it was announced from Radio Pekin on February 11

Marshal Chen Yi son of a wealthy land owner was educated in France where he formed a branch of the Chinese Communist Party with Mr Chou En lai He later joined the political branch of the Chinese Nationalist Army, but when the split came between the Communist and the Kuomintang during their campaign against the war lords he led a guerilla group against Chiang Kai-shek's forces

After World War II he played a big part in the communist victory over the Kuomintage

He was appointed a Deputy Premier in 1954 a post which he still retains A short round faced fat man in his mid 50s Marshal Chen Yi is an old revolutionary with a record of Communist service extending back to 1930

He made his debut on the international scene in the summer of 1955 when he accompanied Mr Chou to the Asian African Conference in Bandung as a member of China's delegation

In September 1956 Marshal Chen Yi made a foreign policy speech before the 18th Congress of the Chinese Communist Party saying that the Chinese Communists firmly believe that revolution is not for export

PARLIAMENTARY AFFAIRS

Indian Parliament Opened by the President

The Budget Session of the Parliament opened on Monday February 10 with an Address delivered in Hindi by the President Dr Rajendra Prasad The President spoke of the economic strains of the Second Plan and described how some of the essential projects had been saved by a concerted effort to secure foreign loans and deferred payment facilities He maintained that the Government had been able not only to arrest the upward trend but also to bring down prices to increase both agricultural and industrial productions and to improve Balance of Payments position He cautioned that despite these happy trends the situation called for both understanding of problems and sacrifices from our people for vigilance economies and the support of public opinion

The President stressed the urgency of attaining self sufficiency in food and stated that the Community Development and National Extension Service Blocks had made significant progress There are now 2 152 Blocks which comprise 2 76 000 villages and cover 15 crores of population The National Development Council having decided that the Block should be the unit for planning develop ment and the common agency of all development departments steps have been taken to integrate Departmental Development Budgets in the Block Budget The Block Development Officer is being placed in operational control of this Budget

The President also expressed statisfaction over the situation in the Naga Hills area which he stated had improved considerably

The President reiterated India s plea for a summit meeting and suspension of nuclear explosions He observed that while India could produce atomic weapons with the re sources and skill that we have and can develop we have no intention whatsoever of acquiring manufacturing or using such weapons or con doning their use by any State

The Lok Sabha began its debate on the President s Address on February 13 The debate in Rajya Sabha which began on Febru ary 12 ended on February 13

The motion of Thanks in the Lok Sabha was moved by Mr Jagannath Rao who said India s policy of non allignment had won the appreciation of the whole world He also commended the increase in food and industrial production and steps to push up exports Seconding the motion Mr M L. Dwivedi said that Government had done a good deal for the country s progress

* * *

Chagla Commission s Report The report of the Changla Commission was laid on the table of both Houses of Parliament on Febru ary 13 The Commission was set up to en quire into certain investments by the Life Insurance Corporation with particular refer ence to three questions one whether the pur chase of shares was in accordance with normal business principles or practice two the pro perty of the purchases and three the person or persons responsible for the purchase

Mr Justice Chagla concluded that the purchase of some of the shares had not been made in accordance with business principles and was also opposed to propriety on several grounds Among other things he stated that prima facie the transaction was with an indi vidual of doubtful reputation and was carried out with such haste as to suggest some com pelling reason some motivating force driving all the actors into precipitate action There was no crisis in the stock exchange as had been stated.

As for responsibility Mr Justice Chagla said that it was Mr Patel who was primarily concerned with the transaction and what he gave to the L.I.C. was not advice but an order or directive from Government It was a grave error of judgment on the part of Mr Kamath and Mr Vaidyanathan to have been over borne by Mr Patel but an extenuation of their conduct it had to be pointed out that they trusted the higher authority and better knowledge of Mr Patel Mr Justice Chagla held that constitutionally the Minister was responsible for the action taken by his Secretary with regard to this transaction

* * *

Arbitration on the Canal Water Question The Minister for Irrigation and Power Shri Patil said in the Lok Sabha on February 12 that India had not received any direct communication from Pakistan saying that she would agree to arbitration on the canal water question Shri Patil said the World Bank's proposal of 1954 had clearly indicated that the problem was one for negotiation and agreement But India had said that if Pakistan accepted the basis of the Bank's proposals she would be ready to set up an appropriate machinery for arbitrating disputes about the allocation of cost.

Mr Patil also said the arrangement for co-operative work between India Pakistan and the Bank had now expired but water was still being supplied to Pakistan He made it clear that India would divert the waters by 1962 when she would be in a position to do so

* * *

Bill to consolidate merchant shipping legislation A Bill to amend and consolidate the law relating to merchant shipping was introduced in Lok Sabha on February 14 by the Minister for Transport and Communications Shri Lal Bahadur Shastri This 447-clause Bill revises and consolidates all law in force in India relating to merchant shipping whether passed by the British Parliament or the Indian Legislature and makes provision for among other things registration of ships certificates of officers wreck and salvage and control of Indian ships and ships engaged in coasting trade

It repeals 28 Acts passed between 1838 and 1947 either by the Indian Legislature or the British Parliament in so far as they operate as part of the law of India

Meeting Of Baghdad Pact Ministerial Council

A meeting of the Baghdad Pact Ministerial Council began in Ankara on January 27 The session lasted four days and ended on January 30

Representatives of the member countries—Britain, Turkey Iraq Iran and Pakistan—were present Also present was a delegation from the United States headed by the Secretary of State, Mr John Foster Dulles

On the opening day, the Pakistan Prime Minister, Mr Feroz Khan Noon and the leader of the Iraqi delegation, General Nuri es Said, raised the Kashmir issue

Mr Noon also attacked "neutralist" countries and said. "Of all the threats to which the Baghdad Pact area is subjected the most invidious is from the so-called neutralists The part which they (the neutralists) are playing in supporting subversion and in providing a pseudo-moral basis for it constitutes a serious threat It is time we recognized this danger and took active steps to meet it The people of the Baghdad Pact countries are quite bewildered when they find that some of these so called neutralists are recipients of large scale aid not only from communist countries but also from Western countries whose policies they are constantly attacking

He added 'Unless differentiation can be made between friends and neutralists the distinction between friends and foes is in grave danger of being blurred There can be no objection to a nation following under certain circumstances a policy of neutrality so long as it is genuine neutrality In certain quarters however neutrality is regarded as meaning hostility to one side and friendship with the other irrespective of precepts or practice"

He expressed the hope that the efforts Dr Frank Graham the UN Representative present in the Indian sub-continent would prove faithful and a solution of the Kashmir problem would be found

Describing Kashmir as one of the issues in which Pakistan a member of the Baghdad Pact, was concerned he said "We have continued our efforts to find peaceful solution to the questions of Kashmir and the canal waters We have accepted the resolution in the Security Council in pursuance of which Dr Graham is now in the sub continent continuing his efforts to secure the demilitarization of the State of Jammu and Kashmir so that a free and impartial plebiscite can be held under UN auspices

General Nuri es Said described the Kashmir issue as an unresolved problem which is disturbing the peace and stability in the area We believe the implementation of the resolutions of the Security Council on the Kashmir question will lead to a speedy solution of the problem

Iraq believed he said that there should be no deviation from the principles of the UN Charter in settling the question of Kashmir Such a settlement should be compatible with the rights of the people of Kashmir for self determination and freedom

The US Secretary of State Mr J F Dulles assured the Baghdad Pact member States of his country's whole hearted support and said 'Reliable independence rests on two pillars—the pillar of defensive security and the pillar of faith He added USA is prepared to co-operate where desired in these two ways with any nation or group of nations, in this general area of West Asia to maintain national independence

After the inagural session the Council held closed-door meetings

While discussing the report of the Pact's Military Committee the Council approved on January 28 long term plans for the build up of a strategic system of roads ports airfields and radio tele-communication within the area of the Pact

Also on January 28 a Turkish military officer Lieut. Gen Ekrem Akalin was appointed chairman of a new Military Planning Staff under the Baghdad Pact for one year The Secretary General of the Pact, Mr Awni Khalidi agreed with a questioner at a news conference that the creation of this Staff

was 'a step' towards a unified Pact command and said that it met the Pact members security requirements for the present

Delegation sources revealed on January 28 that the Pakistan Prime Minister Mr Feroz Khan Noon had urged in the closed session earlier in the day that member countries of the Pact should be armed with missiles

These sources reported that Mr Noon had stressed the urgent necessity of equipping and training the armies of the Baghdad Pact nations with the latest weapons so that they would be in a position to meet like equipped nations if fighting broke out

He was also stated to have attacked Britain for her reported agreement to give India some aircraft and also the American decision to give a loan of $225 000 000

Besides Turkey which as a member of NATO had already been promised missiles Pakistan was the only member of the Baghdad Pact to ask for missiles Iraq and Iran were stated to be in favour of a substantial' supply of conventional weapons

The US Secretary of State Mr J F Dulles was reported to have told the closed session of the Baghdad Pact Council on January 29 that he was against the setting up of missile bases in West Asia for the present except in Turkey which is aligned to NATO

The Secretary General of the Baghdad Pact Mr Awni Khalidi told a news conference in Ankara on January 28 that the main objective of the Pact was collective security 'Collective security means that if there is an aggression against one it is an aggression against all That is my understanding

On January 29 the Council adopted the report submitted by the Economic Committee The US Secretary of State Mr J F Dulles announced a token contribution of $10 000 000 for financing the Baghdad Pact's approved communications projects

He also assured the member countries that the implementation of all approved projects would be cared for and that more aid funds would be allotted as and when considered necessary and after the planning and survey stages had been completed

The British Government was also understood to have promised more aid to the Pact region

The Baghdad Pact Ministerial Council was also understood to have approved the establishment of machinery for closer liaison with NATO and S-EATO

In a speech at the closing session on January 30 Mr Feroz Khan Noon (Pakistan) again denounced neutralism as a grave threat to the West Asian region

He characterized neutralism as the handmaid of communism engaged in carrying out its designs He was glad that the Liaison and Counter Subversion Committees had done good work in assessing the danger of communist subversion and prescribing measures against it

Sharp differences over the final form of the joint *communique* delayed the closing session of the Baghdad Pact Council on January 30 by three hours Faced with British and American opposition to any reference to the Kashmir question in the *communique* Pakistan stoutly opposed any mention of the Palestine and Cyprus problem which Iraq and Turkey wanted

The Council which devoted considerable time to a discussion of the situation in the Mediterranean region, West Asia and South Asia did not make any reference to the special problem of Kashmir Palestine and Cyprus in its final *communique*

The Prime Minister Mr Nehru told a public meeting in New Delhi on January 30 that India would stoutly oppose the stationing of nuclear weapons in Pakistan or any other country of Asia Such a move on the part of either bloc he added would be resisted by all countries of Asia except those who were clamouring for them

---

NOT TOO WELL—BUT WISELY

Moderation is the only virtue The other so-called virtues are virtuous only in so far as they are joined with moderation To be over courageous is to be foolhardy To be over thrifty is to be parsimonious To be over loving is to be doting To be too unselfish is to weary the world with the spectacle of your martyrdom To give a child a mate or a friend too much attention or too little is equally disastrous Self abnegation and self glorification are both vices To be too thoughtful is to be incapable of action and to be overactive is self defeating Moderation is what counts —*Charlton Ogburn*

Mr. Noon also attacked "neutralist countries and said ' Of all the threats to which the Baghdad Pact area is subjected the most invidious is from the so-called neutralists The part wh ch they (the neutralists) are playing in supporting subversion and in providing a pseudo-moral basis for it constitutes a serious threat It is time we recognized this danger and took active steps to meet it The people of the Baghdad Pact countries are quite bewildered when they find that some of these so called neutralists are recipients of large scale aid not only from communist countries but also from Western countries whose policies they are constantly attacking

He added Unless differentiation can be made between friends and neutralists the distinction between friends and foes is in grave danger of being blurred. There can be no objection to a nation following under certain circumstances a policy of neutrality so long as it is genuine neutrality In certain quarters however neutrality is regarded as meaning hostility to one side and friendship with the other irrespective of precepts or practice

He expressed the hope that the efforts "Dr Frank Graham the UN Representative present in the Indian sub-continent, would prove faithful and a solution of the Kashmir problem would be found

Describing Kashmir as one of the issues in which Pakistan a member of the Baghdad Pact was concerned he said ' We [illegible] continued our efforts to find peaceful solu[tions] to the questions of Kashmir and the c[anal] waters We have accepted the resolutio[ns of] the Security Council in pursuance of wh[ich] Dr Graham is now in the sub contin[ent] continuing his efforts to secure the dem[ili]tarization of the State of Jammu and Kash[mir] so that a free and impartial plebiscite ca[n be] held under UN auspices.

General Nuri es Said described the Kash[mir] issue "as an unresolved problem which [is] disturbing the peace and stability in [the] area We believe the implementation [of] the resolutions of the Security Council [on] the Kashmir question will lead to a spe[edy] solution of the problem

Iraq believed he said that there sho[uld] be no deviation from the principles of the U[N] Charter in settling the question of Kashm[ir] Such a settlement should be compatible w[ith] the rights of the people of Kashmir for se[lf-] determination and freedom

The US Secretary of State Mr J[ohn] Dulles assured the Baghdad Pact memb[er] States of his country s whole hearted supp[ort] and said Reliable independence rests [on] two pillars—the pillar of defen ive securi[ty] and the pillar of faith He added USA [is] prepared to co-operate where desired, [in] these two ways with any nation or group of n[a]tions in this general area of West Asia to ma[in]tain national independence "

After the inagural session the Council he[ld] closed-door meetings

While discussing the report of the Pact Military Committee the Council approv[ed] on January 28 long term plans for the build u[p] of a strategic system of roads ports airfiel[ds] and radio tele-communication within the ar[ea] of the Pact

Also on January 28 a Turkish milita[ry] officer Lieut. Gen Ekrem Akalin w[as] appointed chairman of a new Military Planning Staff under the Baghdad Pact for one year The Secretary General of the Pact Mr Awni Khalidi agreed with a questioner at a news conference that the creation of this Staff

was "a step" towards a unified Pact command and said that it met the Pact members security requirements for the present

Delegation sources revealed on January 28 that the Pakistan Prime Minister Mr Feroz Khan Noon had urged in the closed session earlier in the day that member countries of the Pact should be armed with missiles

These sources reported that Mr Noon had stressed the urgent necessity of equipping and training the armies of the Baghdad Pact nations with the latest weapons so that they would be in a position to meet like equipped nations if fighting broke out

He was also stated to have attacked Britain for her reported agreement to give India some aircraft and also the American decision to give a loan of $225 000 000

Besides Turkey which as a member of NATO had already been promised missiles Pakistan was the only member of the Baghdad Pact to ask for missiles Iraq and Iran were stated to be in favour of a substantial supply of conventional weapons

The US Secretary of State Mr J F Dulles was reported to have told the closed session of the Baghdad Pact Council on January 29 that he was against the setting up of missile bases in West Asia for the present except in Turkey which is aligned to NATO

The Secretary General of the Baghdad Pact Mr Awni Khalidi told a news conference in Ankara on January 28 that the main objective of the Pact was collective security 'Collective security means that if there is an aggression against one it is an aggression against all That is my understanding

On January 29 the Council adopted the report submitted by the Economic Committee The US Secretary of State Mr J F Dulles announced a token contribution of $10 000 000 for financing the Baghdad Pact s approved communications projects

He also assured the member countries that the implementation of all approved projects would be cared for and that more aid funds would be allotted as and when considered necessary and after the planning and survey stages had been completed

The British Government was also understood to have promised more aid to the Pact region

The Baghdad Pact Ministerial Council was also understood to have approved the establishment of machinery for closer liaison with NATO and S-EATO

In a speech at the closing session on January 30 Mr Feroz Khan Noon (Pakistan) again denounced neutralism as a grave threat to the West Asian region

He characterized neutralism as the hand maid of communism engaged in carrying out its designs He was glad that the Liaison and Counter Subversion Committees had done good work in assessing the danger of communist subversion and prescribing measures against it

Sharp differences over the final form of the joint *communique* delayed the closing session of the Baghdad Pact Council on January 30 by three hours Faced with British and American opposition to any reference to the Kashmir question in the *communique* Pakistan stoutly opposed any mention of the Palestine and Cyprus problem which Iraq and Turkey wanted

The Council which devoted considerable time to a discussion of the situation in the Mediterranean region West Asia and South Asia did not make any reference to the special problem of Kashmir Palestine and Cyprus in its final *communique*

The Prime Minister Mr Nehru told a public meeting in New Delhi on January 30 that India would stoutly oppose the stationing of nuclear weapons in Pakistan or any other country of Asia Such a move on the part of either bloc he added would be resisted by all countries of Asia except those who were clamouring for them

---

NOT TOO WELL—BUT WISELY

Moderation is the only virtue The other so-called virtues are virtuous only in so far as they are joined with moderation To be over courageous is to be foolhardy To be over thrifty is to be parsimonious To be over loving is to be doting To be too unselfish is to weary the world with the spectacle of your martyrdom To give a child a mate or a friend too much attention or too little is equally disastrous Self abnegation and self glorification are both vices To be too thoughtful is to be incapable of action and to be overactive is self defeating Moderation is what counts —*Charlton Ogburn*

THE MINORITY VOTE

Truth always originates in a minority of one and every custom begins as a precedent —*Will Durant*

HOME AFFAIRS

63rd Indian National Congress Session

The 63rd annual session of the Indian National Congress was held in Pragjyotishpur ten miles from Gauhati in Assam, on Januaay 18 and 19 The Steering Committee and the Subjects Committee had met earlier to transact business which was later presented to the plenary session of the Congress and approved

The Congress President Mr U N Dhebar was given a big reception on his arrival at Gauhati on January 14

Delivering his presidential address on January 18 Mr U N Dhebar told world Powers that India saw no difficulty in their separating the manufacture and use of nuclear weapons from general disarmament Nor did India, he said see any difficulty in their coming to some concrete conclusions on the *cessation of nuclear tests*

The atmosphere was being fouled by nuclear tests which would affect not only the living but also unborn generations Yet the world was told of bombers by the hundred loaded with deadly weapons circling the skies in Europe and that though oppotunities for world peace were not limited they had appeared time and again

He reviewed national events of significance of the past year re stated Congress views on Kashmir and Goa and called for an all out popular effort to fulfil the Second Five-Year Plan He perticularly urged that concerted efforts be made to increase food production Self sufficiency in food was necessary not only to curtail the drain on foreign exchange but also to arrest the development among the pedple of a psychology of dependence on others

He said The guiding star for a free nation is freedom of choice to lay down policies If we have to avert any risk of compromise with that choice the emphasis all the time should be on the mobilization and maximum utilization of our internal resources He asked ' What about our inexhaustible resources——the idle lands valued at about Rs 15 000 crores?

... Mr T Krishnamachari had said earlier that agriculture was not only the core of the Five-Year Plan but also its foundation Congressmen had to decide firmly and immediately about land reforms in India It was through land reforms that Russia and more recently, China had solved their food problems

The following are other important points he made

Kashmir We have repeated it over and over again that Kashmir is a part of India. It cannot be separated at the demand, command or dictation of any foreign Power or agency The talk of demilitarization and plebiscite is irrelevlant in the contex of continuing aggression.

Goa ' We do not think in terms of a military solution The other alternative is of course the pressure of world opinion. Whoever has faith in the ultimate victory of truth cannot forsake the faith that Goa will sooner than we realize be a part of India World opinion is getting convinced about the justice of our case

Official Language We are all agreed that there should be no imposition of any language I am confident that the replacement of English by the language or languages of the region and simultaneous development of the languages of India will initiate a process in which the people themselves will find it easier to learn Hindi than English because of the common base Such a situation has to be brought about with the cooperation of all

Mr Dhebar departed from the text of his address to thank USA for its offer of a $225/ million loan to India

Mr T T Krishnamachari had told him that India would have to import not eight but ten to eleven million tons of food grains during the next five years or so

Resolutions — The resolutions passed by the Congress related to International Affairs Goa Economic Situation Land Reforms and Official Language

On the resolution on International Affairs the Congress re affirmed the country's ...ination not to align itself with Power

blocs and made a plea for the immediate stoppage of tests of nuclear weapons and called for a halt in the armaments race

The resolution on the Economic situation took note of foreign exchange difficulties and said that the only satisfactory way to solve them was to increase production and savings so that financial and economic stability could be maintained without sacrificing legitimate goals of development Increasing production of food and cash crops was described as of key importance Cultivators should be assured that foodgrain prices would be maintained at levels that would provide resonable and adequate incentives for increased production

On the language issue it said that the official language for all India purposes would have to be Hindi but the transition to Hindi would necessarily have to be gradual In the implementation of both constitutional provisions and previous Congress resolutions in regard to language the approach has to be flexible and practical and should be by general consensus of opinion

In the resolution on Goa it deplored the continuation of foreign rule in Goa which it stated perpetuated colonialism on the soil of India

In the resolution on Education great importance was attached to the spread of education of the basic type and it was emphasized that priority should be given to the task of conversion of the existing elementary schools into basic schools

Rupee Company For Oil Exploitation In Assam

An Agreement for the formation of a Rupee Company with an authorized capital of Rs 50 crores to explore and exploit the oil resources in the Nahorkatiya Hugrijan and Moran areas of Upper Assam was signed in New Delhi on January 14 1958 by the Government of India and the Burmah and Assam Oil Companies after negotiations lasting three years

The Burmah Oil Company (of which the Assam Oil Company is a subsidiary) will hold two thirds of the shares of the new company to be called the Oil India (Private) Limited and The Government of India one-third of the shares The authorized capital of Rs 50 crores will be divided into 500 000 shares of Rs 1 000 each

The new company will take over the assets of the Assam Oil Company in the newly discovered oil areas of the Brahmaputra Valley where the boring of 36 deep wells most of them good producers of oil has already been completed

The broad feature of the Agreement are that the new Company will undertake the production of crude oil in the above mentioned areas in Assam and sell it to two refineries to be set up in the public sector by the Government of India

It will also arrange for the construction in two stages of pipe lines from the oil fields up to Barauni, in north Bihar The Burmah Oil Company will advance a sterling loan to the extent of £10 million to the new Company to meet the foreign exchange content of the cost of the first stage of construction of the pipe line to an intermediate point between the oil fields and Barauni The new company will employ Indian nationals in preference to non Indians wherever possible

The Agreement was signed by Mr K K Sahani Joint Secretary in the Ministry of Steel Mines and Fuel on behalf of the Government of India and Mr R P Smith Managing, Director of the Burmah Oil Company *on behalf of the Burmah and Assam* Oil Companies

The delivery price of crude oil that will be paid by the two refineries will be either the lowest price delivered at Calcutta at which such crude oil can be secured by the refinery from any alternative source or the cost incurred by the Company together with a reasonable commercial return whichever is less But the price will be fixed by the Company with the approval of the Government of India after examination of the costs and will be subject to review every half year

The new Company will also arrange for the construction in two stages for the operation of a pipe line or other related facilities for the transport of the crude oil up to Barauni During the first stage the pipeline or other related facilities will be laid up to an intermediate point between the oil fields and Barauni The intermediate locality will have to be approved by the Government of India and the Burmah Oil Company

During the second stage the pipe line or such other related facilities will be extended from the intermediate locality to Barauni The timing of the commencement of each of the two stages will be determined by the Government of India

****

APPOINTMENTS, VISITORS, ETC THIS MONTH

EDITORIAL

OUR EDUCATIONAL STANDARDS

Ever since India became independent there has been much talk about the decline in teaching standards in the country and much criticism has been levelled against the present system of education Politicians and educationists, officials and laymen all are unanimous in decrying the low standard of education imparted to students

To probe into the causes of a large number of failures in matriculation examination of March 1957 the All India Council of Secondary Education collected facts and figures from 18 Boards of Secondary Education and Universities A disturbing picture of the low standard of secondary school education in many States was revealed It was found that the difference in the percentage of failures as between students going through regular schooling and private candidates was not much Some of the causes attributed to the failures were stated to be inadequate time for teaching specific subjects classes being overcrowded poor quality of teaching lengthy and unrealistic heavy syllabi large number of unqualified and untrained teachers and poor salary of teachers

Other specific causes of deterioration of education standards were stated to be a mushroom growth of schools and colleges inadequate libraries equipment and furniture inadequate attention to English inadequate staff insecure service conditions and unsatisfactory school finances The Secretary of the West Bengal Board reported that while the standard of teaching was deteriorating due to poor salaries of teachers students were being increasingly attracted away from studies by cinemas and other social distractions. Neither teachers nor pupils had much faith in the existing educational system

Addressing an informal meeting of the Directors of Public Instruction and Education in New Delhi on February 3, 1958, Shri R G Saiyidain Educational Adviser to the Government of India said One particular problem which has been causing a great deal of concern is the general problem of trying to improve our standards of education Day after day from all kinds of quarters informed and ill informed, so much adverse criticism is being poured over the head of the education system and over the heads of those teachers and others who are entrusted with this work that it is becoming increasingly difficult for educationists to be able to face public opinion Almost every one who opens his lips about education comes out with a long tale of woe on all that is happening in the field of education Inspite of the great deal of money that is being poured into education, inspite of the efforts and the formulation of schemes education has not improved much at least on the qualitative side

The Sarvodaya leader Mr Jayaprakash Narayan addressing a meeting at Lady Irwin College New Delhi on March 17 1958 attacked the present educational system which he thought was responsible for producing only office assistants or persons of this description He added 'Our educational

system makes us almost worthless It gives some training to our brains but does not train our hands Even the training which it gives to our brains is useless because we have been trained only to cram things There is a sense of emptiness after education

Addressing the members of the Poona University Court on September 28 1957 Dr Rajendra Prasad President of India said I have a feeling that there is a certain amount of deterioration in universities in what I call the character building of the students The general expansion that has taken place in the field of education in recent times in India has been only horizontal There has not been an equal expansion vertically Even though we have gained in extent we have not gained in depth

Laying the corner stone of the Polytechnic of the M S University of Baroda on October 1 1957, Dr Rajindra Prasad said that the lopsided expansion of the educational system in India today was responsible for the prevailing discontent among the people in general and youngmen in particular

Presiding over the 32nd All India Education Conference in Madras on December 26 1957 Mr C D Deshmukh declared that the almost continuous deterioration in the standards of the teaching profession and consequently in the standards of education is bound to accelerate into a widening spiral unless effective ameliorative measures are taken

Evidently something is positively missing from our modern education otherwise there would not have been such severe criticism against the educational system But no one has yet defined clearly the standard to which our education should conform The views expressed by educationists on the aims and objects of education have been so diverse and contradictory that the confusion about education has become worse confounded Everyone tries to diagnose the ills of our educational system but no one comes out with effective remedies There have been some valuable suggestions from eminent educationists for reorientation of our educational system but it will take time for the authorities to give practical shape to these suggestions. The problem of educational reform needs our serious attention A country is what its people are and a people are what their education makes them

Aim Of Education

The confusion prevailing in our educational field is, to a large extent due to lack of co ordinated thought among the men at the helm of educational affairs Different persons give different views on the basic concept of education It is yet to be decided what is the purpose of education and what minimum education should be imparted to students to call them educated

On the occasion of the annual conference of the workers of Nai Talim Prime Minister Nehru in a message to the Chairman, Hindustani Talimi Sangh Sevagram said that the process of education must help to build men and women suited to the age and the task they had to perform He added 'It is the men and women in a country that make and build a nation and it is education that is supposed to build those men and women

The President of India Dr Rajendra Prasad, presiding over the convocation of the Gujerat Vidyapith at Ahmadabad on November 3 1957 advocated the acceptance by the Government of the Gandhian basic education system He said Non acceptance by the Government of the Gandhian educational system so far had contributed to the weakness es of the present educational system in the country Without the adoption of the basic education system the paradox of tremendous expansion of educational facilities on the one hand and the educated unemployment and the consequent spread of discontent on the other cannot be effectively answered

Addressing members of the Poona University Court on September 28 1957 President Dr Rajendra Prasad said, Universities should not merely create engineers and architects but should produce men of character men of integrity and men who can be depended upon to do the things they are entrusted to do

In an article in Bhoodan Acharya Vinoba Bhave expressed the view that education which must develop "independent thinking among the citizens must be completely free from regimentation and Government control He expressed dissatisfaction with the present system of education because ' it does not make for intellectual honesty and independence It has destroyed sturdy self reliance and humility

In his convocation address at Punjab University Camp College New Delhi on March 15 1958, Mr S K Patil, Union Minister for Transport and Communications, said that the ultimate aim of education was to produce young men and women who were useful to society The aim of education was to inculcate humility modesty inquisitiveness, and a sense of service in young men and women

Our leaders have set a very high ideal of education but the common concept among students is to get a degree and a good job Majority of students failing to secure a lucrative job after spending youthful years and plenty of money to get educated , blame the present educational system as defective Our educational ideals and practices need change and reform Indian youth today suffers from a sense of frustation and lack of opportunity because of the prevailing system of education

The Teacher

Much of the blame for the present decline in educational standard is laid at the doors of teachers It is true to some extent Shri K.G Saiyidain said in New Delhi on February 3 1958, at the meeting of the Directors of Public Instruction and Education My own feeling is that the main question with which we are concerned (decline in teaching standards) is the question of improving the efficiency of our teachers and although we have taken a large number of measures particularly at the level of Secondary Education to bring about this kind of improvement there is still the criticism which to some extent is justified that the average standard of our teachers is not satisfactory and so long as their standard of efficiency their standard of integrity and their understanding of educational problems cannot be improved naturally this criticism would continue to apply

Shri Saiyidain in this connection particularly referred to a recent statement of Prime Minister Nehru that the question revolves round two things money and teachers but ultimately money did not count so much as the teachers

The teachers are generally dissatisfied with the prevailing service conditions and salary scales They resort to chalk down strikes and other methods to bring their greivances and demands to the notice of higher authorities This attitude is not conducive to have good effect on the students As a result the student has not much respect and regard for the teacher and in consequence the education suffers The teacher is the intellectual and spiritual guide to the students, so it is imperative that we should first improve his financial, social educational status.

Indiscipline Among Students

Among the causes of the decline in educational standards has been mentioned the lack of discipline and character in the students There are many factors which are responsible for this but the student is mostly the victim of circumstances After Partition most of our young men have not the harmonious and peaceful home life For them the home has ceased to be one of the determining influences in shaping their life Parents have not much control over the young ones Real character can only be built up by the parents The student of today is more susceptible to the influence of the cinema and of his playmates than to the influence of his home and his school

The students are exploited by political leaders and other agitators who have their own ends to secure by using the students as their tools It is unfortunate that mature experienced individual and sections of the community set bad examples of behaviour to the students especially with reference to hooliganism and strikes The students emulate these public leaders and get the blame for misbehaviour The attention of the students is distracted away from studies by participating in political agitations and their education has to suffer

Educational Set up

Our present system of education is also the target of critism from educationists *It is a general idea that the system of education* prevalent during the British rule was unsuited to our needs After Independence we inherited the system of education from the *British* It suited their imperialist needs for turning out clerks to run the machinery of the Government The Congress Government set before the country the task of reconstructing the educational system as the foundation of a new national life but all the efforts we have made to overhaul it have not amounted to much There has been no radical change in the old British system of education except that the standard of education has fallen deplorably During British Government our universities turned out what may be termed as intellectual giants but when we attained independence and our own Government is taking increasing interest and spending lot of money in the spread of education we have been producing what may be called intellectual pigmies English has been decried as a foreign language and we have decided to put Hindi in place of English by 1965 without first making Hindi rich enough to take place of English The fallen standard in English teaching has resulted in all round deterioration

System Of Examinations

The present out moded system of examinations in the educational institutions definitely need a change A degree or a certificate is not the true test of the talents of a student A

conference of educational experts in New Delhi on April 6 1957, suggested to the Government of India a ten year programme of reform in examination system at the secondary stage of examination and recommended for this purpose the introduction of cumulative records in the schools and internal assessment of the students at the secondary level A seminar on examinations held in Bhopal in February 1956 made special recommendations in this connection (a) making available to schools reliable achievement tests for use in internal assessment (b) introduction of the cumulative record in the schools (c) weightage to be given to the results of the school assessment in the final grading of the certificate and (d) the use of short type of questions as also ths objective type of tests in the external examination

In its effort to reorientate methods of teaching as also the examination system in high and higher secondary schools in the country the Union Education Ministry decided last year to set up an examination unit under the aegis of the All India Council for Secondary Education The unit was expected to formulate test papers relating to specified units of syllabi and make other recommendations The organisation of the unit was part of the overall plan for reform of higher Secondary education but the immediate circumstances which led to the decision to set it up was the large increase in the number of failures in Matriculation and higher secondary examination The causes of these large failures were discussed at a meeting of the All India Council for Higher Secondary Education It was felt that the complaint about heavy syllabi and the means to be adopted for the proper handling of syllabi should be examined It was suggested that such changes in the examination system should be made as will result in deserving students not meeting with failure on account of faulty teaching methods or imperfections in the examination system

The present examination system mainly depends on essay tests which measure only a single ability—the temporary ability to memorise assigned material Stress should be laid on intelligence tests and the cumulative record of students in various fields of activity in assessing their merit. It is recommended that the 50 percent of the marks in the secondary examination should be given on the basis of the work done by the student throughout the year Dr K. L. Srimali told Lok Sabha on July 22 1957 that seven viz. Madras Bombay, Kerala Mysore, Madhya Pradesh Assam Uttar Pradesh and Union Territory of Delhi had agreed to introduce a number of reforms to improve the system of examinations such as the inclusion of objective types of questions in certain subjects He further said that all the State Governments were convinced of the necessity of introducing these reforms and were taking steps to do so

Some Suggestions

To improve and raise the standards of our education we lay down following few suggestions which warrant serious attention of the men at the helm of educational affairs

1 Measures should be adopted to improve the efficiency social status and general welfare of the teachers. Only trained teachers should be given Jobs and encouraged
2 Students should be kept away from taking any part in active politics or agitational activities such as hunger strikes hartals demonstrations etc The political parties should not utilize the students as pawns on the chess board of politics
3, The present system of examination should be modified Emphasis should be placed on learning rather than on memory The present method of instruction by lectures should be supplemented by small discussion classes and seminars
4 English should be made a compulsory subject in universities as this language opens the gateway to various sciences and arts
5 'General Knowledge should be added to the curriculum as an additional compulsory subject at all stages of study There should be courses specially designed for general education in each of three fields of knowledge namely humanities, social sciences and natural sciences
6 Standard and well got up text books should be prescribed for teaching The Government should not nationalise the text books but its duty should be only to select good and standard books written by eminent educationists.
7 The whole system of education should be reorientated so that the student may become a useful citizen and an asset to society rather than a degree-holding robot groping in the darkness of future

****

THE SOCIALIST PATTERN OF SOCIETY

By Dr P S LOKANATHAN

THE socialistic pattern of society which India has accepted as the goal of her economic and social order is capable of widely varying interpretations and in fact is differently interpreted by different persons The communist takes it to require at a minimum, the end of capitalism The socialist regards it as a weakened form of socialism and at that a rather slow moving process He is against the undue gradualness implicit in the concept To the capitalist on the other hand it may mean no more than a mixed enterprise economy with a private sector also functioning subject to good behaviour

These differences in interpretation and in connotation have led to considerable criticism of the concept itself as being vague and lacking in content and concreteness On the other hand to the present writer the term socialistic pattern of society has considerable merit since it avoids the excessive emphasis and concentration on the economic aspect to which most writers on the subject are prone A socialistic pattern of society is not merely an expression of the economic organisation of the country but includes basic social and political aspects also

One of the merits of the socialistic pattern then is that it looks beyond the purely economic goal Our own Constitution surely has this wider purpose in view It provides that 'The State shall strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice, social economic and political shall inform all the institutions of the national life The Constitution also directs that the State should direct its policy towards securing that the citizens have the right to an adequate means of livelihood and that the ownership and control of material resources of the community are so distributed as best to subserve the common good and that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment All these responsibilities can well be comprehended within the term under review

Basic Criterion

What are the minimum ingredients in the concept of such a pattern of society ? The Second Five Year Plan has tried to give concreteness to the phrase Essentially it means that the basic criterion for determining the lines of advance must not be private profit but social gain and the pattern of development and the structure of socio-economic relations should be so planned that they result not only in appreciable increase in income and investment but also in greater equality in incomes and wealth

The Planning Commission goes on to say that Major decisions regarding production distribution consumption and invesment and in fact all significant socio-economic relationships must be made by agencies informed by social purposes ' One ingredient therefore is definitely social purpose and social gain A second is the reduction in the inequalities in income and wealth But another essential ingredient equality of opportunity is at least as important as reduction of inequality in income and wealth

The most effective method of securing this is by broadening the basis of education and by ensuring as much vertical mobility of labour as possible Nothing is more destructive of hope and more inhibitive of effort than the feeling that the accident of birth with a poor start in life is likely to obstruct the rise of an able person

A fourth ingredient is that the State should take a definite responsibility for creating conditions under which economic activity will not bring about increased concentration of wealth or power In the West industrial development has always been associated with increased profit making and ploughing back the profits for further investment But in a country like India we cannot afford the luxury of permitting private profits to run wild and thereby aggravate economic inequalities

It is therefore essential that the public sector should play a dominant and increasing part in the economic development of India. The expansion of the public sector in my judgment is both a logical and a functional necessity Planning for all the economic and social ends which govern India s policy is a major almost indispensable factor in bringing about a socialistic pattern

While these are the minimum ingredients it would be a great mistake to think that these are exhaustive What in our country

missed, is that the social and political factors which determine the country's progress are no less important than economic factors. That is why the Government's policy of approaching this question in a pragmatic and practical way rather than in a doctrinaire manner has much to commend itself.

It is disturbing to note that the recent economic and even social measures taken by the Government have, instead of reducing inequalities only aggravated them. The rich have tended to become richer and the poor have not significantly improved their economic position. The recent report of the All India Rural Credit Survey has brought this glaringly to our attention. Such credit facilities as have been provided by the Government have gone to benefit the bigger rather than the smaller people. Similarly, the cooperative movement, to the extent to which it has been successful (which is not much) has only benefited the richer rural strata.

Even the various aids given by the Government to the different industries have not substantially improved the lot of the smaller industrialists but have only strengthened the relatively rich and powerful.

Unless special steps are taken to ensure that the poor are rescued from their heavy handicaps, their conditions will not improve.

The case of recent land reforms in many States of India further illustrates the point. Land reforms are a prime necessity not only from the economic point of view, but even from the social point of view. One main reason for the stagnation of the rural community is the complete lack of incentives on the part of the small cultivators who do not feel that the work brings them any direct benefit.

Land reforms that have been inaugurated in many States have either not been implemented effectively or have been thwarted in their operations by the weight and influence of the richer sections of the community.

It is therefore, clear that the usual emphasis made by several people in India on economic measures to bring about the socialistic society is often wrongly laid. Even the most radical measures which may be adopted will not be effective unless social relations change rapidly. Mere legislation will not do. A declaration that there will be no discrimination against persons or class by itself does not achieve the ends that are desired. So long as the caste, language regional and other barriers in their severity as these seem to do in India the attainment of equality, social or economic will be a distant goal.

The Prime Minister has often spoken in very strong terms against this centrifugal force which breaks up society. In one of his speeches in Parliament he described the petrified caste system of India as something worse than the classes of other countries, called it a curse on India, and said that we must fight to remove this menace. Regionalism and provincialism have also added to the difficulty of transforming our present society into a socialistic pattern.

The lack of what may be called a national economic integration is a bar to progress. Western societies have come to their present level because of the way in which society had become integrated. In Asia Japan is an outstanding example of an integrated society in which class and caste like barriers have weakened.

The feeling on the part of all citizens that they belong to the community as a whole is an essential prerequisite to economic progress and the socialistic pattern of society. That this feeling is not too evident in India is manifest in different ways.

Poor Substitute

Similarly on account of our different traditions and social rigidities people in India belonging to different groups develop different and conflicting loyalties as our elections have proved. Their loyalties do not always converge.

I have laid stress on the above matters because they are usually neglected in dealing with the implications of the socialistic pattern of society. In regard to this socialism comes as a poor substitute; its emphasis is on the elimination of capitalism and ownership and on State management and control of the means of production whereas under a socialist pattern the accent is on social control; replacement of capitalism is consequential.

There is no doubt that to bring about the desired result action on the economic front is basic. It is all to the good that in India there is no doctrinaire approach to the subject and there is no desire to establish full fledged socialism without regard to its implications and consequences. The conflict between the private sector and the public sector is sometimes played up too much. The biggest private sector in India is agriculture with its millions of peasant proprietors. No amount of socialist philosophy would reconcile the

countryside to any radical transformation of peasant ownership and cultivation of land

Cooperative ownership of land and joint cultivation are rightly emphasised in India, but there is no desire on the part of any one to socialise agriculture in the sense of the collectivisation that has taken place in Russia China and other communist countries The emphasis in India is not upon socialism as such but rather upon strengthening the small man be he a peasant proprietor or a small business man The efforts made in recent years to encourage small industrialists furnish evidence of the desire on the part of the Government not to be dogmatic in its approach

How gradually or how rapidly the desired pattern should be brought about depends upon a number of factors India unfortunately is not in the happy position of bringing about equality without regard to its effect on increased production It has been pointed out by Mr Gunnar Myrdal former Executive Secretary of the Economic Commission for Europe that the Western countries embarked upon their enormous social security scheme on the basis of what may be called derived welfare in other words after a great deal of wealth and productive capacity had been built up

By contrast the under developed countries are attempting to establish a welfare state before bringing about a substantial rise in output and national income We do not want to wait long but wish to raise consumption standards quickly and bring about equality of income and wealth This is by no means easy

India s tax system has been gradually becoming more progressive and during the last two years increasingly so With additional taxes like Estate Duty Capital Gains Tax Wealth Tax Expenditure Tax and high degree of progressive income and profit taxation the chances of growing inequalities are being reduced The wealth tax in particular is likely to bring about a slight reduction in the inequalities of income and wealth distribution in India In spite of the drastic taxation measures introduced in May 1957 India is certainly not overtaxed

In all advanced industrial countries taxation absorbs about 15 to 20 per cent of national income in India even with these additional taxes the level would be about 9 per cent The expansion of the public sector by preventing profits from falling into the hands of capitalists is another means of achieving this end. In addition public enterprises are themselves an instrument to bring about better condition of living for the workers Through them a vast improvement has taken place in workers housing and other amenities The State Trading Corporation also fulfils a very important role in directing profits to the public sector

An equally if not more important instrument in bringing about a socialistic pattern of society is the Government policy of increasing public expenditure on social overheads These include the provision of opportunities for education for all social insurance schemes technical and vocational education resettlement and occupational retraining While the need here has been recognised the progress achieved has been rather slow mostly because of the lack of resources on the one hand and a legitimate desire not to outrun the available resources on the other

The Second Five Year Plan does not do enough in this field If more resources become available it would seem essential that the provision for social services should be greatly increased

To bring about the change we want it is not necessary to have nationalisation of industries As long as the levers of control are in the hands of the Government as long as the Government has the necessary power to resolve the conflict that may arise, and as long as they have sufficient authority to control any unsocial tendencies in the private sector it may not be necessary to have recourse to nationalisation The Government s Industrial Policy Resolution of 1956 clearly emphasises this aspect While full freedom is taken to bringing all industries of basic and strategic importance within the purview of the public sector and while the State also assumes direct responsibility for the future development of industries over a vital area a very wide field is still left over and open to the private sector Nationalisation is not regarded as an end in itself

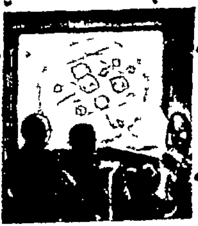
Despite the above the place of the private sector after say 25 years is a matter for speculation I am raising this question not on an ideological plane, but as a problem of fore casting trends In spite of the large and growing weight of the public sector the private sector has still a very substantial role to play in the economic activities of the country In recent years private enterprise has not lost it has gained

The private sector already seems to have fulfilled its targets under the Second Five Year Plan this notwithstanding the loud complaints of the Free Enterprise

Indeed it has shown enterprise initiative and aggressiveness It has covered its full requirements of its foreign exchange by importing ahead of schedule its needs of machinery raw materials and components from abroad It has shown a certain amount of resilience and has taken full advantage of the pragmatic economic policy of the Government Paradoxical as it may seem the expansion of the public sector has had a stimulating effect on private investment

How far the present system of mixed enterprise will survive is still a question mark It seems to the present writer that much will *depend upon the response of the private sector* to social and political challenges If in the coming years, the private sector not only delivers *its goods but does not* take advantage of scarcities to charge unfair and excessive prices does not indulge in black marketing and hoarding of stocks, and pays its taxes without evasion and fraud, there is no doubt that it can and will survive

Many promising and bright young men find service in private industry and business increasingly attractive and congenial In addition it enjoys by virtue of its inherent nature considerable initiative and resilience which has not always been the case with the public sector The public sector can never be free from rules and regulations and other restraints

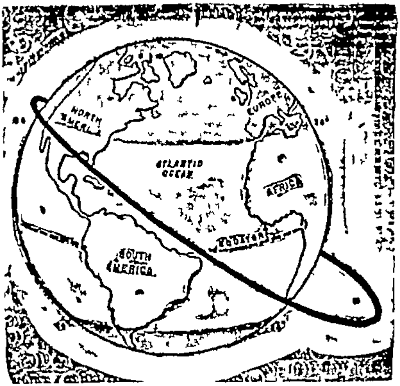


It is therefore conceivable that in terms of cost and efficiency the private sector within *its allotted field would show better results* than may be possible in the public sector As of today, there is no doubt that most of the *public enterprises* are *highly over-capitalised.* As they enjoy monopoly prices and other advantages, the public enterprises have been able to produce and make good in spite of their excessive capitalisation But if it is found that the private sector is able to do better, undoubtedly *it will* continue to play a part notwithstanding the fact that the country is wedded to a socialistic pattern of society

There is therefore much to be said for the non doctrinaire approach which the Government has adopted towards this question To judge by results rather than by philosophy to ensure that the economic activities will not accentuate tensions and problems and to promote the well being of the people by increasing public expenditure in the social fields, is a far better method of bringing about socialism than by a *blind allegiance* to a theory (From *Illustrated Weekly of India*)

DID YOU KNOW ?

Soviet secret police sometimes enter apartment buildings at night and arrest innocent persons simply to terrorize the neighbourhood



Scientists at the atomic power laboratory of the General Electric Company USA, have produced square bubbles while experimenting with lithium fluoride a clear glass-like substance Lithium fluoride is the only known material that will produce this phenomenon

The Colombians are reported to be the heaviest sugar-eaters in the world with an average annual consumption of 125 pounds per person

1958 ALPHA

(The first U S artificial earth satellite was launched at Cape Canaveral (Florida) on February 1 at 3.48 a m G M T The following graphic account describing the launching satellite its instruments and their purpose is taken from the Time Magazine of America)

Orbit Of Explorer—*Orbit of Explorer the earth satellite launched by the United States Dark line shows the variance in altitude of the satellite from apogee of about 1 600 miles to perigee of about 230 miles during typical 115.27 minute encirclement of the globe Shaded areas indicate parts of world over which the satellite does not pass*

EVEN while on its Florida launching pad the Army's satellite Explorer (official scientific name 1958 Alpha) insistently broadcast its coarse radio cry Ten minutes after take-off Antigua in the British West Indies heard it roar triumphant y overhead Fifteen minutes later it was radiotracked on Ghana on the West Coast of Africa Around the earth it swept but not until it passed homebound over California—nearly two hours after it had left the ground—were the scientists sure that the bird was in a stable orbit

The launching vehicle that put it there was a special four stage version of the Army's test rocket the Jupiter C Its first stage which contributed most of the push into space was the familiar well tested Redstone fitted for the occasion with slightly longer full tanks and burning a hydrazine based exotic fuel called hydyne which gave more thrust than its motor's usual diet of alcohol Stuck on its nose was an awkward looking cylindrical "bucket mounted on a bearing so that it could be spun and containing a cluster of 14 small solid fuel rockets 50 inches (1 016mm) long and six inches (152.4 mm) in diameter Atop the bucket was a single 80-inch (2 032 mm) solid fuel rocket with the satellite proper forming its forward part

As firing time approached, the bucket driven by a small electric motor began to rotate This motion had the same purpose as the spin of a rifle bullet to spin stabilize the upper stages of the rocket It would also check any tendency to veer off course if any of the small rockets in the bucket should ignite later than the others, or burn erratically

Bird at Peak

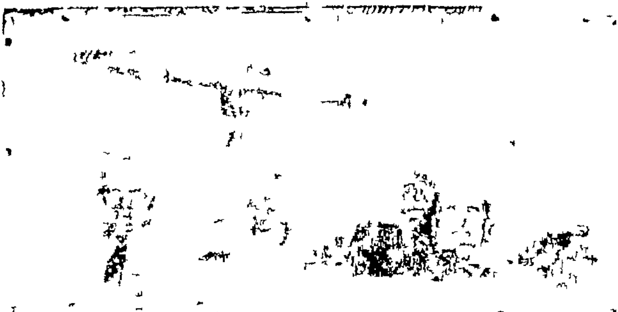
When ready for firing the whole assembly weighed 65 00 pounds so the 83 000-pound thrust of the first stage rocket motor lifted it off the ground at a fairly fast clip The first stage burned for 150 seconds When its fuel was gone about 60 miles (96 kilometers) above the earth most of the Redstone dropped away leaving only a short section of the nose attached to the spinning bucket As it zoomed upward at several thousand miles per hour a gyroscopically controlled device turned the missile's altitude toward the horizontal by blowing jets of compressed air through nozzles This process took about 240 seconds By that time the bird was at the peak of its first stage flight and pointing in the direction of its intended orbit

All the while it was being tracked from the ground in four different electronic ways

and Dr Earnest Stuhlinger, German born rocket expert was waiting for a complicated instrumental set up to tell him the exact time to ignite the second stage and "inject the satellite into its orbit When the shortened assembly reached about 12 miles (20 kilometers) altitude and was pointing in the right direction, he pressed a button

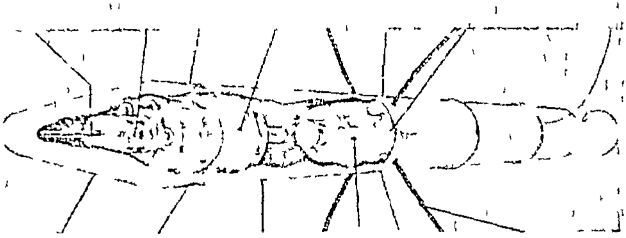
Obeying his electrical command 11 of the small rockets in the bucket fired bursting away the nose of the Redstone They burned for six seconds Two seconds after that, three more rockets fired pushing free the empty shells of the first 11 The central rocket carrying the satellite fired last It spurted ahead and alone and reached orbital velocity of more than 18,000 miles per hour (28 800 kilometers)

That was it Everything worked perfectly without the slightest hitch and the first U S satellite was in orbit



Southerly Swing

Unlike the Russian Sputniks which swept close to the Arctic and Antarctic circles the Explorer follows a sinuous orbit around the earth's middle, crossing the Equator at angle of about 34 degrees and coming as far north as Atlanta At its highest (apogee) the orbit rises to 1,700 miles (… kms) above the earth descending to … 200 miles (320 kms) (perigee) The … trip takes 114 minutes This is a … orbit above nearly all the drag of the atmosphere and higher than the orbits of Russian satellites



The Naval Research Laboratory reported on February 5 that Explorer's orbit … between 219 and 1 587 miles (332 and … kms)

None of the scientists wants to … how long the Explorer will cling to … but Maj Gen John B Medaris … of the Army Ballistic Missile Agency … it may stay up for as long as 10 years

Dr William H Pickering director of the Army's Jet Propulsion Laboratory Pasadena California, which developed the … stages of the launching vehicle says that orbit is almost exactly the intended one … only deviation is that the satellite goes a little higher than was expected

Proud Scientists—Three of the top scientists who helped develop Explorer hold aloft a duplicate of the satellite during a press conference at the U S International Geophysical Year headquarters in Washington as the official announcement is made that the launching was successful From left to right are Dr William H Pickering director of the Jet Propulsion Laboratory of the California Institute of Technology in Pasadena where the satellite was developed Dr James Van Allen, of the University of Iowa who developed much of the scientific instrumentation in the satellite and Dr Wernher von Braun director of development operations at the U S Army Ballistic Missile Agency in Huntsville, Alabama, where the Jupiter-C launching vehicle was developed.

1958 Alpha Cross Section—*This is a cut away drawing of the scientific earth satellite put into orbit by the U S Army from Cape Canaveral Florida The instrument-carrying section (forward) and the final stage rocket (rear) are orbitting as a single unit Fanning out from the mid section is the antenna made up of whip like rods with weighted balls on the ends of the rods The rotational spin of the satellite forces the antenna out*

A splendid orbit says Dr James Van Allen, of the University of Iowa who designed the instrument package for the satellite We are delighted with it He points out that the principal scientific purpose of the Explorer is to study cosmic rays at various distances from the earth and it could not do this so well if its orbit were more clearly circular

The chances are that only people with very good eyesight who live in favourable places will ever see the Explorer with the naked eye It is too small In any case says Dr Fred Whipple, head of the Smithsonian Astrophysical Observatory at Cambridge Massachusetts it will only be visible while its elliptical orbit is carrying it over the United States at low altitude When the high part of the orbit has shifted over the United States the satellite will be too faint to be seen without instruments

Those who do see it as a faint, speeding star will notice that it does not wax and wane like the conspicuous rocket that accompanied Sputnik I This is because its spin stabilization keeps it from tumbling Its direction like that of a free gyroscope is fixed in space As it rounds the earth its axis points at the same distant star

Sophisticated Instruments

The orbiting bird including the burned out rocket is 80 inches (2 032mm) long six inches (152 4mm) in diameter and weighs 30 8 pounds The satellite proper weighs 18 13 pounds of this its steel outer skin weighs 7 5 pounds and the rest nearly 11 pounds, is the pay load of instruments These weights do not compare with Sputnik I (184 pounds without its rocket) or Sputnik II (1 120 pounds with dog and rocket) but the Explorer s instruments are so light and sophisticated that they may send as much information from space as their Russian rivals

The Van Allen package of instruments assembled by the Jet Propulsion Laboratory is designed to measure three things cosmic rays micrometeorites and the temperature of the satellite itself The cosmic ray counter is a Geiger Mueller tube that gives a signal whenever 32 rays have passed through it It began performing normally as soon as the bird was launched

Micrometeorites the tiny specks of high velocity dust that infest space are detected in two ways A delicate microphone listens for vibration set up in the steel skin when it is hit by a micrometeorite The strength of the vibration is a measure of the impact The other detector on the outside of the satellite is a set of 12 grids wound with extremely fine wire When one of the wires is hit by a particle more than five microns (one five-thousandth of an inch) in diameter it will break and tell about the damage This set of instruments was designed and supplied by the Air Force Cambridge Research Center

Sensing devices (small highbrow thermometers) take the temperature of the satellite at four places as it orbits in and out of the cold

Sensing devices (small highbrow thermometers) take the temperature of the satellite at four places as it orbits in and out of the cold

INDUSTRIAL DEVELOPMENT IN 1957

THE momentum of industrial development was not only maintained during 1957 but it also acquired greater substance and speed

The general index of industrial production which stood at 133 in 1956 rose to 148 8 in the first nine months of the year

Considering that the year was one of stress and strain in view of the need to conserve the foreign exchange resources it is remarkable that there was no diminution in the output of even those industries which depend to a great extent on imported raw materials and components

Production in the major industries witnessed a further rise while the 'younger' industries like, engineering and machinery units recorded appreciable increases over the previous year The output of consumer goods also was at a higher level

New Articles

An impressive range of new articles were manufactured for the first time in 1957 To mention a few of these machine tools like milling machines hydraulic surface grinders and capstan lathes (1½ capacity), sewing machine needles, hypodermic needles diesel road rollers, automobile ancillaries like clutch and brake assemblies synthetic detergents raw materials for plastics synthetic stones etc

To overcome the difficult foreign exchange situation a system of capital goods on deferred payments was introduced This has met with a measure of success as can be seen from the fact that 85 industrial schemes involving import of plant and machinery on deferred payments were approved during the first 11 months of 1957

The value of the deffered payments arranged was Rs 42 58 crores Industries like cement sugar textiles, chemical refractories and engineering benefited by these arrangements At the same time Indian industrialists were able to secure foreign capital participation of the order of nearly Rs 8 crores

Public Sector Projects

This was in addition to the deferred payments and other credit arrangements made for projects in the public sector like the heavy machinery schemes fertilizers, coal mining etc. An agreement for utilising the Soviet credit offer of 500 million roubles for five major projects largely for heavy machinery was concluded during the year Three major contracts for the Nangal Fertilizer and Heavy Water Project were also placed during the year—all on deferred payments

Negotiations for deferred payments for other projects were nearly complete during the year and in the case of the Foundry Forge Project a definite understanding was reached Government agencies like the State Trading Corporation helped manufacturers to import their machinery requirements on deferred payment basis by entering into arrangements with exporters organizations in foreign countries.

The new Steel Plants at Rourkela and Bhilai began to take shape during the year Progress was also made on the expansion of the two big plants in the private sector The year 1958 may well see the coming into fruition of at least the early stages of this big steel expansion programme The work on the expansion of the Sindri factory reached an advanced stage

The completion of the preliminary stages of the heavy machinery project which will enable India to produce major items of steel plants and heavy chemical plants was yet another important feature of the year 1957

Higher Employment

The levels of employment offered by organized industries were higher in keeping with the higher production trends

For instance the cotton textiles industry employed 14 000 people more in 1957 than in previous year the bicycle industry employed nearly 2 000 people more the automobile industry offered employment to nearly 1,350 people more the electrical engineering industries over 3 300 the chemical industries nearly 1 000 cement nearly 500 rayon nearly 2 000, and mechanical and general engineering industries nearly 4 400

Coming to production figures (based on actual production for the first nine or ten months and estimates for the remaining period) the output of cement was 5 5 million tons, an increase of about 5 7 lakh tons over 1956

The total coal mined during the year was 42.34 million tons against 39 42 million tons

in the previous year Steel output rose to 1,342 000 tons from 1 316 000 tons in 1956

The output of cotton textiles by the mill sector is estimated at 5 327 million yards as against 5 307 million yards in the previous year The increase although slight is significant in view of the somewhat static conditions obtaining in the cloth market during the year The production of yarn was up by nearly 103 million pounds rising to 1 774 millions pounds

Among other consumer industries the increases were much higher Nearly 8 lakh complete bicycles were manufactured during the year an increase of over 1 36 lakhs The output of sewing machines was up by nearly 50 000 the total production being estimated at 1 8 lakhs Razor blade production increased from 265 million to 364 million during the year The production of automobiles increased from 32 138 to nearly 33 400

About 34 400 more radio sets were manufactured during the year raising the total output to 1 85 lakh sets The output of electric fans was up by nearly 50 per cent the total production being 5 13 lakh fans Electric lamps rose to 33 million from 29 85 million and fluorescent tubes to nearly one million from 8 81 lakhs

Among other consumer goods soap (1 15 lakh tons) cigarettes (27 000 million) paper 2 1 lakh tons) and pencils (7 6 lakh gross) showed increased outputs

More Machines

Impressive rises were recorded in the output of machine tools and machinery items The production of complete machine tools was more than doubled the total value of the output being Rs 2 2 crores during 1957 The output of jute mill machinery rose from nearly Rs 30 lakhs to over Rs 1 04 crores

The production of diesel engines rose from 12 015 to 15 400 and of power driven pumps from nearly 47,000 to 60 000 The output of electric motors was 4 5 lakh HP an increase of nearly 25 per cent over the level of the previous year The total production of power transformers was 1 2 million KVA an increase of more than 30 per cent

The output of aluminium was rated at 7 228 tons an increase of over 1 200 tons Copper and lead outputs were also higher There was a slight decline in the production of antimony due to shortage of imported ores

Among chemicals the production of soda ash caustic soda sulphuric acid super phosphates and chlorine was considerably higher There was a uniform increase in the output of ceramics glass and glassware and refractories The production of rayon yarn was significantly higher

---

(*Continued from page 273*)

Dr Homi J Bhabha—the famous Indian scientist who presided over the 1955 Atoms for Peace Conference in Geneva and who has made a vital contribution to putting his country on the atomic map—has said that by 1962, India will be in a position to generate electricity from atomic power By the end of 1958 Trombay will have two more reactors of the same type as 'Apsara and plans will be ready for a reactor capable of producing electric power on a commercial scale

By the middle of 1958 a small plant which will convert uranium salt into uranium metal will go into operation at Trombay It will produce enough uranium metal to supply the reactors now under construction As for heavy water —another essential prerequisite for an atomic power programme—India has a novel plan on hand It is hoped to obtain heavy water as a by product of the fertilizer plants to be set up in the next few years The large fertilizer plant in the Bhakra Nangal area of the Punjab (North India) is expected to produce 10 to 20 tons of heavy water annually

Mr Nehru has said that India is willing to share her experience in the atomic field with other countries of Asia and Africa Following this offer Burma and Egypt have already sent technicians to be trained at Trombay and Thailand is expected to follow suit

SMALL-SCALE INDUSTRIES

By SRI MANUBHAI SHAH

THE development of small scale industries is the responsibility of the State Governments under the Constitution This should be so because only local Governments can pay adequate attention to this intensive development in their respective areas To supplement their efforts, the Central Government have been playing an important role in the sphere since 1948 when it laid emphasis on the development of small and cottage industries under the Industrial Policy Resolution dated April 6 1948 In the early stages, the Union Government limited their efforts to provision of funds for implementation of approved schemes of State Governments and acted as a clearing house of ideas on development measures

It soon became clear however that the problem was too big and too difficult for State Governments to handle it alone, all the more so because of the shortage of technical officers available with them Therefore an international team of experts was invited in 1953 to advise the Government and following its recommendations the Central Government undertook to provide financial technical and marketing assistance through several organizations and boards in addition to helping the State Governments in the execution of the small scale industries

Government Provision

Though generally the term Small Industries would cover small industrial units occupied in the production of all types of items special agencies have been set up for the development of handlooms coir silk handicrafts khadi and village industries and the remaining industries generally run by power It is to the latter that the term Small Scale Industries is being applied now-a days This covers almost all small engineering chemical industries light and consumer industries For the development of these industries a Small-Scale Industries Board has been set up by the Central Government with 52 members including officials non official representatives and State Government representatives to advise the Government on matters of developmental c...s and to keep watch on the progress of

As we know in the Second Plan Government have given a special emphasis on the development of small industries Against a meagre provision of about Rs 25 crores on these industries in the first Plan period Government have provided Rs 200 crores for Small Industries in the second five year Plan

The provision is as under—

Small Scale Industries	Rs	61 0	Crores
Handloom	Rs	59 5	Crores
Khadi and Village Industries	Rs	55 5	Crores
Handicrafts	Rs	9 0	Crores
Silk	Rs	5 0	Crores
Coir	Rs	1 0	Crores
Others	Rs	9 0	Crores
Total	Rs	200 0	Crores

Amongst the various measures introduced for assistance of small industries the Government devoted their attention at an early stage to the necessity for providing credit on liberalized terms In consultation with the Small-Scale Industries Board the terms and conditions under which loans were advanced to small industries by State Governments were liberalized and now it is possible for small industrialists in most States to get loans up to Rs 1 000 on personal bond up to Rs 5 000 on one or more sound sureties and above that amount on 75 per cent of the security offered which includes land building plant machinery stocks and other assets created out of the loan The rate of interest payable by industrial co-operative societies is only 2 5 per cent for amounts up to Rs 2 lakhs and three per cent from other credit agencies for amounts up to rupees 50 000 The loans are repayable in easy instalments spread over 10 years and are advanced by the State Governments through their Director of Industries.

Efforts are being made to get State Financial Corporations appointed as agents of the State Governments for handling this work so that delays caused in scrutinizing applications etc by departmental agencies may be avoided and the transactions are ...

in U P, Andhra Pradesh and Bombay have already started doing this work Urban Co-operative Banks are also being organized in different areas for giving loan to the small scale industries

In addition to the State aid to small industries mentiond above all the 12 State Financial Corporations are advancing long and medium term loans to small industries from out of their own funds under their present rules and regulations They have by now sanctioned an amount of Rs 2 4 crores to 284 small industrialists The State Bank of India has also introduced an experiment of providing working capital to small industries in 36 towns on liberalized terms and conditions By the end of September 1957 they had sanctioned an amount of rupees 62 lakhs to 141 parties The Reserve Bank is also examining the possibilities of placing some of the small industries on their approved list to provide them credit through the Co-operative Banks

Another important step that Government have taken to assist small industries is to establish an Industrial Extension Service consisting of four Regional Small Industries Service Institutes at Bombay Calcutta Madras and New Delhi 14 Major and Branch institutes and 60 Extention Centres under the control of the Development Commissioner for small scale Industries These Institutes and Centres advise small units on improved technical processes and the use of modern machinery and equipment and utilization of local raw materials hold demonstrations at stationary or mobile workshops supply designs drawings and schemes instruct small industries on proper methods of business management and act as information centres on various technical matters When necessary their technical officers both Indian and foreign visit the units to give on the spot advice By the end of November, 1957 over 38 000 parties were provided technical assistance and advice and over 36 000 visits were paid by these technical officers and experts They are also preparing technical literature of use to small industrialists and so far about 75 booklets on different industries have been published.

Training Centres

In special cases training facilities are provided by the Institutes to proprietors and workers of small industrial units though the main training programme is implemented by [illegible] of Resettlement and Employment The training requirements were recently examined by the Small Scale Industries Board An active and very extensive programme will have to be taken up by both large and small units for training apprentices In all 114 Training cum Production Centres have been established so far and 118 more centres are likely to be set up during the current year The total number of persons trained so far is 1 400 and 2 000 under training

Important Industries and selected areas are being surveyed to supply small industries and prospective enterpreneurs with information on the position and prospects of different areas Reports on 16 industries and half a dozen areas have already been completed and issued

To assist small industries in marketing their goods and particularly to meet the requirements of Government Departments large factories and big commercial concerns a marketing service has been organized under the National Small Industries Corporation which is registered as a company and wholly financed by Government The Directorate-General of Supplies and Disposals has now prepared a list of items that are purchased from small industries alone and another list where preference is given to the products of small industries The purchases made from these units during 1956-57 by the D G S and D totalled to Rs 274 6 lakhs During the current year Government has already placed orders on small industries for goods valued at Rs 147 lakhs The Corporation has succeeded in getting over a dozen large factories to utilize small industrial units as ancillaries for the production of various small components and parts It has also succeeded in selling the products of small industries worth about Rs 7 lakhs through its wholesale depots and mobile vans In addition it has secured export orders from Russia Poland and New Zealand for products of the small industries worth about rupees 80 lakhs

Hire Purchase

A scheme for supplying machines to small industrial units on easy hire purchase terms has also been entrusted by Government to the Small Industries Corporation By the end of November 1957 1 049 applications for 3 810 machines costing Rs 283 lakhs had been accepted by the Corporation and 610 machines costing Rs 50 1 lakh

supplied 1 113 sewing machines to women belonging to the low income group to enable them to augment their family income

With a view to providing suitabl factory accommodation to small scale units the Government have decided to set up Industrial Estates in about 100 towns in different parts of the country Out of this 51 Estates are already being constructed and an amount of Rs 2 7 crores has been sanctioned for this purpose While the Estates at Okhla and Naini are being constructed by the National Small Industries Corporation the other 49 Estates in different towns are being constructed and managed by the State Governments Already 33 factories are working in the Industrial Estate at Rajkot, 31 factories in the Okhla Estate 29 factories in Guindy Estate at Madras and 33 factories are working in the Industrial Estates in Kerala Thirty six factories have been constructed at Cuttack and 34 factories are constructed at Allahabad Industrial Estate Over and above these Industrial Estates seven more Industrial Estates are already under completion in the country Workshop space fitted with power and water connections is available in these Industrial Estates on rent Efforts are made to provide adequate transport postal banking insurance common facilities and other services

Raw Materials

The State Governments have introduced a number of schemes for providing training to workers common facilities for such operations as cannot be independently carried out by small units and for testing quality marking etc Directors of Industries also assist units in procuring controlled raw materials and import licences for raw materials components and machines which are not available in the country The procedure for getting import licences for plant and equipment and raw material and for getting the essentiality certificates for these industries has also been simplified

It is expected that under the second Five Year Plan Government would spend Rs 61 crores on the above activities and give additional direct employment to 1 4 lakh persons Out of this amount of Rs 61 crores Rs 15 crores are to be spent on Industrial Estates and Rs 36 crores on different scheme of small scale industries and Rs 10 crores on direct Central Government schemes The entire programme aims at giving necessary support to the small industrialist to stand on his own legs and the success of these efforts would mainly depend on the initiative and endeavour of the small enterpreneur.

These and other efforts aim at providing necessary support to small industries with a view to ultimately making them stand on their own legs Much remains yet to be done. There are certain inherent weaknesses which have yet to be overcome With all the liberalization of terms and conditions for credit, a large number of units are unable to receive the benefit because they are not in a position to provide even the minimum securities that are required They often pay high prices for their raw materials and sometimes have to sell their goods at distress prices because they do not organize themselves and fear and shun joint effort Almost all of them are working with persons who have learnt a technique by experience but are not properly trained and with out of date equipment with the result that often their cost of production is high and their quality inferior The overall shortage of iron and steel in the country and the difficulties in supplying adequate quantities of proper coal and coke at all centres add to the numerous problems they have to face

In spite of all these handicaps in a number of fields like manufacture of cycles cycle parts, sewing machine parts builders hardware, beam scales cane crushers, agricultural implements hand and machine tools brass electric lampholders electrical appliances batteries automatic ancillaries textile ancillaries surgical instruments cutlery glass ampules and phials domestic utensils padlocks light electrical products, foundry products, etc. the small scale industries are very well able to stand in competition with large scale production Given sustained and intensive efforts by the small industrialists and Government and the encouragement and willing support by the consuming public, the small scale industries hold the real key to the speedy and accelerated industrialization of the country Technology and applied scientific research can spread through the length and breadth of this sub-continent of ours only through small scale industries They will be the ultimate sinews of our economic growth and development

INTERNATIONAL AID FOR PROJECTS

By SHRI K C KHATRI

Superintending Engineer, Central Water and Power Commission

MULTIPURPOSE integrated river valley planning is comparatively new to India as it is for all countries For carrying out the necessary investigations drawing up plans for projects and their execution technical personnel specially trained in each type of work are required As some of the countries in the world have gained considerably more experience in the planning and technique of execution of multipurpose projects it would be helpul to India to draw on such experience and improve the speed and economy of project development Technically advanced countries like the U S A United Kingdom Canada West Germany and others have generously offered to assist us in the development of our water and power resources and the assistance being given by them has been playing a significant role in the Plan programmes of India Foreign assistance received in the shape of technical personnel drafted to India training for our engineers abroad materials and equipments for projects research in foreign laboratories are broadly outlined in this article

U.S Assistance

Assistance from the United States of America is by far the largest foreign aid for river valley development in the country This is being channelled through an agreement signed between India and the United States on January 5, 1952 Under this Agreement two kinds of assistance is being received namely (i) assistance in the United States and (ii) assistance in India

The Government of the United States of America has undertaken to make available at the office laboratories and other installations of the United States Bureau of Reclamation the services of personnel equipment and facilities of the Bureau as may be necessary to render such scientific and technical service and advice required by the Government of India The cost of such service is to be borne by the U S Government which has set apart a sum of $ 100 000 for the purpose Under the Agreement a number of technical problems relating to Hirakud Koyna Rihand and other projects have been referred to the Bureau of Reclamation Similarly the Bureau has also supplied a number of technical publications for use by various departments in India.

Three kinds of assistance is being offered in India by the United States Goverment

(i) Services of American technicians
(ii) Training facilities for Indian engineers in the States
(iii) Supply of equipment for the various projects under execution in India

The U S Government has made available the services of 32 technical experts during the First Five Year Plan Of these 10 were attached to the Damodar Valley Corporation, two to the Hirakud Project and the rest were assigned to the Central Water and Power Commission

The United States made available training facilities for 17 engineers from India Seven of these were from C.W & P C, three each from Hirakud and DVC Projects and the rest from State Governments

The United States also made available considerable quantity of equipment such as heavy earthmoving machinery like scrappers dumpers tractors etc, and construction equipment like stone crushers concrete batching and conveying plants etc with spare parts for various river valley projects in India

Project Equipment From U S A For First Plan Projects

Project	Estimated Project cost (*in crores of rupees*)	Cost of Equipment *made* available (dollars)
Hirakud Dam	70 78	3 323,482 00
Kakrapar Weir and Canals (Bombay)	11 65	23 615 15
Mahi (Bombay)	14 00	658 840 00
Ghataprabha (Bombay)	5 45	207 643 00
Tunga Anicut (Mysore)	2.31	15 910 00
Gangapur (Bombay)	3 34	215 640 00
Saurashtra Irrigation Scheme (Bombay)	0.94	89 650 00
Chambal Projects (Madhya Pradesh)	48 03	2,266 116 00
Pathri Project (Uttar Pradesh)	2.58	19 232 00

Aid For Flood Control

The Government of the United States is also assisting the Government of India in controlling the flood menace in this country by making available services of experts and equipment to the extent of $ 202 000 The equipment includes fully-equipped motor launches rain and river gauges that can report rainfall and river flow by unattended radio and devices to measure the speed of waterflow

Rihand Dam Project

In addition to the above projects the Government of the United States has agreed to assist in the execution of the Rihand Project to the extent of $ 6 413 017 and Rs 7 crores The dollar component is intended mostly for procuring construction equipment and also a team of construction technicians to be deputed by the U S Bureau of Reclamation The rupee component is to assist in paying for general construction costs The total cost of the Rihand Project is estimated at Rs. 48 crores

Training Centres

Similarly the Government of the United States has helped in setting up two technical training centres for operation and maintenance of heavy earth moving equipment one at Kotah and the other at Nagarjunasagar dam site Most of the equipment for these training centres and service of expert operators and mechanics are being supplied by the United States Each of the centres is training 40 operators and mechanics every year

In addition two more training centres for Hot line maintenance of transmission and distribution system are being set up one at Bangalore and the other at Nangal with the assistance of the United States These are expected to start functioning shortly

Aid From Colombo Plan

The Colombo Plan is a co-operative effort and mutual assistance programme of countries comprising the Commonwealth of Nations and Japan Burma and Thailand Under this scheme Canada, Australia and U K are affording assistance to this country in the execution of projects Out of these countries Canada has given by far the biggest contribution.

Canada

In the first two years of India s First Five Plan, Canadian assistance was mainly in the shape of commodities An amount of $1 million (Canadian) was allocated for the supply of wheat and the rupee proceeds raise therefrom were allocated by agreement f expenditure on the Mayurakshi Project i West Bengal In addition the Canad Government has also assisted the project b supplying electrical equipment costing $ million (Canadian) The Mayurakshi Da has been re named the Canada Dam as a toke of appreciation of Canada s gesture

Similarly Canada also offered capital assis tance for the Umtru Hydro-electric Proje in Assam Electrical equipment costing $1 million (Canadian) has been supplied Th costruction cost of the project is being m from the rupee proceeds of the sal of ra materials offered to the cable and wire industr for which that country had made an allocatio of $ 5 million (Canadian) in 1952 53

The Government of Canada has also mad available training facilities for Indian enginee in that country Two officers from the Centr Water and Power Commission have sinc availed of these facilities

Australia

The Government of Australia authorised an amount of Rs 372 lakhs for the supply o wheat and flour for sale in India The sal proceeds of the food material have bee utilised to meet the rupee costs of the Tunga bhadra Project Similarly that Government made an allocation of Rs 160 lakhs for the supply of construction equipment for this project and power transmission line material for the Ramagundam Power Project in Andhra

The Australian Government also made available training facilities for two Indian engineers in that country

United Kingdom

Assistance from the United Kingdom has mainly been in the form of expert personnel deputed to India training facilities for Indian engineers in the U K and supply of certain types of research equipment Three experts were assigned to the Hirakud Project and two were assigned to Central Water & Power Commission under the programme

The Government of the United Kingdom made available training facilities for seven officers of the Central Water and Power Commission and supplied equipment worth about Rs 45 000 for the Hydraulic Machinery

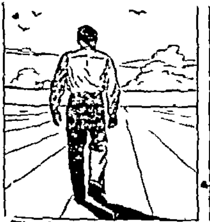
Laboratory of the Central Water & Power Research Station, Poona

United Nations

The United Nations and its specialised agencies have given technical assistance to this country The foremost among these is the UNESCO Under the terms of an agreement between India and the UNESCO two specific projects namely "Ship-Testing Techniques" and "Photo elastic Studies for determining the adequacy of designs for dam projects have been started in India The Organisation made available the services of four foreign experts, three for ship model testing and one for photo-elastic studies for these schemes Special equipment costing about Rs 1 50 000 for the ship testing tank set up at the C W & P Research Station Poona and photo-elastic equipment costing Rs 80 000 for the photo-elastic laboratory in the C W & P C at Delhi were supplied by the UNESCO

In the same programme training facilities for four officers of C W & P C. in laboratories in France Switzerland U K and Sweden etc were made available The United Nations Technical Assistance Administration a sister organisation of the UNESCO also arranged training facilities for eight officers of the C.W & P C. in various countries

West Germany



The Government of the Federal Republic of Germany have offered through West German firms training facilities to the Government of India Under this programme two officers from the Central Water and Power Commission were sent to West Germany for specialised training

International Co operation

India is thus a great beneficiary of assistance generously extended in several ways by countries which are technically and economically more forward Although it is correct to say that India's river valley projects could go on with her own resources and that the pecuniary aid received from abroad relative to the enormous investment required for them, is small, it is equally true that the imported knowledge of modern techniques is assisting project progress in India to a considerable degree The helping hand of International Co-operation contributes to the material advancement of the assisted nation strengthening it to extend in its turn similar co-operation to others in need all of which together build the great cause of world brotherhood, of which we can never have too much

—o—

DID YOU KNOW ?

The chances are you'll walk 65 000 miles in your life time or more than 2½ times the distance around the earth

The largest gold nugget ever found was the 7 560-ounce Holtermann nugget taken from Hill End New South Wales Australia in 1872 The largest silver nugget ever recorded was one of 2 750 pounds Troy found in Sonora Mexico

The Free World's plan for global disarmament would prevent war in these ways (1) Stop making atomic bombs (2) Stop testing atomic bombs (3) Prevent surprise attack by air and ground inspection (4) Reduce conventional armed forces (5) Stop the race toward outer space missiles

Intelligence Test

(Below are given some questions to test quickness of your mind and intelli gence It does not matter that you attempt all the questions What matters is the time taken by you to find the correct answers The whole paper should not take more than 30 minutes to a fairly intelligent person. Try now and find out)

—QUESTIONS—

1 If the A s have a bigger army than the B's we either ought first to fight the B s or attack the C's by sea, but not attack the A s if their army is smaller, we should attack the A s first If the C's have a bigger navy then we ought to fight either the B s or the A's but not the C's If their navy is smaller we should attack the C s first by sea

The size of the armies and navies is as follows

	Men	*Ships*
A	7 000,000	300
B	5 000 000	400
C	4 000 000	500
Ourselves	6 000 000	200

Whom should we attack first ?

2 I How will you move heavy weights from place to place without lifting them on the shoulders or through vehicles ?

II How will you draw water from a well for a sick companion if you have no ropes or bucket ?

III How will you cross a river without a boat if you cannot swim ?

IV How will you light a fire without a match stick ?

V What will you eat in a forest when your rations are finished ?

3 Detect the absurdities in the following —

(a) Once the body of a poor girl was found in a wood cut into eighteen pieces They say she killed herself

(b) A man once said If I should ever grow desperate and kill my self I shall never choose a Friday for Friday is an unlucky day and will bring me bad luck.

(c) A newspaper report said that a railway accident was not serious as only fifty persons were killed in it

(d) A man said I know a road from my house to the city which is downhill all the way to the city and downhill all the way back home.

(e) An engineer said that the more cars he had the faster he would go

(f) It is said that a certain town in Greece contains two relics of St Paul one his skull when he was a boy and the other his skull when he was a man

(g) In the year 1915 many more women got married than men

4 The following statements are correct because of one of the reasons given below each Choose the best reason

A Many people send Christmas cards to their friends because

(a) they are pretty (b) they are sent through the post for ½ d

(c) it is the custom to send good wishes to friends at Christmas time in that way (d) it provides work for postmen

B Glass is used for windows because

(a) Glass is cheap (b) you can see through glass (c) a broken window is easily replaced (d) glass is easily cut to the right size

C. A tea-cosy is sometimes placed over a tea pot because

(a) it looks pretty (b) it prevents the tea from spilling over

(c) it prevents the heat from escaping (d) it prevents the tea pot from damaging a polished table

D Farmers put manure in their land because

(a) it enriches the soil (b) they cannot sell it (c) no one will take it away (d) it kills the worms

E Motorists must have driving mirrors in their cars so that

(a) their lady passengers can use them (b) they can see the traffic behind them (c) other motorists can see them (d) their headlamps will not dazzle on coming traffic

F Policemen are useful because

(a) they protect us (b) they carry whistles (c) evil-doers should be punished (d) they are strong men

G My brother has scarlet fever but I think he will recover because

(a) he has plenty of colour in his cheeks (b) he has never had it before (c) he is being well cared for at the hospital (d) the school holidays start to-morrow

5 Three of the words in each of the groups below have something in common the other is different Which one is different ?

(i) Lovely hideous pretty beautiful
(ii) Short, tall high lofty
(iii) Face hat coat collar
(iv) London Liverpool Manchester Thames
(v) Pear potato apple, plum

6 Choose from the five words given for each gap the one that is most suitable in order to complete the paragraph

As Williams inserted the (a) in the lock of the door and (b) his house he was astonished to (c) footsteps on the stairs (d) can it be he thought When I left the house an hour ago it was (e)

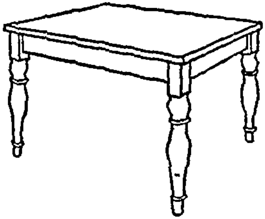
(a) handle knob key, latch catch
(b) left broke into opened entered deserted
(c) see hear touch find discover
(d) who, which what, where, why
(e) open burgled occupied, closed empty

7 Among the following 6 sentences some are witty (call them W) others are wise as well and express profound truths (call them T) others are commonplace (call them C) and others are nonsensical as they either say some thing silly or say the same thing twice (call them N) Mark each on your answer paper as W T C or N

(i) If you put a chain around the neck of a slave the other end fastens itself around your own

(ii) Show me the man hour by hour in his own home, from the rising of the sun to its going down, and I will tell you what manner of man he is

(iii) No man will be a sailor who has contrivance enough to get himself into a jail for being in a ship is being in a jail with the chance of being drowned

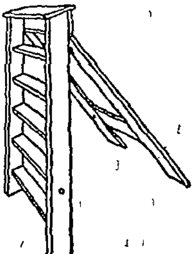


(iv) A gentleman is a man who is never rude unintentionally

(v) Our virtues are like trees they extend further and further as they grow larger

(vi) One man with truth on his side constitutes a majority

8 In all the following figures something is missing Point out the missing portion in each case



(i)

(ii)

(iii)

9 You have to give the number that comes next in each of the following lines of numbers The first three are answered for you to show what is meant

1 2 3 4 5 6 (7)

Here the number that you have to write in the brackets is 7 because the first six numbers go up by steps of one at a time

Now try the others

(i) 3 6 9 12 15 18 ( )
(ii) 2 4 6 8 10 12 ( )
(iii) 1 3 5 7 9 11 ( )
(iv) 1 2 3 4 3 2 ( )

ANSWERS

1 Attack B first

2 I It is done by means of a crow bar A crow bar is a long iron rod with a bent head. It is pushed under the heavy load and pressed The weight becomes easy to lift by means of the lever A single man can lift heavy weights

II You can use a hat as a bucket and a turban as a rope The turbans as well as hats are common in the army

III You can do it by an inflated rubber tyre or a log of wood

IV It can be done by means of flint stones as our forefathers used to do in the olden days

V Eat wild fruits and flowers

3 (a) One cannot cut himself into *eighteen pieces*
(b) When the man is dying the question of *luck does not arise*
(c) It was a serious accident.
(d) Cannot be both ways down hill.
(e) More cars cannot go faster than one car
(f) Not possible.
(g) Number of men and women will always be equal.

4 A. (c) B (b) C. (c) D (a) E. (b) F (a) G. (c)

5 (i) Hideous (ii) short- (iii) face (iv) Thames (v) potato

6 (a) key (b) entered (c) hear (d) who (e) empty

7 (i) T (ii) C (iii) N (iv) W (v) N (vi) T

8 (i) The table has only three legs. The fourth leg should have been slightly visible if the table really had four legs

(ii) The pillar box has no mouth. It has only the board giving the hour of clearance

(iii) One rung is missing.

9 (i) 21 (ii) 14 (iii) 13 (iv) 1

INDIAN STANDARDS INSTITUTION

Set up in 1947 the Indian Standards Institution has for its objects preparation, promotion and general adoption at the national and international levels of standards relating to materials commodities structures practices and operations

The ISI assists in the rationalisation of industry by co-ordinating the efforts of producers and consumers for the improvement of appliances processes, raw materials and products It promotes quality control methods, and provides for the registration of Standard Marks applicable to materials and commodities conforming to standards issued by it.

In the preparation of standards the ISI functions through a large number of Sectional Committees, Sub-committees and Panels consisting of scientists technologists and representatives drawn from industrial and Government organisations.

The fact that Indian Standards are formulated in collaboration with the largest number of interests concerned should help *ensure their widespread acceptance*

An important step taken by the ISI to aid industrialists to produce quality goods and for the consumers to recognise them is the establishment of the ISI Certification Marks Division which issues licences to manufacturers to stamp their goods with a Standard Mark certifying that the goods conform to the relevant Indian Standard

A very large *number of Indian Standards* have already been *adopted by Government departments for making their purchases*

The ISI collaborates closely with the International Organisation for Standardisation (ISO) and the International Electrotechnical Commission (IEC) two important bodies engaged in international standardisation Close liaison has also been established with National Standards Bodies of the Commonwealth

GENERAL KNOWLEDGE TEST

Test your knowledge Solve the following questions without any extraneous help When finished, look up for the answers and compare Try and see

QUESTIONS

1 (a) What qualifications make a person eligible for election as President of the Indian Republic? (b) Are Governors of States nominated or elected? By whom? What is the advantage of this procedure?

2 Write short notes on the following —

(a) Indus Canal Water Dispute
(b) Punjab Hindi Agitation
(c) University Grants Commission and the replacement of English.

3 Give the dates of the following events —

(a) Declaration of American Independence
(b) The French Revolution
(c) Outbreak of the First World War
(d) The Bolshevik Revolution in Russia
(e) The battle of Plassey
(f) Alexander's invasion of India.
(g) The birth of Gautma Buddha
(h) The Third battle of Panipat
(i) Vasco da Gama's visit to India
(j) Conquest of Everest

4 What has made the following places famous and where are they located —

(a) Sarnath
(b) Sanchi
(c) Elephanta
(d) Sindri
(e) Cherrapunji
(f) Mohenjo-Daro
(g) Bandung
(h) Bermuda
(i) Nalanda
(j) Rupkund

5 (a) Describe how you would use mercury to show that the atmosphere has weight, and how you would measure the weight

(b) Explain why and how the pitch of a train's whistle varies as the train approaches and goes away

(c) Describe how you would show the magnetic fields (i) round a horseshoe magnet and (ii) round the near ends of two bar magnets placed lengthwise (*not parallel*) with like poles facing each other but not touching

(d) Explain briefly why a lake freezes from the top instead of from the bottom

(e) Explain how a lens or reading glass is used to correct short sightedness

6 Attempt *any two* of the following —

(a) If you were given a solution of common salt in water describe how you would find the percentage of salt in the solution

(b) Describe the usual laboratory method of preparing oxygen

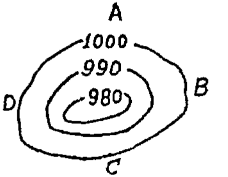
(c) Name the three main gases in the air and explain the chief use made of each by animals or plants

(d) Explain the defferences between veins and arteries

(e) Describe shortly five methods of avoiding malaria

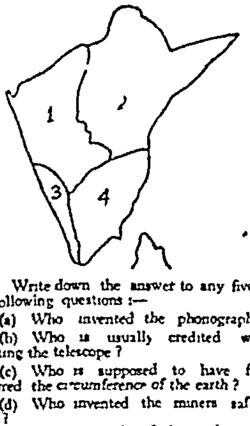
7 Where are *any four* of the following Indian Institutions?

(i) The Central Building Research Instittute
(ii) The Central Fuel Research Institute
(iii) The Central Leather Research Isntitute
(iv) The Indian Agricultural Research Institute
(v) The Indian School of Mines and Applied Geology
(vi) The National Chemical Laboratory
(vii) The National Physical Laboratory
(viii) The Tata Institute of Fundamental Research
(ix) The Bose Research Institute



8 Attempt *any three* of the following —

(a) Write down briefly in not more



then 8 lines three reasons for supposing that the earth is flat

(b) What type of pressure system is shown by the isobars in this sketch?

(c) Explain why it is generally warmer in lower latitudes than higher ones

(d) Name the States 1 to 4 in this sketch map

9 Write down the answer to any five of the following questions :—

(a) Who invented the phonograph?

(b) Who is usually credited with inventing the telescope?

(c) Who is supposed to have first measured the circumference of the earth?

(d) Who invented the miners safety lamp?

(e) Who was the Italian physician who discovered that when you touch the ends of the nerves of a dead frog with two dissimilar metals they cause muscular contraction?

(f) Who was the Italian physician who that copper and zinc in dilute sulphuric acid generate an electric current if the outer ends of the metals are connected by a wire?

(g) Who is credited with the invention of the steam engine?

ANSWERS

1 (a) No person shall be eligible for election as President unless he —

(i) is a citizen of India
(ii) has completed the age of thirty five years and
(iii) is qualified for election as a member of House of the People

(iv) A person shall not be eligible for election as President if he holds any office of profit under the Government of India or the Government of any State or under any local or other authority subject to the control of any of the said Governments

(b) The governors of States are appointed by the President of India by warrant under his hand and seal. The advantage of this procedure is that the unity of India is safeguarded and uniformity of administration is guaranteed throughout the country

2 (a) On account of the partition of the country the head works of some of the canals came to be in India while the canal irrigated parts of Pakistan. India wanted to use this water for herself and cut supplies to Pakistan She was willing to give financial help to Pakistan to build up her own irrigation system Pakistan was not prepared to accept India's proposals The matter was referred to the World Bank for mediation The issue has been hanging over fire for about ten years The present position is India maintains that Pakistan should draw the maximum supplies through the three link canals which she has already constructed. This would enable India to reduce her supplies from the three eastern rivers of the Indus basin alloted to her by the World Bank under the Bank's 1954 proposals and utilize that water for herself

Pakistan put forward the plea that it was not possible to draw the maximum supplies through her link canals as the canals have been damaged. It would take her some time to repair them. Moreover Pakistan demanded that India should pay the cost of repairs to these canals

India was not prepared to pay it unless it was part of an overall settlement of the canal waters dispute—acceptance by Pakistan of

the Bank proposals of 1954 without any conditions

India has made it known to the World Bank that while she is willing to have the mediatory efforts of the Bank until a final settlement of the ten year old dispute is reached the existing arrangements cannot continue indefinitely and that in any case she cannot wait beyond 1962

(b) The seven month-old Arya Samaj sponsored Save Hindi agitation in Punjab was suspended on December 27 1957 pending full settlement of the language dispute Earlier the Punjab Government had released some 2 000 *satyagrahis* as a gesture of goodwill to facilitate a fresh round of negotiations for an amicable settlement of the language controversy

Sarvadeshik Bhasha Swatantra Samity is willing to accept what came to be known as the compromise formula Generally speaking this formula envisaged liberalsaition of the Sachar Language Formula without altering its basic structure—and its extension to the entire State

This formula provided for instruction in Hindi in the Punjabi region (and vice versa) even if one student in a class of four in school asked for the facility The Sachar Formula provided this facility if asked for by 10 students in a class of 40 in a school

The compromise proposals, like the Sachar Formula also provided for compulsory teaching of the other language (Hindi or Punjabi) but without its sting This was sought to be done by making the other language an optinal ' non-qualifying subject for the purpose of examinations

Regarding office records it suggested that while the principle of maintaining office records in the regional language alone might be conceded it should be left to an individual to correspond with the authorities in English or the other languages (Hindi or Punjabi) till such time as the people were well versed in the regional language

(c) The University Grants Commission has accepted the main recommendations of the Report of the English Committee appointed in 1945 to examine the problem of medium of instruction at the University stage and recommend ways of securing adequate proficiency in English

The Committee mainly recommends that the change from English to an Indian language as the medium of instruction at the university stage should not be hastened and that it should be preceded by adequate preparation of the Indian language English should continue to be studied by all university students even after the change Other recommendations related to methods of teaching textbooks relation of English literature to Indian literature etc

3 (a) 1776 (b) 1789
(c) 1914 (d) 1917
(e) 1757 (f) 326 B C
(g) 563 B C (not definite)
(h) 1761 (i) 1498
(j) 29th May 1953

4 (a) *Sarnath* Near Banaras relics of Ashoka s reign
(b) *Sanchi* Madhya Pradesh Stupa
(c) *Elephanta* Near Bombay caves
(d) *Sindri* Bihar Fertilizer Factory
(e) *Cherrapunji* Assam, Highest rainfall in the world.
(f) *Mohenjo Daro* in Sindh for the ruins of the town which flourished about five thousand years ago
(g) *Bandung* In Indonesia for Asian African Conference in 1955
(h) *Bermuda* island in North Atlantic, a health resort for Americans
(i) *Nalanda* In Bihar for Budhistic University which flourished in the sixth and seventh centuries A D
(j) *Rupkund* Himalayas for the remains of pilgrims

5 (a) Take a bowl partially filled with mercury Take a glass tube closed at one end one meter in length and with a diameter of one centemeter Put a finger on the opening of the tube and invert it in the bowl of mercury Mercury in the tube will stand at about 76c The weight of atmosphere will be equal to the weight of mercury in the tube

We can calculate the volume of mercury in the tube We can determine the weight by multiplying volume by density

(b) When any arrangement producing a note of definite pitch is quickly rushed towards or away from a hearer the pitch appears to rise or fall because the wave length shortens slightly as the object approaches and lengthens as it recedes This means that an increase of frequency with higher apparent pitch occurs on approach and a decrease in frequency with an apparent lower pitch on receding

In reality the pitch of the whistle itself remains constant, it is the frequency of the waves reaching the ear that is increased or diminished

(c) Magnetic field is the area in which the influence of a magnet is felt The magnetic force is greater near the poles than away from them

If we place a piece of paper on the horse shoe magnet and sprinkle iron filings on it they will arrange themselves in a certain pattern clustering near the poles showing the comparative force of the magnet at different points

(ii) Like poles repel each other There fore, if a piece of paper is placed on two bar magnets lying with the similar poles facing each other the iron filings scattered on the piece of paper would arrange themselves so that there would hardly be any of them at the space between the two poles

(d) The water is heaviest at 4°C So at the bottom of the lake the temperature of water would hardly fall below this temperature therefore though the water at the top will freeze there will be water at the bottom at 4°c.

(e) The eye is a very delicate organ but provided with a complicated mechanism to keep it in working order However owing to age or some weakness the rays of light entering the eye converge at a point falling short of the retina or falling beyond it. The reading glass or lens is used because with its help the rays are made to converge just on the retina

6 (a) Find out the weight of the solution Then heat the solution so that the water evaporates and only salt is left behind The weight of salt can now be found Weight of the solution minus weight of salt will give us the weight of water Now we can calculate the percentage of salt dissolved in water as

Weight of the salt × 100 divided by
Weight of solution

(b) Oxygen can be prepared in the laboratory by heating potassium chlorate with manganese dioxide The gas being only slightly soluble in water can be collected by downward displacement of water in cylindrical jars

(c) Oxygen Nitrogen and Carbon-dioxide are the three main gases in the air Oxygen is useful for breathing and thus supports life Plants also need it in some degree Nitrogen is useful to animals and plants in the form of compounds Carbon dioxide is useful to plants which break it into its contituents, Carbon and Oxygen

(d) Veins are tubes through which the impure blood is pumped to the heart for purification Arteries are tubes through which pure and fresh blood is pumped to the various parts of the body

(e) Malaria can be avoided by —
(i) taking quinine in malarial season
(ii) the use of mosquito nets at night
(iii) wearing long sleeves and trousers and socks
(iv) filling up the pits in the neighbourhood so that no water collects in them and no mosquitoes are bred
(v) pouring kerosene oil over filthy water wherever it collects.

7 (i) Roorkee (ii) Dhanbad.
(iii) Madras (iv) Delhi
(v) Dhanbad (vi) Poona
(vii) Delhi (viii) Bombay
(ix) Calcutta.

8 (a) The earth is not flat because —
(i) there is no edge of the earth
(ii) If we start from one place and go straight we will reach back the place from which we had started.
(iii) We can see only the tops of distant things while if the earth were flat the whole things to the bottom should have been visible

(b) The high pressure areas surround the low pressure areas, showing the possibility of a cyclone

(c) The equatorial region of the earth faces the sun so the places North and South of it receive less of the sun consequently the lower latitudes are warmer than the higher latitudes so much so that there is perpetual snow on the poles

THE SECRETS OF ANTARCTICA

By SIR RAYMOND PRIESTLEY

Member of the Scott (1910 13) and Shackleton (1907 09) Antarctic Expeditions

TODAY the attention of the world has been attracted as never before to the Antarctic continent

Teams from a dozen nations as an essential part of that worldwide scientific effort the International Geophysical Year (IGY) are sounding the continental ice and the atmosphere above it in every way known to technological man

Perhaps the most spectacular element of this vast scientific programme—certainly the most appealing to the ordinary public—is the spanning of the Antarctic continent by Vivian Fuchs and Edmund Hillary and the echo-sounding at frequent intervals of the continental ice that covers it to a depth measured in thousands of feet This project involves a journey of well over 2 000 miles most of it at a height of several thousand feet above sea level across the greatest snow desert in the world—half of it across country never previously traversed

'Bunny Fuchs is still director of the Scientific Bureau of the Falkland Islands Dependencies Survey and his colleagues of that Survey are naturally delighted at his success—which is however no more than they expected from one who has proved his quality both as sledge traveller and leader in southern Graham Land where his sledge journeys amounted to a total distance approaching that of his present trek

Survey In 15th Year

In the meantime the Survey—for the scientific aspect of which he has been and will again in due course be chiefly responsible—goes steadily on It is now in its 15th year The Governor of the Falkland Islands on RRS *Biscoe* has been at sea on his annual summer inspection and relief of a dozen stations, the personnel of which are engaged on meteorological physical geological and biological research and on the topographical work which is providing further ground control to reinforce the aerial photography and survey carried out by Hunting Aerosurveys Ltd for the British Government in the last two years

At 11 of the 12 stations three hourly meteorological observations provide which reported to Weather Control manned by the Americans in East Antarctica help towards the building up of synoptic Antarctic weather charts

At South Georgia and Signy Island biologists study elephant and fur seals and tag their young to enable a reasonable policy of seal conservation to be worked out and the animals exploited without diminution of the herds A bird ringing programme at all the island bases helps to keep track of penguin petrel and skua population changes and provides a sound basis for a study of the habits and lives of Antarctic birds

At Port Lockroy and the Argentine islands off the Graham Land coast ionospheric geomagnetic and seismological studies contribute to the IGY programme and in South Georgia and at Admiralty Bay in the South Shetlands glaciologists make a further notable British contribution to that international plan

Vexed Question

With the onset of summer and the breakup of the sea ice the coastal sledge journeys of the winter months come to an end though the exploration of the hinterland can still proceed at the few places where there is access to the Graham Land plateau During the summer the place of sea ice travel is taken by hydrographic work from ships and motor boats in which HMS *Protector* the guardian of the Dependencies takes a prominent part

The latest addition to the scientific survey is the examination of the ancient magnetism of the basic rocks This may geologists hope, afford an answer to the vexed question whether the major land masses of the earth move about or stay out in one place and may incidentally provide a valid explanation of the presence of beds of coal several feet thick on a continent that today possesses only two species of flowering plants

A permanent laboratory of Polar travel and living is kept in being accumulating knowledge against the day—perhaps now not too far off—when the resources of the southern continent must be placed at the disposal of mankind

SCIENTIFIC DISCOVERIES OF PAST 15 YEARS

DURING few periods in world history has there been so much scientific advancement as has occurred in the last 15 years. In that time whole industries and even professions have been forced to change many of their previously considered basic concepts because of a single development or discovery.

One drug—penicillin—has saved untold numbers of critically sick or injured people in every country of the world. Splitting the tiny atom has opened a door on an entirely new world—a world that holds promise for human betterment. These and other scientific advances have literally transformed the world of the future into the world of today.

Here are a dozen scientific discoveries, any one of which could be termed phenomenal; collectively they represent what one observer in the United States has called the golden age of scientific achievement.

Polio Vaccine—The development of the polio vaccine which bears the name of its discoverer, *Dr Jonas E Salk* of the University of Pittsburg, promises virtually to wipe out one of the world's worst child cripplers. Designed to combat all three types of poliomyelitis, it was found to be 80 to 90 percent effective on 161 persons in 1953. Mass inoculations begun in the United States in 1955 now appear to have won one of the world's most decisive battles.

DDT And Insecticides—DDT was actually discovered in 1874 and then forgotten. A young Swiss chemist revived interest in it again in 1939 but the insect killer rose to fame during World War II when it was credited with stopping a typhus plague in Naples, Italy, in 1944. When the war was over DDT became a major aid to agriculture as a pesticide. It was soon joined by other insecticides like Chlordane, TEPP, Toxaphane and such weed killers as 2,4-D and Premerge. The chemical revolution in agriculture holds promise of more and better food for a hungry world.

Huge Telescope—Many astronomical puzzles have been solved and much new celestial knowledge gained since the construction of the huge Hale telescope. In use in the Palomar Mountain Observatory in California, the "Big Eye," the world's largest reflecting telescope with its 200-inch mirror, will continue for many years to unlock more of the mysteries of the firmament.

Television—Now America's leading medium of entertainment, with promise of playing a major part for the future of teaching, the visual-audio method of communication was invented in 1884 with major developments coming in the 1920's. The first telecasts began in New York in 1939 but it was not until the early 1950's that it found wide public acceptance. Television's eventual world-wide use *will do much to spread knowledge of other* people's cultures.

The Wonder Drugs—In medicine today many physicians say that 80 percent of the drugs they prescribe were unknown 15 years ago. The chemotherapeutic revolution that has taken place in that time is reputed to have saved 2.9 million lives based on the 1937 death rate. The first of the so-called wonder drugs was sulfanilamide. It has been particularly effective against pneumonia, blood poisoning, tonsillitis and childbed fever. Others of the sulfa family which derive from a group of chemicals called the sulfonamides rapidly made their appearance. The almost fabulous antibiotics, led by penicillin, have saved the lives of countless people around the world. Penicillin was discovered by Sir Alexander Fleming in Great Britain in 1928 but another 15 years were to pass before it was produced in commercial quantities. During the late 1940's streptomycin, chloromycetin, aureomycin, terramycin and others were added to the list of life-saving antibiotics.

Electronic Brains—What may prove to be the greatest scientific development of our time began in the United States in 1942 when the first so-called mechanical brain went into operation at the Massachusetts Institute of Technology. A wonder of cogs, cams, relays and miles of wire, the electronic wizard was called a *differential analyzer*. A few years later came ENIAC (electronic numerical integrator and calculator), the first calculator to use vacuum tubes and do 5,000 calculations a second.

Psychiatric Drugs—To the dark gray world of the insane the new drugs Chlorpromazine and Reserpine have brought new hope. They ease the mental burdens and lessen the need for restraints and electro-shock treatment.

Radar—Like television radar was not a brand new idea at the beginning of World War II, for as early as 1886 Henrich Hertz had demonstrated that radio waves could be bounced off solid objects. Under the pressure of war urgency however radar was developed into a precise instrument of detection. So great were its peacetime applications however that virtually all airlines and many shipping companies have installed radar on their craft. Now planes may fly blind through storms and ships safely traverse foggy areas thanks to another major scientific advance.

Fluoridation—The loss of his teeth from infection and decay has plagued man since the dawn of history. Shortly after War II scientists in the United States noticed a curious mottling of the teeth among children in certain areas. They also observed that among these children there was a very low rate of dental decay. They determined that there was a definite relation between the two conditions and that the immunity to tooth decay was caused by natural fluorides in the water. Many towns have now ordered such fluorides added to their water supplies mechanically and as other communities follow a whole new generation of children may grow up with strong teeth marred by little decay.

Plastics—Although celluloid was patented shortly before the turn of the century followed soon after by the discovery of bakelite and by the formulation of rayon in 1911 the wide spread use of synthetics and plastics in the United States really began in 1938 with the invention of nylon thread to make women's hose. During World War II and immediately after new plastic products streamed from the chemical laboratories in profusion. Today plastics and synthetics have found their way into nearly every area of human use. Nylon bearings harder than steel. Plexiglas windows that will not shatter. Vinilyte flooring that needs no waxing to maintain its sheen and Koroseal rain garments that will not crack peel or stiffen with age—all of them synthetic materials which did not exist before, are part of the endless list of products made of plastics. In the future engineers foresee complete houses made from plastics as well as such things as automobile bodies airplane fuselages and ship's hulls.

Transistors—The invention of the transistor by the Bell Telephone Laboratories in 1948 is already revolutionising the field of electronics. In most cases the tiny transistor, not much [illegible] than a pea is capable of replacing the comparatively inefficient vacuum tube. Because it neither creates nor needs heat and requires only very small voltages to operate the transistor can be used in restricted spaces and under conditions previously deemed impossible. Such fantastic applications as wrist watch radios hearing aids that are concealed in the hair and television and radio sets that can be hung on the wall like pictures are only a few of the applications held possible for the little transistors.

Atomic Energy—Unquestionably, the greatest single scientific development of the last 15 years has been the splitting of the atom and the subsequent development of atomic power. The uranium atom was first split in 1938 but it was not until 1942 that the first laboratory chain reaction was achieved at the University of Chicago. Since 1945 and the explosion of the first atomic device, scientists have been able to control the atom and harness it to serve man's peaceful purposes. Soon great ships will plough the oceans homes and industry will be lighted and powered by the atom through radioisotopes the sick are made well and almost daily medical discoveries are being made—all because men have learned to control this powerful force in Nature.

What new discoveries in science lie just ahead no one can say. But it is likely to assume that the scientific progress of recent years is not to end abruptly but rather will continue at an accelerated rate.

—o—

THINGS THEY SAY

Happiness is made up of three things a good bank account a good cook and a good digestion.

* * *

It's admirable to fight for a principle—only be sure it's a principle and not a prejudice.

* * *

We have done so much to raise our standard of living, now we need to turn out efforts to the much more important task of raising our standard FOR living.

* * *

An Englishman is a person who does things because they have been done before. An American is a person who does things because they haven't been done before.

* * *

Our days are like identical suitcases all are the same size but some people can pack more into them than others.

FILM WORLD

New Projector Solves Language Problems

A new British film projector which overcomes language problems has just been demonstrated in London With the new projector film comm ntaries can be changed into any language quickly and ch aply—a development with particular application to multilingual countries like India

By the methods in use at present for wiping off a commentary from 16 mm magnetically striped film essential sound effects are obliterated at the same time as the commentary With the new p ojector the commentary can be changed without disturbing the background sound affects.

Commentaries can be wiped off and recorded again in other languages any number of times. All the commentator has to do is to creen the film with the new projector and speak into a portable microphone attachment which enables his words and the sound effects from the permanent optical track to be recorded into the magnetic track The new projector is a product of Rank Precision Industries of London

Export of Indian Films

Exports of cinema films from India during the first eight months of 1957 fetched foreign exchange worth Rs 72 45 lakhs The to al footage exported was about 15 4 million.

Indian films are exported to over 50 countries including Ceylon Singapur Iran Indonesia Thailand Aden the U K Nepal Burma Pakistan Afghanistan the Sudan Cambodia Trinidad, Kenya the Soviet Union Czechoslovakia, France and the U S A

A number of steps have been taken by the Government to encourage the export of Indian films A film Export Advisory Committee with its headquarters at Bombay has been constituted to suggest ways and means of stimulating exports The Committee consists of representatives of the Central Government the producers and distributors of films

During January-August 1957 India imported 93 62 lakh fe t of cinema films valued at Rs 27 55 l khs

• •

Road into Interstellar Space

The new Soviet film 'Road into Interstellar Space' is a fascinating account of interplanetary communications

The first cosmic ship—a three stage manned rocket—is fired from one of the country's l unching grounds Driven by the power uni of the f rst stage it streaks into space The vehicles rudd rs automatically pl[illegible] it into the given orbit The first and the second stag s are jetti oned and the rock[illegible] begins circling the earth The crew condu[illegible] observations of the globe Then, donni[illegible] special space suits they climb out of trapdo[illegible] into the cosmos. Af er several hours t[illegible] rocket changes the direction of its flight a[illegible] gradually slowing down descends in spirals [illegible] the earth

The cinema goers also see the constructi[illegible] of the first cosmic station—a giant s ruct[illegible] consisting of interconnected fuel tanks, [illegible] central axle with auxiliary p emises and [illegible] huge outer 'ring' where the chief laborator[illegible] are housed The ring re olves so as [illegible] create centrifugally artific l gravitation [illegible] the convenience of the crew From t[illegible] station s special laboratories operated b[illegible] nuclear energy the scientists can study t[illegible] clouds th drift of ice in th Arctic Seas a[illegible] the movement of the Sun

The cosmic station i not only a gi[illegible] scientific laboratory but also a workshop where an interplanetary v h cle is assembl[illegible] for a flight to th Moon and where it [illegible] provid d with fuel The audience is thrill[illegible] by th fantastic picture of the Moon s devel[illegible] ment by the pressurized c ties going up [illegible] its surface observatories and the mining of mineral th re

The producers of this popular science film tried to show how cosm c space will be harnessed in the most truthful and scientifically prob b e way They proceeded from the latest views and theories of scient sts and engine rs working on interpl ne tary fl ghts in different countr es of the world The film deals with the fundamentals of astronautics the development of rocket techniques in Russia and abroad abo e all the w rks of the great Russian scientist Konstantin Ts[illegible]

vsky the founder of the theory of inter planetary communications Taking part in the filming was a large group of Soviet Scientists.

* * *

Science Fiction Film

Three hundred documentaries and science fiction films will be made in the USSR this year about the achieve ments of Soviet and world sciences in the development of artificial earth satellites rocketry the peaceful uses of atomic energy and other subjects

One of them Automatons in Cosmic Space will include sequences showing the globe from the height of several score kilome tres This film which is being produced by the Moscow Science Fiction Studio will deal with the use of rockets for Scientific research.

Unique shots will be included in the film Cosmic Medicine about a new branch of science studying the effect of conditions in cosmic space on living organisms

Special films will be made about the atomic icebreaker Lenin the Joint Nuclear Research Institute in Dubna near Moscow and the use of radioactive isotopes in industry geology and agriculture

* * *

International Film Festival

India walked off with two of the four top prizes at the International Film Festival held lately in San Francisco

India s documentary *Pather Panchali* was chosen as the best of 15 art films shown during the festival and these films themselves were the choice selections of each nation s producers

Satyajit Ray who directed *Pather Panchali* was named the best director

Heinz Rhymann was named best actor for his role in West Germany s *The Captain Koepenick* and an American Dolores Dorn Heft won the best actress award for her work in *Uncle Vanya*

As the Indian film was a documentary and thus had no name actors to contend for prizes the award ceremonies were in effect a clean sweep

The prizes known as Golden Gate Awards were presented by Mayor George Christopher and Harold Zellerbach president of the San Francisco Art Commission which sponsored the festival Indian Consul General Raghunath Rajkumar Sinha accepted the

The prize winners were selected by a panel of drama critics from the five major San Francisco newspapers All had been high in their praise of the Indian entry when it was shown during the festival

San Francisco Chronicle drama critic Paine Knickerbocker wrote Its appeal is universal and so imaginatively is the camera used to tell the simple story of poverty stricken family living in a tiny community in India that it was the most compelling and well liked of all the pictures shown

Actually *Pather Panchali* was a surprise entry in the festival It had been expected that *Aparajita* the Indian film which won the grand prize last summer in Venice would be the entry But *Pather Panchali* arrived in tead

Both films are a part of a trilogy directed by Satyajit Ray *Aparajita* being the second part So the selection of *Pather Pancahli* for top honours in the festival was a double triumph for Roy

* * * *

Film ' Feelies

Film feelies are almost an accomplished fact

A new screen technique which works on the principle of subconscious suggestion is being used to make a full length feature picture in Hollywood

The film the first of its kind is expected to be the biggest thing in the cinema world since the first talkie

Words of symbols are flashed on the screen too quickly for the eye to register them, but the invisible pictures are registered by the subconscious mind

Said producer Richard Rush now working on the film——a science fict on thriller "The system has a tremendous potential It adds a new dimens on to films ——a dimension of feel

UNESCO S help to build TV Station

The UNESCO will assist India in the setting up of an experimental television sta tion

Dr M.S Adiseshiah Assistant Director General of Unesco told Press reporters that the Un on Ministry of Information and Broad casting sought the help of Unesco in setting up an experimental television station in India and Unesco had now agreed to allocate 25 000 dollars to the Un on Government

(C[illegible])

In these columns we answer the queries from our readers. It may not be possible to answer each and every question but a considered reply shall be given to selected questions. Letters from our readers are welcome. These should be addressed to the **Editor, Question Box**

PROPORTIONAL REPRESENTATION

Q **Please explain the system of proportional representation**

(*K V Ittyman, Ernakulam*)

Ans The aim of proportional representation is to give every division of opinion among electors corresponding representation in national or local assemblies.

There are many variations of the system but they all have the same underlying principle. The scheme is also known as the preferential system or transferable vote system. The basis of it is that each electoral district or constituency has a minimum of three seats. No maximum is necessary. Lord Courtney suggested a fifteen membered constituency as a reasonable limit. The candidates stand on the 'general ticket'. The elector may vote for only one candidate or for a limited number and on the ballot paper he may write also 1 2 3 or more indicating his first choice, second choice and so on. To secure election the candidate need only have a certain number of votes. The number is fixed by dividing the total number of votes cast by the number of seats vacant. This (known as the 'quota') secures election as soon as a candidate reaches it. At the first count of votes only first choices are taken into account. As soon as a candidate receives a sufficient number of first choices to give him the 'quota' necessary for election he receives no more votes. The surplus votes which otherwise would have gone to him are given to the second choices. If these second choices do not bring up the necessary number of candidates to the electoral quota, then the third choices are counted and so on till all the seats are filled.

LENGTH OF ESSAY IN I.A.S.

Q **In I.A.S. competitive examination how many words—maximum and minimum—should** [illegible]

Ans Marks are awarded not for quantity but for quality. However during the time allowed a candidate can write a fairly good 2000-word essay. No maximum or minimum limit can be suggested.

INDUSTRIAL RELATIONS

Q **Should compulsory adjudication be replaced by collective bargaining in industrial relations?**

(*S L Mehta, Ahmedabad*)

Ans In a democratic country, and especially in a country like India where morality plays a great part in determining human relationship, the best course to settle a dispute is that one party should be made to take into account the point of view of the other party. The intention of the government of India, therefore, is to have industrial disputes settled in this way.

SUN SPOTS

Q **Why are there spots on the sun? Please explain in detail**

(*Suresh Chandra Shukla, Bhopal*)

Ans If a four inch picture of the sun were taken during a period of unusual sunspot frequency, the photograph would disclose several groups of spots about as if ink had been spattered on the circle representing the sun. The largest spot might be a quarter inch across. With smoked glass the largest sun spots are visible without magnification. They show the appearance and behaviour of enormous whirlpools. They produce very strong magnetic effects on the earth, disrupting telephone cable and radio services. There is a definite period between the times of greatest number. The principal cycle of sunspot disturbances is of eleven years but there may be several other shorter cycles operating within this larger one. Nothing is definitely known as to their cause. While their [illegible]

the adjacent bright areas modern ideas indicate that they may be dark because since they represent matter that has been erupted from the sun s interior and that has become so hot that their atoms are stripped of electrons

FEDERATION AND CONFEDERATION

Q Distinguish between Federation and Confederation

(Arjun B Karnani Ajmer)

Ans Though the words confederation and federation come from the same root the two are distinct in meaning Confederation both historically and logically is prior to federation but the latter is the mo e complete form of union In a federation states hitherto sovereign lose their statehood, they give up their sovereignty to another state, the federal state In a confederation union is only partial Each state preserves its original sovereignty and only for certa n common ends a new organi sation is established The confederate organ of government binds each state with the con sent of the state concerned No new state is formed though there is a new organ of government This new government is as it were the result of a treaty between inde pendent states except that the treaty has no definite duration and creates a separate orga nisation merely to recommend or carry out certain common ends Any state in a con federation can secede if it wishes The only restraint is the fear that the other states of the confederation may enforce the original treaty from the idea that they have been en dangered by the secession

In a confederation the central organ of government deals with the individual govern ments which it controls *only so far as* statutory powers permit A confederation does not deal with the citizens of the indivi dual states In a federation, however a new citizenship is created

GANDHISM

Q What is Gandhism and what are its salient features ?

(Krishna Gopal Muzaffarnagar)

Ans Mahatma Gandhi did not found any new creed He only emphasized certain features of Hinduism i e Truth and Non Violence He advocated the application of these principles to all the spheres of life includ ing politics and showed by example that it can be done.

RURAL COLLEGES

Q What are the aims and objects of rural colleges ? *(Ram Charitra Roy, Pusa)*

Ans Rural Colleges and Universities are meant to bring the educated classes nearer the villages and to spread knowledge to rural areas

WARDHA SCHEME OF EDUCATION

Q Please throw some light on the Wardha Scheme of Education *(D Soloman Asansol)*

Ans The Wardha Scheme is also known as Basic Scheme of Education or Nai Talim Its emphasis is on craft and the training of the personality of the child It was aimed at making schools self supporting, but now while the earning aspect of education is maintained, the self supporting idea has been abandoned

POWERS OF THE PRESIDENTS

Q Compare the Powers of the President of India with those of the President of U S A ***Are they both on equal footing ?***

(Atam Singh Juneja Delhi)

Ans As the chief executive officer in the United States the first duty of the President is to see that the laws of the United States are faithfully executed He is commander in chief of the army and Navy and of the militia in the service of the federal government He regulates the foreign affairs of the United States He receives foreign ministers, and, with the assent of two-thirds of the Senate, can make treaties with other powers He appoints and commissions all officers of the federal government He can also grant pardons and reprieves

The executive head of the Indian Union is also the President The executive power of the Union including the supreme command of the Defence Forces is formally vested in him and all executive actions are taken in his name

The President is vested with powers of appointment He can summon prorogue, address and send messages to the two houses of Parliament issue ordinances and give assent to legislation passed by Parliament and grant pardon suspend remit or commute sentences *in certain cases But all this work is* executed with the advice of the Prime Minister and his cabinet

Thus the U.S President and the Indian President are not on the same footing

SPORTS TERMS

Q With what sports are the *following* associated ?

(i) Davis Cup
(ii) Calcutta Cup
(iii) Ashes
(iv) Ranji Trophy

(*Manmohan Mahanty Baripada*)

Ans (i) *Davis Cup*—Lawn Tennis
(ii) *Calcutta Cup*—Horse Racing
(iii) *Ashes*—Cricket
(iv) *Ranji Trophy*—Cricket

MEDICAL BOARD

Q Can the Medical Board or U P S C over rule the decision of a civil surgeon ?

(*S Dhr Gaya*)

Ans The U P S C has published certain regulations regarding the physical fitness of the candidates But these regulations are published only for the convenience of candidates and in order to enable them to ascertain the probability of their coming up to the required physical standard and it must be clearly understood that the Government of India reserve to themselves an absolute discretion to reject as unfit any candidate whom they may consider on the report of the Medical Board to be physically disqualified and that their discretion is in no respect limited by these regulations These regulations are intended merely for the guidance of Medical Examiners and are not meant to restrict their discretion in any way

EYESIGHT FOR I P S

Q Is it compulsory that a candidate for I P S must have normal eyesight without glasses ? (*Om Prakash Verma Amritsar*)

Ans The regulations of the U P S C regarding eye sight are clear for I P S they are

Naked eye Better 6/12 worse 6/24
Corrected with glasses Better 6/6 worse 6/9
Near Vision Better 0 6 worse 0 8

Myopia should not exceed -4D and Manifest Hypermyopia should not exceed +1 5D

Any defect in colour perception will be a cause for rejection of the candidate

TERRITORIES

Q Please see your page No 206 of the present i e March 1958 issue and let me know if Andamans and Nikobars are excluded from any of the state zones illustrated vide paras 4 & 5 Though Sikkim and Bhutan also have not been incorporated but they may be considered to be loosely attached to the Indian Union The same may be cited for former French possessions in India

(*Dev Raj Aggarwal Muzaffarpur*)

Ans The Andamans and Nicobars are territories which are directly controlled by the Union Government They are not attached to any State. There has been a de facto transfer of the French possessions to India but not *de jure* transfer So they are treated on a different level. Sikkim and Bhutan are semi independent states whose relations with India are governed by certain treaties

THE RUNNER UP

Q There are three football teams A B and C By toss at first round A plays with B and is draw In second round A is winner by 1 0 goal In third round A and C play and A is winner by 2 0 goal Kindly explain who will gain the runner up cup

(*Krishna Ram Majuli Assam*)

Ans According to the rules B and C should play and winner of the two will be the *runner up*

(*Continued from page 293*)

and lend the services experts to run the station

Since the setting up of this station would require a lot of foreign equipment, the Information and Broadcasting Ministry had requested the UNESCO to make arrangements for getting the equipment on suitable terms and the UNESCO has favourably reacted to this request The project for the setting up of an experimental television station in India had to be shelved sometime ago because of foreign exchange difficulties Dr Adiseshiah also disclosed that 20 000 dollars had been earmarked for 1959 for the production of art films Similarly 1 50 000 dollars had been earmarked for the production of a film designed to promote understanding between the East and West Provision had also been made for the production of cultural films

The UNESCO will assist in the establishment of the Asian Theatre Institute in India for the development of the national theatre The assistance would be in the form of equipment fellowships and experts Provision will be made for giving training to persons belonging to this region

Dr Adiseshiah revealed that he had discussed with the Ministry of Information and Broadcasting the project for setting up a film Institute for imparting training to film technicians The project was still under discussion.

THE ROLE OF SCIENCE IN EDUCATION

By BERTRAND RUSSELL

The Kalinga Prize for the popularization of science offered annually by Unesco has been awarded for 1957 to Bertrand Russell British philosopher scientist and writer

The award was established in 1952 by Mr B Patnaik of the State of Orissa in India for the dual purpose of recognizing the importance of popular interpretation of science to the general public and of strengthening links between India and scientists of all nations

Bertrand Russell became interested early in interpreting science for the general reader In his long career he has written more than 40 books many of them dealing with mathematics or philosophy, which have been widely translated He won the Nobel Prize for literature in 1950 His radio and TV broadcasts on philosophic and scientific questions have added greatly to the wide audience reached by his writings

We publish below part of the address delivered by Bertrand Russell on receiving the Kalinga Prize from Dr Luther H Evans, Director General of Unesco, at a ceremony in Paris on January 28

"THERE was a time scientists looked askance at attempts to make their work widely intelligible But in the world of the present day such an attitude is no longer possible The discoveries of modern science have put into the hands of Governments unprecedented powers both for good and for evil Unless the statesmen who wield those powers have at least an elementary understanding of their nature, it is scarcely likely that they will use them wisely And in democratic countries, it is not only statesmen but the general public to whom some degree of scientific understading is necessary To ensure wide diffusion of such understanding is by no means easy Those who can act effectively as liaison officers between technical scientists and the public perform a work which is necessary, not only for human welfare but even for bare survival of the human race I think that a great deal more ought to be done in this direction in the education of those who do not intend to become scientific specialists The Kalinga Prize is doing a great public service in encouraging those who attempt this difficult task

In my own country and to a lesser degree in other countries of the West culture is viewed mainly by an unfortunate impoverishment of the Renaissance tradition as something concerned primarily with literature history and art A man is not considered uneducated if he knows nothing of the contributions of Galileo Descartes and their successors I am convinced that all higher education should involve a course in the history of science from the seventeenth century to the present day and a survey of modern scientific knowledge in so far as this can be conveyed without technicalities While such knowledge remains confined to specialists it is scarcely possible nowadays for nations to conduct their affairs with wisdom

There are two very different ways of estimating any human achievement you may estimate it by what you consider its intrinsic excellence or you may estimate it by its causal efficiency in transforming human life and human institutions I am not suggesting that one of these ways of estimating is preferable to the other I am only concerned to point out that they give very different scales of importance If Homer and Aeschylus had not existed if Dante and Shakespeare had not written a line if Bach and Beethoven had been silent the daily life of most people in the present day would have been much what it is But if Pythagoras and Galileo and James Watt had not existed the daily life, not only of Western Europeans and Americans but of Indian Russian and Chinese peasants would be profoundly different from what it is And these profound changes are still only beginning They must affect the future even more than they have already affected the present At present scientific technique advances like an army of tanks that have lost their drivers blindly ruthlessly without goal or purpose This is largely

(Continued on page 300)

SOME ASPECTS OF INDIAN DIPLOMACY

By A APPADORAI

THIS article is not an attempt to assess the results of India's diplomatic efforts to achieve the ends of her foreign policy—indeed it is difficult to assess such results at any rate in the short run as the success or failure of any one country in achieving the ends of policy is linked up with the efforts of several other countries working in the same or even contrary, direction—but an attempt at examining the limitations and value of the diplomatic technique on which India has laid stress during the last ten years

Diplomacy is as our authorities have it the application of intelligence and tact to the conduct of official relations between the Governments of independent States it covers the process of making and implementing foreign policy including in the term process the agencies engaged and the techniques employed in making and implementing policy. We are here not concerned with the merits of the policy itself though it will be useful in order to make the diplomatic techniques intelligible to recall the broad aims of that policy which India has been seeking to achieve

Those aims, first stated by Mr Nehru on September 26 1946 have basically remained the aims of our policy ever since the promotion of international peace and security, friendliness with all nations more particularly with neighbouring countries in Asia co-operation with the United Nations, freedom for dependent peoples and opposition to racial discrimination One should add what was unnecessary for Mr Nehru specifically to mention in the context that the promotion of the legitimate interests of India more particularly the security of India and the enlistment of international co-operation in India's economic development has been naturally an important objective of India's foreign policy Since 1946 there has clearly been an emphasis on the positive aspects of our foreign policy i e India should take every opportunity to promote by diplomatic efforts the objective of reducing International tension and enlarging the area of peace and welcoming opportunities, as in Korea and Indo-China when all the parties involved in a dispute invite her to do so to place her services at their disposal for the promotion of harmony peace and co-existence

There are three main techniques on which it seems to me India has been relying to achieve her aims negotiation, appeal to world public opinion and personal contacts with Heads of Governments and Foreign Ministers

Let it be emphasized that reliance on negotiation is by no means India's monopoly every nation resorts to negotiation to get disputes settled or to get solutions to international problems satisfactory from the point of view of its own interests In a cold war atmosphere, however in which many nations are so to say tied together by military alliances a non aligned nation like India is in advantageous position through its friendly contacts with both parties to explore more fully than others the possibilities of negotiation the advantage here is not necessarily that the right or ideal solutions are always found but you help to establish an attitude and approach that makes such solutions possible And in such negotiation, the essence of India's approach has been that if it must lead to stable results, an attempt must be made to see that neither of the parties engaged in the conflict suffers a significant loss

That if one may add was Gandhiji's technique in trying to solve disputes at Champaran in Bihar attempting to redress the grievances of peasants working in indigo plantations in 1917 he said that neither the planters nor the cultivators should suffer in any solution that was reached and that came true Gandhiji's technique is in fact a modern application of the principle of negotiation stated in the Mahabharatha. When Sri Krishna was about to proceed for negotiations to bring about a settlement between the Pandavas and the Kauravas he summarized the object of his mission thus Yes I will go to King Dhritarashtra desirous of accomplishing what is consistent with righteousness what may be beneficial to us and what is also for the good of the Kurus Principles in politics as has been well said are not like points in geometry without dimensions they must help to reconcile differences It is no derogation of such principles if the principal divergent points of view can honestly be reconciled within them

This approach to negotiation is illustrated by India's repeated efforts to have Peking admitted to the United Nations her unwil

lingness to vote on the resolution naming China an aggressor her warning to the Western Powers to desist from crossing the 38th Parallel and her efforts to achieve a negotiated settlement on Korea, Indo-China and Suez

The stress on negotiation is clearly a valuable asset in India's diplomatic techniques but it is equally important to know its limitations Korea Vietnam, Palestine Formosa, Kashmir and Goa remind us that negotiation is not a master key that opens every door the political climate in wihch the negotiations take place and the support wihch the parties to the dispute receive or expect to receive from richer and stronger countries are very important for the success of the negotiations Vietnam is a classic illustration It is on record that India's efforts to prevent a world war from breaking out in Indo-China in 1953-54 were successful only because her views on the subject were shared by Britain and Britain could substantially influence the policy of the United States it is also on record that the stalemate in Vietnam today is there largely because India together with other nations concerned did not either fully realize the political implications of the fact that the Geneva Agreement had never been recognised nor signed by South Vietnam any more than by the United States itself or having realized them, found themselves unable to alter that fact in either case it should be obvious that the Saigon Government supported substantially by the United States would naturally be unwilling to help a political settlement so long as two basic facts are there (1) the Viet Minh has jurisdiction over a larger population than the Saigon Government and (2) there is a feeling that Dr Ho Chih Minh has partial support in South Vietnam also The story of Vietnam since 1954 is striking testimony to the validity of thesis that peaceful settlement of disputes in any part of the world must in the main await the ending of the cold war between the peaceful States whose actions seem to determine the nature of peace of the world

There is another basic limitation to the potentialities of negotiation as illustrated by these instances obviously its success depends upon the goodwill of the parties concerned and their willingness to give up what they consider are their vital interests but if the goodwill is not adequate to achieve a compromise either resort is had to the use of force (which for the time being ends the negotiation) or the *Status quo* continues And neither from the social point of view, is desirable force because in a nuclear age even a limited war with the potentiality of developing into a world war with all the destruction implied in it is risky the continuance of the *status quo* because in a changing society by definition the *status quo* must necessarily fall short of justice

What then is the way out? When confronted with this basic issue Mr Nehru, speaking in Parliament on February 25 1955, could only say The only way to avoid conflicts is first of all to accept things more or less as they are I do not say *completely* because many things require change But broadly speaking you must not think of changing them by war because war does not do what you want to do but it does something much worse something quite different How far the answer is satisfying depends on how far the parties concerned consider the *status quo* tolerable and whether they feel they can successfully wage a limited war without its leading to a total war and so on but it is also clear that no better answer seems possible at the present stage of social research

The power of a nation—the ability to bring about a change in the policy and conduct of another nation—depends on a number of factors such as armaments internal political stability and economic strength national character alliances and ideas the prevailing view supported by history has been that only the voice of nations having armaments and economic strength would count in changing the policy of other nations India clearly relies almost entirely on the power of ideas to influence the policy of countries in the desired direction—mainly through the Prime Minister's speeches statements and appeals and through the speeches of accredited representatives in the U N

Is that reliance adequate the *critic asks*, because military and economic power held in reserve has through history been the main influence in international relations and how can ideas without physical force to back them, have appreciable effect?

There is considerable force in this criticism a non military approach has limits to its effectiveness All religions in the world have through ages appealed to the innate goodness of man to ensure good neighbourly conduct—honesty charity kindness social behaviour and the like and yet *how* many men still fall short of the ideal? And if individuals have not yet been *converted*, how

much more difficult it is to convert nations more marked by sentiments and prejudices than individuals? Having admitted this, I feel that the influence of ideas has perhaps been greater than most people think though it may be felt only in the long run witness the influence of the idea of the freedom of the human person (propagated by the Abolition Committee from 1787) equality (the French and American revolutions) classless society (Marxism) and of national independence as a reaction against colonialism (in Asia and Africa)

Modern developed means of communication help to appeal to world opinion directly in a manner which could not be thought of in the days of the old diplomacy- let the public of the world be convinced of the justice of a cause India correctly feels, and in democratic States at any rate their informed opinion will have some and sometimes appreciable, effect on the policies of their Governments Even in Britain which attempted a military solution in Egypt there was an enlightened minority which was against the policy adopted by the Government of the day —a helpful factor in the changing of policy adopted by the Government later when they bowed to the public opinion of the world as expressed in the United Nations (which itself was influenced by the courageous policy of the United States).

Diplomatic theory especially as expounded by one of the masters of the art—Nicolson—holds that the tendency of democratic countries to allow their politicians to take a personal part in negotiations is a dangerous innovation in diplomatic practice Clearly says Nicolson," there are moments when it is essential that the Prime Minister or the Foreign Minister should attend important conference Yet repeated personal visits on the part of the Foreign Secretary of one country to the other should not be encouraged Such visits arouse public expectation, lead to mis understandings and create confusion"

This is perhaps substantiated by one known fact from Indian experience Mr Nehru's visit to the President of the United States in 1949 did raise expectations which were not fully realized the misunderstandings between the USA and India for some years might, in part, be explained by this As against this I must point out that Mr Nehru has himself used personal contacts with Heads of Governments and Foreign Ministers as a major technique of his diplomacy, visiting them in their own country or receiving them in India and having discussions with them on a variety of international issues and feeling satisfied with the results.

The broad conclusion seems to emerge from India's experience that personal contacts at the highest level would be a valuable means to a newly independent State of understanding the men in charge of affairs in the leading States and the political climate in which they operate they would also help to get useful information and to put across its attitude or approach to international issues (as distinct from the details of agreements) which could not perhaps be done as effectively without such personal contacts

(From the Statesman)

(Continued from page 297)

because the men who are concerned with human values and with making life worthy to be lived are still living in imagination in the dear pre industrial world the world that has been made familiar and comfortable by the literature of Greece and the pre industrial achievements of the poets and artists and composers whose work we rightly admire

The separation of science from culture is a modern phenomenon Plato and Aristotal had a profound respect for what was known of science in their day The Renaissance was as much concerned with the revival of science as with art and literature Leonardo da Vinci devoted more of his energies to science than to painting The Renaissance architects developed the geometrical theory of perspective. Throughout the eighteenth century a very great deal was done to diffuse understanding of the work of Newton and his contemporaries But from the early nineteenth century onwards scientific concepts and scientific method became increasingly abstruse and the attempt to make them generally intelligible came more and more to be regarded as hopeless The modern theory and practice of nuclear physicists has made evident with dramatic suddenness that complete ignorance of the world of science is no longer compatible with survival On this ground above all others I am happy to be associated in the work which the Kalinga Prize exists to promote"

THE WEST INDIES

WHEN, on March 25, 1958, the first elections to the House of Representatives of the newly established federation of the West Indies took place, some of Britain's oldest colonies embarked on the final stage of their progress towards full self government By their decision to unite and to pool their human and material resources a decision actively encouraged by the United Kingdom— these small islands have brought within their reach the prospect of a political, economic and social independence which none of them individually would have been strong enough to sustain

Thus, in co-operation with the people of the area Britain is again implementing her declared policy of guiding dependent territories towards self government within the Commonwealth

The federation has already come formally into existence with the taking up of his office on January 3 by the Governor General Lord Hailes It unites the 10 colonies of Barbados Jamaica Trinidad and Tobago the Leeward Islands of Antigua Montserrat, and St Christopher Nevis Anguilla and the windward Islands of Dominica Grenada, St Lucia, and St Vincent

It will have a total population of approximately 3 000 000, a majority of whom are of African descent but with a substantial Indian minority principally in Trinidad where the capital of the Federation will be situated

The mainland colonies of British Guiana and British Honduras and the small Virgin Islands colony have chosen to remain outside the federation for the present but the constitution makes provision for their accession later if they should so decide

The islands forming the federation some of which have been British possessions since the early 17th century vary considerably in size, population and degree of economic development— from Jamaica with an area of 4 411 square miles and more than 1,500 000 people and a large number of well established modern industries to Montserrat 32 square miles in extent with a population of 14 000 living almost entirely by agriculture

Diversifying The Economy

Both economic and social progress in the West Indies have been hampered by the area's two major problems overdependence on sugar, whose price is subject to severe fluctuations in world markets and overpopulation in relation to natural resources Efforts to overcome these problems have had considerable success in recent years

The economy of the region has been diversified by increasing production of alternative crops, such as citrus fruits, and by industrial development Marketing arrangements (such as the Commonwealth Sugar Agreement under which Britain and Canada guarantee to take the bulk of sugar output at fixed prices) have helped to stabilize some of the principal agricultural industries and have enabled them to plan for the future with confidence

Financial aid under the the provisions of the Colonial Development and Welfare (C D and W) Act has enabled individual territories to undertake long term economic and social development plans

Even in the larger and richer islands, the economy remains predominantly agricultural with sugar still the principal export crop, bananas an important second, and substantial quantities of citrus cotton cocoa, coffee coconuts rice arrowroot, and spices. Small scale processing industries have been built up everywhere and in Jamaica Barbados, and Trinidad there has been a considerable development of manufacturing industry

Growth of Industry

The range of manufactured goods is growing steadily and now includes such items as cement textiles and clothing paper, plastics pharmaceuticals paints and varnishes

Heavy industry is represented by oil production and refining in Trinidad and bauxite mining and processing in Jamaica Trinidad's oil industry developed by British capital, accounts for over three-quarters by value of that colony's exports and contributes about a third of the total revenue Jamaican bauxite—developed only since World War II largely by Cannadian capital—has been strikingly successful and both mining and processing are being expanded rapidly

Social progress in the area has benefited substantially from C D and W funds which have helped in the provision of new schools and hospitals, in the extension of health and wel-

fare services of all kinds, and notably in financing the University College of the West Indies in Jamaica and its associated teaching hospital Sums totalling nearly £4 000 000 have been allocated to these institutions which have for the first time provided the region with its own centre of advanced education medical training and research

In educational development a special place has been given to the extension of facilities for technical and vocational education in order to provide the area with the technicians and skilled farmers it will need in the future and to the expansion of home economics education is designed to prepare the individual for family living and to encourage a sense of social responsibility to the family and the community

Political Advance

The advance to federation has not been made at the expense of political progress within the unit territories where developments since the end of World War II have been rapid

Jamaica, Trinidad, and Barbados now each has a large measure of internal self governments under a Chief Minister or Premier who is the leader of the majority party in the legislature and who chooses his ministerial colleagues

All the territories have elected majorities in their legislatures elected on the basis of universal adult suffrage and all have elected local people serving as Ministers or Members —that is members specially associated with the conduct of and responsibility for particular departments of government

In the first instance the powers of the federal Government, which have been closely defined in the constitution will not be great and residual legislative and executive authority will rest with the unit governments

The United Kingdom retains the right to legislate by Order in Council only on matters concerned with defence external relations or the financial stability of the federation and the Governor General retains certain reserve executive powers although in most matters he is required to act in accordance with the advice of his Council of State

The federal Parliament will consist of a nominated upper chamber—the Senate composed of 19 members appointed by the Governor General (two representing each territory except Montserrat, which will have one) and an elected lower chamber—the House of representatives with 45 members (17 elected by Jamaica 10 by Trinidad five by Barbados one by Montserrat and two by each of the six other colonies)

Executive authority will be vested in the Governor General as the Queen's representative advised by a Council of State consisting of a Prime Minister (elected by the House of Representatives from among its own members) and 10 other Ministers (appointed by the Governor General on the advice of the Prime Minister not less than three being members of the Senate and the rest members of the House of Representatives)

No member of either chamber of the federal legislature may serve at the same time on either the legislative or the executive council of any of the unit territories.

UK. Financial Aid

The United Kingdom has promised to continue after federation the various forms of financial aid which have been given to the unit territories in the past For example until the attainment of independence the federation will still be eligible for grants and loans from the United Kingdom CD & W funds (for the period 1946-60 nearly £37,500 000 has been allocated from this source to all the West Indian colonies)

Grants-in aid to enable the poorer islands to balance their budgets—in the period 1946 56 these totalled £8,500 000—will be continued for at least 10 years Britain's Colonial Development Corporation which is at present engaged in 16 economic development schemes in the Caribbean for which sums amounting to over £7 500 000 have been committed will be able to continue its activities

In addition the United Kingdom has offered a contribution of up to £1 000 000 towards setting up the federal capital in Trinidad

DESIGN FOR YOUTH

What is the younger generation coming to? Things were not like that in my day! People of every generation make this sort of remark about the next forgetting that their own fathers and grandfathers said exactly the same thing before them for guiding young people into activities that will benefit both them and the community has always been a problem and probably always will be

One of the ways of getting girls and boys to take part in the life of the community in which they live and work is through move ments and extra curricular activities And in fact never before have there been so many special activities arranged for youth There are special organizations and clubs in every country To help them expand and dovelop their projects on an international level Unesco has set up a system known as the Associated Youth Enterprises

This term can best be explained by an example and the one I have chosen is a youth enterprise sponsored by the French National Commission for Unesco and organized by the French Institute for Popular Education

It was a study course on low cost home decoration held in a chateau at Marly le Roi just outside Paris for youth groups from all over France which were planning special decoration projects

I dropped in on the seminar during its final day of work and was struck by the friendly atmosphere Boys and girls had come from all over the country to exchange ideas with one another and profit from the ex perience of well known architects and decora tors What particularly impressed me was the complete freedom with which the young people discussed matters with their advisers—I use the word adviser rather than instructor since the adults were there only to answer questions and to solve t chnical difficul ties

The purpose of the meeting was not to train technicians or specialists but to sti mulate good taste and new ideas about de coration colour harmony and so on and as a by product to encourage the do it yourself approach Its title Le decor dans la vie quotidienne is difficult to translate into English since the French word decor means both decoration and setting What the course set out to prove was the need for a pleasant setting both in the home and in community life

These goals are important ones especially the latter You realize this immediately when you see some of the war memorials that mar many of the villages of Europe It is quite likely that entirely different monuments would have been designed if the people who have to live w th them every day had been able to express their true tastes

The French National Commission for Unesco probably had such examples in mind when it convened this seminar for youth groups During the short time the course lasted it achieved quite a number of things Here are a few examples

One group of half a dozen youths had the task of drawing up plans for a cultural centre in Valencay a small town in the centre of France When I arrived the discussion was proceeding at full steam with each member explaining his ideas to his fellow trainees and to the adviser a young decorator The plans for the centre included a lecture hall with a stage and a film projector a library and a sound proof room for a television set and a record player

The seminar gave this team of youngsters a chance to benefit from the experience of well known specialists including an architect and the chief window dresser of a Parisian department store The architect who happend to have an office in the town of Chateauroux near Valencay became so enthusiastic that he agreed to handle all the technical problems of the new centre without charge

Another group had an entirely diff erent problem It was planning to s t up acultural and recreation centre for workers in a shoe factory at Nancy in eastern France. The factory had offered plenty of space for the centre the plans were very appealing and the engineers willing to help the young wor kers carry them out

But there was another problem, this time

a psychological one Since the centre would be on the factory premises how should one set about getting the young workers to return to the scene of their jobs for a social or recreational evening? The team was well aware of this problem but its members had plenty of imagination and they seemed confident that ways could be found to attract their fellow workers to the centre

Other groups were studying other projects It is early yet to know what the results will be but if these projects are carried out successfully the French National Commission for Unesco plans to encourage similar ventures throughout France Unesco will give a full account of the scheme in its newsletter for 'associated youth enterprises and it is hoped that eventually groups in other countries may start similar projects (*Jean Benoit Levy*)

GIUDE TO CAREFRS AUXILIARY CORPS

The Auxiliary Cadet Corps was started in June 1953 as a supplementary movement to the National Cadet Corps in order to cover larger numbers of students than could possibly be done by the latter

The aims of the Auxiliary Cadet Corps are

(a) firstly to build up the youth mentally morally and physically and to make them good and disciplined citizens by developing their character and capacity for leadership

(b) secondly to develop in them a sense of patriotism

(c) thirdly to develop in them team spirit corporate life and self-confidence and train them for social service and

(d) fourthly to teach them the dignity of labour

During the last few years the A C C. has expanded rapidly and caught the imagination of the public

When the Corps was first raised the training syllabus was not sufficiently broad based and adequate enough to achieve the aims effectively and efficiently In order to make the Corps more and more educational in character by softening the regimentation of parade-ground drill and mass physical training a Syllabus Committee was set up by the Government of India on December 30 1955 under the chairmanship of the Deputy Defence Minister The Committee evolved a revised training syllabus for the A. C. C. designed to cover a number of subjects to be taught to a cadet during his period of stay in the Corps which is normally of three years duration The syllabus consists of basic training which is obligatory for all cadets and supplementary training which envisages the development of hobbies, arts and crafts and other cultural activities This syllabus has since been approved by Government and its implementation is now in progress in the various States

Basic training which is given during the normal school hours by allowing one period of 40 minutes daily except on Saturdays, Sundays and other holidays includes subjects like practical citizenship physical training team games drill first aid sanitation and hygiene and field-craft Training in field craft is given only during the third year of the cadet's training but girl cadets are taught home nursing instead The year wise syllabus has been so evolved as to provide for progressive training in each year

Supplementary training which is conducted outside the normal school programme at week-ends and during vacation, according to the local facilities available, includes subjects like arts and crafts social service work camps and elementary weapon training and firing with .22 rifles This training although not optional cannot, in the strict sense be called obligatory because its successful implementation would mostly depend on the resources available in a school. Training in social service work and camps is, however being implemented to the maximum extent from the funds allotted by the Central Government.

As basic and supplementary training is imparted to cadets by their respective A.C.C. teachers, training of teachers plays an important role in this organisation The aim of training teachers is to acquaint them with the organisation and administration of the Cadet Corps their responsibilities the scope of cadet training and the attainment of proficiency standards by cadets Every teacher who joins the A.C.C has to undergo an initial teachers training course of three weeks duration and thereafter a refresher training course of ten days duration every year

Training courses for teachers are held centrally under arrangements by Circle Headquarters at a convenient place where training aids and facilities are available Such courses are run by the staff of the Regular Army who have normally undergone a special cadre on their posting to the National Cadet Corps During this period of three weeks

teachers are taught the subjects of basic and supplementary training as also the methods of imparting these to cadets In addition to this they are given training in the prepara tion of A C C training programmes and camp training As such courses are held in the form of a camp excellent opportunity is provided to teachers in gaining practical ex perience in the organisation and administra tion of camps The training is made as realistic as possible

After successfully completing their train ing, teachers are appointed A C C Section Leaders in their respective institutions and made responsible for training A C C sections raised there Teachers for this type of training are selected from schools by the Education Department of the State Govern ment concerned where it is intended to introduce the A C C The responsibility for training teachers rests entirely with the State Governments because these courses are enti rely financed by them Teachers are provided free conveyance for their journey and also free messing for the duration of the course

SAHITYA AKADAMI AWARDS FOR 1957

The Prime Minister Shri Jawaharlal Nehru presented the Sahitya Akademi Awards for 1957 for outstanding books published in the Indian languages during the preceding three years that is 1954 to 1956 at an informal ceremony held in the Conference Room of the External Affairs Ministry on February 24

The following five books were adjudged as the most outstanding books published during this period —

	Language	Name of Book	Author
1.	Bengali	Sagar Theke Phera (Poems)	Premendra Mitra
2.	Hindi	Buddha Dharma Darshan (Philosophy of Buddhism)	Late Acharya Narendradeva
3	Malayalam	Chemmeen (Novel)	Thakazhi Sivasankara Pillai
4.	Telugu	Sri Ramakrishnuni Jivita Charitra (Life of Ramakri (shna Paramahamsa)	Chirantanananda Swami
5.	Urdu	Mir Taqi Mir A critical study of the great Urdu poet Mir)	Dr Khwaja Ahmad Faruqi

The award for the outstanding books in Hindi was received by Shri Harsha Vardhan son of the late Acharya Narendra deva

The awards were given in the form of a cheque for Rs. 5 000/ and an attractive copper tablet in which the names of the author the name of the book and the year of the award are inscribed The signatures of the Akademi s President Sri Jawaharlal Nehru are also inscribed on the tablet

Every year since its inception in 1954, the Sahitya Akadami awards prizes on outstanding books published in Indian languages

Books are eligible for prizes in 16 languages, viz , the fourteen major languages enumerated in the Constitution of India and Sindhi and English (as written by Indian authors) There are two Prizes for Sanskrit, one for creative writing in Sanskrit the other for scholarly research or exposition relating to Sanskrit written in any language To be eligible for award a book must have been originally published during the three years preceding the year in which the Award is announced

* * *

THUMB NAIL SKETCHES OF RECIPIENTS

1 *Sagar Theka Phera* (Poems) Language Bengali Originally published in 1956 The author, Shri Premendra Mitra (b 1904 in Banaras) is a leading poet short story writer and essayist of contemporary Bengal His writings reflect his deep and passionate sympathy for the poor and the underdog and are marked by depth of thought and distinction of style

2 *Buddha Dharma Darshan* (A Survey of Buddhist Philosophy) Language Hindi Originally published in 1956 This is the last published work of the late Acharya Narendra Dev distinguished scholar educationist and Socialist leader Born in 1880 in Sitapur (Uttar Pradesh) Acharya Narendra Dev combined in himself the best virtues of the old and new generations A valiant fighter for India s freedom and one of the founders of the Socialist Party of India he

was a scholar writer and educationist of rare distinction He founded the Kasi Vidya Peeth and was Vice Chancellor of Lucknow and Banaras Universities and a member of Parliament Buddha Dharma Darshan is a masterly survey (running to 616 pages royal size) of the development of Buddhist metaphysics and logic.

3 *Chemmeen* (Novel) Language Malayam Originally published in 1956 The novel depicts the life of humble fisher folk in the coastal region of Kerala The author Shri Thakazhi Sivasankara Pillai (b 1914 in Ambalapuzha Kerala) is a leading short story writer and novelist. He was one of the original promoters of the Progressive Writers Association in Kerala Most of his stories and novels portray life of the peasants and the working class Agriculturist by tradition lawyer by profession and writer by choice Shri Thakazhi is well known for his dynamic approach to problems social and political The Akademi has selected his earlier novel Rantitangazhi for translation in the major Indian languages The Hindi version Do Ser Dhan is already published

4 *Sri Ramakrishnum Jivita Charitra* (Life of Sri Ramakrishna) Language Telugu Originally published in 1956 The author Sri Chirantanananda Swami (b. 1906 at Mummidivaram Andhra Prades) is a gifted prose writer and has written nearly 20 books dealing with the philosophy of Ramakrishna and Vivekananda His writings are marked by distinction of style and terse expression of suitable philosophical thoughts

5 *Mir Taqi Mir* (A critical study of the great Urdu poet Mir) Language Urdu The author Dr Khwaja Ahmad Faruqi (b. 1917 in Bachhraon dt Moradabad, Uttar Pradesh) is head of the Department of Urdu Delhi College University of Delhi He is a distinguished scholar and critic and was the delegate of the Delhi University to the 24th International Oriental Congress held in Munich, West Germany 1957 He is a fellow of the Royal Asiatic Society of Great Britain

LITERATURE FOR CHILDREN

The Ministry of Education and Scientific Research have announced the results of the third competition of best books for children under the Government of India's scheme of Encouragement of Literature for Children"

The authors of the following 22 books/Mss are each awarded a prize of 500/ —

Language		Name of the Book	Author	Age Group
ASSAMESE	1	Ghumati Jaore	Dulal Ch Barthakur	3-6
	2	Akhatar Jakhala	Prof Nalu Barua	7 14
BENGALI	3	Nije Path	Smt Sukhalata Rau	3 6
	4	Ghanadar Galpa	Premendra Mitra	7 14
GUJARATI	5	Pashu No-Kakko	R P Soni	3 6
	6	Padarna Pankhi (Pt I)	Manubhai Jodhani	7 14
HINDI	7	Chitra Me Ek Do Tin-Char	Braja Rai Chaudhuri	3 6
	8	Hamare Pakshi	Rudra Datt	3 6
	9	Doodh Batasha	Sohan Lal Dwivedi	3 6
	10	Prakash Ki Baten	Brahma Nand Gupta & Naresh Vedi	7 14
	11	Neelam Aur Masahri Ki Desh	Smt Sharda Mishra	7 14
KANNADA	12	Namma Bhoomi	Damodar Baliga	7 14
MALAYALAM	13	Onappakshi (MSS)	T V John	3 6
MARATHI	14	Bahulatachi Kak Kak (MSS)	Smt S[illegible] Paga[illegible]kar	3 6
	15	Bhilla Vir Kalinga	G.N. Dandekar	7 14
ORIYA	16	Futu Katu	Udayanath Sarangi	7 14
PUNJABI	17	[illegible] Forest (MSS)	R.S. Ahluwalia	7 14
SINDHI	18	Latuvon (MSS)	Goverdhan A. Mahbubani	7 14
TAMIL	19	Kas Imiyum Piras thural	N F Nag[illegible]an	7 14
TELUGU	20	Nartana Bala	Natraj Rama Krishna	7 14
URDU	21	Hazaron Baras Men (MSS)	Safdar Abbas Naqvi	7
		[illegible]	[illegible]	7

Two thousand (2 000) copies of each of the prize winning books will be purchased for distribution in Schools Libraries Children s Centres etc at a price which the Ministry considers reasonable in view of rates prevailing in the market less 25% discount as allowed by Publishers on bulk purchase on the condition that the get up of the book is to the satisfaction of the Government of India

* * *

FOURTH PRIZE COMPETITION ANNOUNCED

The Ministry of Education and Scientific Research have also announced the holding of fourth competition for books for children The authors and publishers of books manuscripts in Hindi Sindhi and Urdu may submit their entries to the Assistant Educational Adviser (B & S) Ministry of Education and Scientific Research New Delhi directly

Entries for books and manuscripts in other Indian languages should be submitted to the State Governments concerned as follows

Assamese	Assam
Bengali	West Bengal
Kanada	Mysore
Kashmiri	Jammu and Kashmir
Marathi & Gujrati	Bombay
Malayalam	Kerala
Oriya	Orissa
Punjabi	Punjab
Tamil	Madras
Telugu	Andhra Pradesh

The last date for the receipt of books and manuscripts in Hindi Sindhi and Urdu is August 31 1958

Books and manuscripts in Hindi Sindhi and Urdu should be submitted to the Assistant Educational Adviser (B & S), Ministry of Education and Scientific Research M Block New Delhi

As regards books in other regional languages entries should be submitted to Education Secretaries of the States concerned before August 31, 1958

Details regarding language subject matter illustrations number of copies to be submitted and other particulars may be had from the Special Officer (Literature) Ministry of Education and Scientific Research Government of India New Delhi,

* * *

PRIZE FOR STANDARD MANUALS IN HINDI

The Ministry of Education and Scientific Research will award three prizes of, Rs 1 500/ 1 000/ and 500/ for standard manuals in Hindi for general reading in each of the following five subjects

1. Mathematics
2. Chemistry
3. General Economics
4. Agriculture, and
5. Education

The awards are meant primarily to encourage the use of Hindi terminology evolved by the Government of India Terminological lists relating to the five subjects mentioned above can be obtained from the Under Secretary (Hindi) Ministry of Education and Scientific Research, New Delhi

The books should explain in non technical language the basic principles and the utility of the subjects with practical examples and suitable illustrations The books should not be of more than 200 pages in print and should be *adequately illustrated*

Intending authors are requested to submit 6 copies each of their books manuscripts along with a brief note containing particulars about the author etc to the Under Secretary to the Government of India Ministry of Education and Scientific Research Hindi Division, New Delhi so as to reach him not later than *September 9 1958*

Each packet of books/manuscripts should be superscribed Standard manuals for prizes

The books/manuscripts submitted in this connection will not be returned and no cost therefore will be paid

The awards are subject to the condition that the books are adjudged to be of a sufficiently high standard and conform generally to the conception of Hindi as defined in Article 351 of the Constitution of India The decision of the Government shall in all cases be final

The Government hope to announce the award of prizes as soon as possible after the receipt of the books No correspondence with regard to the merits or otherwise of any award will be entertained

The Prize money will be paid to the authors of the prize winning manuals in the form of National Savings Certificates

The Government will arrange for the publication of the manuals which win the first prizes if the authors the eof cannot get this done through publishers In such cases the

Government may pay, at their discretion such royalty as they may consider appropriate to the author who will have to surrender all rights in the publication

Further particulars in this connection can be obtained from Under Secretary Hindi Division Ministry of Education and Scientific Research, New Delhi

• • •

EXCHANGE OF STUDENTS FOR TECHNICAL EXPERIENCE

Two offers for practical training of Indian nationals in Metallurgy and Mechanical Engineering have been received from West Germany under the auspices of the *International Association for the Exchange of Students for Technical Experience* The duration of the training will be six months but is likely to be extended at the discretion of the German authorities

Candidates who have passed in 1956 or 1957 and have qualified for at least a second class Bachelor's Degree in Metallurgy or Mechanical Engineering are eligible to apply They should not have more than six months practical experience in the line after graduation and should be below 25 years of age on April 26 1953

The candidates will get about DM 300-344 (about Rs 340/ to 390/) per month as remuneration from the firm The cost of passage both ways will have to be borne by the candidates themselves

Application forms and other relevant information may be obtained from the Ministry of Education & Scientific Research (Scholarships Division, Section S-9) Government of India New Delhi

The last date for the receipt of applications in the Ministry is April 26 1958

• • •

AUSTRIAN GOVERNMENT SCHOLARSHIPS

The Government of Austria have offered two scholarships to Indian Nationals for post graduate study research in any branch of Engineering or Medicine during 1958-59

The value of each scholarship which is tenable for at least 9 months is approximately Rs 350.00 p.m. The cost of tourist class sea passage to and from Austria will also be provided

Candidates should possess a good degree (preferably first class) in engineering or medicine and two years teaching or research or [illegible]

zation after graduation in the subject concerned and adequate knowledge of German language They should not be more than 35 years old

Prescribed application forms and other information can be had from the Ministry of Education & Scientific Research Scholarships Division (S 18) New Delhi

The last date for the receipt of applications in the Ministry is April 10, 1958

• • •

RESEARCH SCHOLARSHIPS IN HUMANITIES

The Union Ministry of Education and Scientific Research invites applications for the award of research scholarships in Humanities. Each scholarship is of the value of Rs 200 p.m. and is normally tenable for two years *Under the Scheme, not more than 100 research* scholarships will be awarded during 1958.

Application forms can be had from the *Ministry of Education and Scientific Research* Scholarships Division (Section S-6) New Delhi

The last date for submission of applications to the Head of the University or Institutions last attended or from which the M.A. degree was obtained, *is June 2 1958*

The object of the Scheme which was first initiated in 1953 is to stimulate research in various fields of Humanities specially in those subjects which have not for one reason or another received adequate attention in the past

The Government of India have so far awarded 179 research scholarships during the past five years

University Forum

COMMUNITY DEVELOPMENT AS A UNIVERSITY SUBJECT

Seven Universities namely Agra Nagpur Aligarh, Visvabharti Andhra and Annamalai had agreed to include the subject 'Community Development in their syllabi for the degree and post graduate examination in Economics, said Shri S K Dey Minister for Community Development in a written reply to a question in Rajya Sabha Inclusion of Community Development as a subject in syllabi of universities is one of the steps proposed by the Ministry of Community Development in order to effect a greater coordination between the C.D programme and the universities The Estimates Committee had recommended that such a step would also ease the problem of training the vast number of workers engaged in the implementation of the programme

* * *

FREE AND COMPULSORY EDUCATION

Replying to a question in the Lok Sabha regarding free and compulsory education Dr K L Shrimali laid the following statement on the *table of the* Sabha

The question of providing free and compulsory elementary education in the country was reviewed by the Planning Commission at the time of formulation of the Second Five Year Plan and their views have been stated at pages 503 505 of the publication entitled Second Five Year Plan

This question was again reviewed recently by the Panel on Education of the Planning Commission in their meeting in July 1957 The panel made the following recommendations in this connection

(i) the provision of universal free and compulsory education upto 14 years should be regarded as the *ultimate* objective and an attempt should be made to realise it in a period of 15 to 20 years at the latest and

(ii) the immediate objective before the country should be the introduction of universal free and compulsory education for all children upto the age of 11 This target must be reached by 1965 66 at the latest

The question was further discussed in the conference of the State Education Ministers held in September 1957 The conference endorsed the above mentioned recommendations of the Panel subject to the availability of the required funds

In the programme for the Third Five-Year Plan the State will endeavour to provide free and compulsory education to all children upto the age of 11 years

* * *

GENERAL EDUCATION IN UNIVERSITIES

The Universities of Sri Venkateswara Baroda Calcutta Bombay Delhi Lucknow Madras, Osmania Patna Poona Roorkee Utkal Aligarh Andhra and Mysore have agreed to introduce General Education Courses said Dr K.L Shrimali in reply to a question in the Rajya Sabha on February 27

In reply to another part of the question the Minister stated that under the exchange of personnel aspect of the Ind a Wheat Loan Educational Exchange Programme 9 U S educationists were invited to Ind a in September 1957 and placed at the Universities of Osmania Lucknow Baroda Poona Patna Bombay Roorkee Madras Sri Venkateswara, Utkal and Delhi to advise and assist them in formulating programmes of General Education They have since left India after completing their assignment

The Universities were busy in considering and formulating their programme for the introduction of General Education Courses

* * *

IMPROVING TEACHING OF ENGLISH IN INDIA

In order to improve the teaching of English both through the organisation of research in the teaching of this subject and the training of teachers in the most suitable techniques the Government of India have decided to establish an English language teaching institute at Hyderabad This has been necessitated due to the falling standard of English in India

especially at the secondary school stage of education

The Institute will function under the management of an autonomous body to be known as the Board of Governors which will be registered under the Society's Registration Act of 1860

The main objects and functions of the Institute will be as follows

(a) To train High School teachers of English, Training College Lecturers and Inspectors from the various States of the Union in the use of modern techniques for teaching foreign languages

(b) To conduct research into the special problems of Indian Students of English and to adopt syllabuses based on structural analysis to fill the needs of speakers of Indian Languages

(c) To conduct research into the writing of suitable textbooks and the preparation of visual aids

(d) To advise State Governments on syllabuses examinations and Training Colleges curricula and allied topics

(e) To publish such journals or papers as would further the objects of the Institute

(f) To train English teachers of other countries of South Asia which may not have made similar provision for imparting modern methods of teaching foreign languages

Composition and Powers of the Board

The Board of Governors shall be created and supported by funds placed at its disposal by the Government of India It shall consist of not more than 11 persons including the Chairman i.e. educational experts and one representative each of the Ministry of Education and Scientific Research and the Ministry of Finance all of whom will be nominated by the Government of India The composition of the Board for the first two years shall be as follows —

(i) [illegible] Secretary to the Government of India Ministry of Education & Scientific Research [illegible] Chairman

(ii) Dr A M D [illegible] Joint Educational Adviser to the Government of India Ministry of Education & Scientific Research

(iii) Prof N K Sidhanta Vice-Chancellor Calcutta University

(iv) Shri N N Wanchoo, I C S, Secretary to the Government of India Ministry of Finance

(v) Prof C S Bhandari Director, English Language Teaching Institute Allahabad

(vi) Shri Samuel Mathai Secretary University Grants Commission

(vii) Shri A R Dawood Deputy Director All India Council for Secondary Education

(viii) Shri J Forrester Principal St Christopher's College Madras.

(ix) Dr G S Banerjee Principal Ismail Yusuf College Bombay

(x) Dr H N Kunzru M P

(xi) Director ex-officio (Member Secretary)

In the Board of Governors shall be vested full powers to conduct business of and manage the Institute within such rules and regulations as may be framed with the prior approval of the Government of India It shall also be entitled to take such action as may be necessary for the furtherance of the programme and objects of the Institute

The Institute when established is likely to receive assistance from the *Ford Foundation* or the British Council in the form of instituting professorships or scholarships in the Institute

• • •

FUTURE OF PUNJAB UNIVERSITY (CAMP) COLLEGE

It is proposed to continue the Punjab University (Camp) College pending its gradual conversion into one of the four evening colleges which are proposed to be set up under the aegis of the University of Delhi This was stated by *Dr K L Shrimali* in the Lok Sabha on March 8.

Some negotiations had already taken place between the Vice Chancellors of the Universities of Punjab and Delhi in regard to the nature of arrangements to be made for the closure of the Punjab University (Camp) College classes and their gradual replacement by the Delhi University evening colleges certain [illegible] in this connection has been worked out

• • •

PRIMARY EDUCATION IN UNION TERRITORIES

Dr K L Shrimali said in the Rajya Sabha on Feb 27 that Primary Education was generally free in the Union Territories

He further disclosed that 2 65 lakhs children were receiving free primary education in the Union Territories during 1955 56

The position regarding free Primary Education in the Union Territories is as follows—

1 *Andaman and Nicobar Islands*
Primary Education is free

2 *Delhi*
Free primary education is imparted upto the age of 11 years Concession of free education upto the age of 14 years has also been extended in all Senior Basic Schools in rural areas of the Territory

3 *Himachal Pradesh*
Primary education is free

4 *Laccadive Minicoy and Amindive Islands*
Primary education is free

5 *Manipur*
Education is free at the Junior Primary stage

6 *Tripura*
Education is free in all Government Schools from class I to V

* * *

INCREASED FACILITIES FOR TEACHING SCIENCE AT DELHI UNIVERSITY

Dr K L Shrimali in a statement laid on the table of the Lok Sabha gave details of the steps taken to provide increased facilities for teaching of science subjects in the B Sc (Pass) and B A (Honours) courses at the Delhi University

The question of making increased provision for the teaching of Science Subjects in the B Sc (Pass) and B Sc. (Honours) Courses was considered by the Faculty of Science and by the Academic Council and the Academic Council has resolved as follows

(1) There should be progressive increase (20 per cent to 25 per cent each year)in the number of students admitted to the Honours Courses in Physics and Chemistry with a view to effecting a general increase upto 100 per cent in the number of Science Honours students by the end of five years

(2) There should be a progressive decrease in the number of B Sc. (Pass) students directly taught in the University and the number brought to a minimum which will be needed to meet the needs of the campus and neighbouring areas and

(3) that the colleges located in the out lying areas be permitted to have B Sc (Pass) class s and/or increase the number admitted along with the progressive decrease in the number of B Sc (Pass) students directly taught in the University

These recommendations of the Academic Council have been considered and accepted by the Executive Council.

The Academic Council has appointed a Sub Committee to consider the steps to be taken in connection with the increase in the number of students admitted to Honours Courses in Physics and Chemistry Financial implications are being worked out by the Sub-Committee

* * *

PRODUCTION OF PENICILLIN AT PIMPRI

The output of penicillin at the State-owned factory at Pimpri near Poona the only factory for producing penicillin in India rose to nearly 23 6 million mega units during 1957 The produce in 1956 was 14 1 million mega units

In terms of finished product for clinical use the production of penicillin was nearly 17 9 million mega units during 1957 as compared with 5 2 million mega units in the preceding year

During December 1957 alone penicillin worth Rs 22 71 lakhs was supplied to civil and military hospitals and to commercial distributors for sale to the public This marks an increase of Rs 1 77 lakhs over the sales effected in the preceding month

The Pimpri factory employs over 700 workers including the staff of the bottling plant in Bombay

The capacity of factory is further to be increased by 60 per cent by the installation of additional plant and equipment to meet the increasing requirements of penicillin in the country Equipment for the expansion programme has been arriving in Pimpri and some of the items are already in the process of erection

A project to manufacture streptomycin in the Pimpri factory is being considered by Govt The scheme envisages the manufacture of 15 000 to 20 000 kilograms of streptomycin at an estimated cost of Rs 1 12 crores

LETTERS to the EDITOR

Letters from the readers giving their own opinion or point of view on all interesting subjects are published in these columns. Letters should be brief to the point, neatly typed double space. They may be written under a pseudonym but must be accompanied by writer's name and address. The views expressed here do not necessarily reflect editorial opinion or policy.

HINDI AS LINGUAFRANCA

Sir,

I was pained to read the article on Lingua franca by Gen. K. M. Cariappa in your issue of January, 1958. He being a patriot and a beloved ex soldier of the country has taken in view only one side of the picture. I agree with him for the good English has done and can do but can we overlook the use of Hindi? We can have voice in the international field only when our nation is strong. History stands witness that no nation has progressed by fostering a foreign language and ignoring its own language and culture. The very foundation of a nation is its common language. After hard-earned freedom we are trying for consolidation of our nation. By adopting English as our linguafranca we will be only good followers and not progressive leaders.

Only Hindi can be our national language. It is neither over sentimentalism nor fanaticism but true nationalism and self respect without which a nation cannot survive for long. Let us open the gates of Hindi and adopt foreign words to enrich it. English too has become popular only by welcoming words and phrases of Latin, Greek, French, German etc. Hindi is the language of the common man in India. The intelligentsia may study English just as it may learn Russian, French or Chinese. But the aim of the 370 million Indians should be to learn and gain from Hindi and let Hindi be enriched by them. Thus only Hindi will become a world language of a leading nation.

Jamnagar   Yours etc.
11 1 1958   Yash Pal Chopra

PLIGHT OF TRAINED TEACHERS

Sir,

I was astonished to read your article Guide to Teachers (High School) in which you have said that the employment for the trained teachers is quite easy to seek. There is such a shortage of trained teachers that any person who satisfies the minimum qualification can get early employment. But the things are quite contrary in the Punjab. There is a large number of trained graduate teachers who cannot get employment anywhere. There are some trained graduates who are employed temporarily but their service is broken after three months and they are reappointed. Sometimes they are relieved of their duties after three months. Such is the ill luck of the trained graduate teachers in the Punjab.

What is the sense of establishing new training colleges in the State when the already trained graduates cannot find employment? Will the Central Government and the Government of the Punjab take note of this fact and employ the B.T. and B.Ed. people who are hankering after the national school managers to work on small salaries?

I think there are about 3,000 trained graduates who are sitting idle at home. What sin have they committed for which they have to pay in the form of unemployment?

V. P. O. Mehraj   Yours etc.
8 2 1958   Gurdev Singh

DIMINISHING RETURN

Sir,

In your monthly magazine "Careers and Courses" of February 1958 the answer to Tulsi Kumar Dixit's question about the law of diminishing marginal returns is wrong. The answer of the question is as follows:—

When the production does not increase in proportion to the production cost or investment, it is known as the law of diminishing marginal returns. There is no exception to the above mentioned general rule as it has

large or small scale productions or any other kind of production Its exception depends upon the period of time In a limited period total production of a certain area of land can be increased according to the law of increasing returns by the help of skilled labour scientific gadgets improved seeds better manures irrigational facilities, etc Scientific rotation of crops, improved seeds modern implements and other factors help in the increase of production and are bound to give increasing returns But for a long period it is quite impossible because land has a limited power of fertility The law of increasing returns applies only for a short and limited time After a few years the law of diminishing marginal returns will apply

The law is more impressive in agriculture than in other fields It applies mostly to cultivation The exceptions of the law are unimportant and only possible for a short period In practice we can feel the law of diminishing marginal returns in cultivation directly or indirectly

Hasanchak (Bihar) Yours etc
8 2 1958 Harendra Kumar Dutta

* * *

DEPUTY DEFENCE MINISTERS

Sir

There is a misinformation in the fourth article Union Government, published in the Special General Knowledge Supplement to the Careers & Courses of February 1958 You have published Surjit Singh Majithia as our Deputy Defence Minister But it is wrong He is not our Deputy Defence Minister Kotta Raghuramayya is our Deputy Defence Minister So we would be glad if you publish the correction

Fort Devupalle Yours truly
7 2 1958 A.G Prasad

(Both are Deputy Defence Ministers in the Union Government—Ed)

* * *

CINEMA TERMS

Sir,

In the issue of March 1958 the definition you gave for Colour by Delux under Cinema Terms (Page 231)—that it indicates by whom the colouring of the film has been done — i not correct It is only a name of the process by which a particular film has been processed into colouring just like Technicolour Warner colour Gevacolour Natural colour Sovcolour etc

Vijayawada Yours etc
6-3 1958 V Lakshamana Charyulu

(The different processes of colouring are patented The film producer has to mention the method used in colouring his film The basic principle of colouring films is the same The difference lies only in detailed processing—Ed)

* * *

AGRICULTURAL COLLEGES

Sir,

I am astounded to see in your March, 1958 issue of Careers & Courses on page 231 in reply to a question 'Please name the Agricultural Colleges in India that the names of the West Bengal State College of Agriculture Calcutta—40 and the Jhargram Agricultural College have not been included in the answer though these two are the renowned colleges of Agriculture in West Bengal

Calcutta Yours etc
6-3 1958 Hemanta Kr Brose

(We did not give a full list of Agricultural Colleges in India but mentioned only a few—Ed)

LOCKED UP BEAUTY

I was sitting on the seashore, half listening to a friend arguing about something which merely bored me Unconsciously I looked at a film of sand I had picked up on my hand when I suddenly saw the exquisite beauty of every little grain of it instead of being dull I saw that each particle was made up on a perfect geometrical pattern with sharp angles from each of which a brilliant shaft of light was reflected while each tiny crystal shone like a rainbow Then suddenly I saw how the whole universe was made up of particles of material which no matter how dull and lifeless they might seem were nevertheless filled with this intense and vital beauty For a second or two the whole world appeared as a blaze of glory When it died down it left me with something I have never forgotten and which constantly reminds me of the beauty locked up in every minute speck of material around us

—*Aldous Huxley in Heaven and Hell*

THINGS THEY SAY

Chivalry on public transport these days is more or less a standing joke !

* * *

It is just possible that he who heartily agrees with you at all times is wise but it is more likely that you have something he wants to borrow

SCIENCE & INVENTION

CHEAP H POWER FUEL

Russia claimed on Feb 28 to have found a "deep freeze" method of making deuterium —the fuel for industrial use of hydrogen power— from water "at less than one per cent of the cost of coal."

The Russian claim said that deuterium was produced at minus 250 degrees centigrade and added "this most advanced method has been developed at the Institute of Physical Problems of the Soviet Academy of Sciences.

Several groups of scientists and engineers are designing H power reactor Academician Ivan Kurchatov said in an article published in the Press and broadcast by Moscow Radio.

With these reactors "the fuel problem will be solved practically for ever" the scientists said. The power potential of ordinary water by this process was about 400 times the present potential of petrol.

In a Soviet laboratory test, rarefied deuterium (hydrogen with an atomic weight of two instead of the normal one) was heated to a million degrees centigrade by a two million amperes current and "the emission of neutrons was registered in the process. (The British ZETA at Harwell, has achieved five million degrees).

A report on Russia's thermo-nuclear methods which were slightly different from Britain's, would be made this year at the Geneva International Conference on peaceful uses of atomic energy", Kurchatov stated.

Kurchatov's article was accompanied by a photograph of one of Russia's first "toroidal chambers" (for H power). He said he favoured the idea of using a magnetic field for isolating the "plasma" of ionised gas to prevent the heat affecting the chamber itself —(as is done in Harwell's ZETA).

But he added in future reactors it should be possible for the magnetic field of the electric current passing through the gas to provide the heat insulation itself in a thick-walled chamber for a period of about one second. The means to produce this are technically feasible he said.

Kurchatov, who is Russia's leading physicist accompanied Marshal Bulganin and Mr Khrushchev on their visit to Britain in April, 1956.

• • • •

JAPAN CONTROLS THERMONUCLEAR FUSION

A team of Japanese scientists claimed in Osaka on Feb 8 to have achieved controlled thermonuclear fusion the atomic feat announced by Britain last month.

Thermonuclear fusion the process that gives the hydrogen bomb its power, is the joining together of hydrogen atoms. It is this process that heats the sun.

The Japanese scientists said they had used a vacuum discharge tube containing heavy hydrogen gas for their experiment. They claimed about five million neutrons were created in the tube.

A Japanese scientist claimed that an apparatus for nuclear fusion similar to the British "Zeta" could be built in his country for about 150 million yen (about £ 150,00[illegible] sterling).

Seven Japanese industrial groups are designing nuclear power ships—ranging from a 2,500 ton training vessel to a 65,000 ton tanker the Japanese Atomic Energy Commission has announced.

Four other groups have their own programmes for nuclear reactors to be used at sea.

• • •

FIVE HOURS SAVED THE WORLD

On October 30 1937 the world escaped a major disaster by an "astronomical" hair's breadth—yet amid the worry over the Hitler menace the event passed almost unnoticed.

Some will recall that the world was then becoming more and more concerned with guessing whether Hitler meant to start a war or not. So it was easy to overlook other things which compared with it seemed remote. [illegible] And one of these was the approach of a baby planet.

But in observatories in many parts of the world astronomers were just a little worried They were excited, too

Were their mathematical calculations correct? Would the baby planet—an unknown minor from the solar system—pass by safely?

On the night of October 30th it shaved the earth, missing us by a mere 400 000 miles! You'll say that's a long distance So it is—on earth! But in the heavens it's the merest trifle

The world was saved from a calamity greater than any ever known or conceived by a mere 5½ hours for had the planet reached the earth's orbit that much earlier there would have been a head-on collision. How close it came can be shown another way It takes around 100 000 000 years for the light from some of the distant stars to reach this earth But the light from the unknown planet took only 3 seconds!

Though a miss is as good as a mile, even 400 000 miles is just a trifle too close when it comes to heavenly bodies Even a near miss could produce mighty tidal waves floods earthquakes and volcanic eruptions—all caused by the gravitational pull of the passing body

* * *

HEART DISEASES CAUSED BY VEGETABLE OIL

Is consumption of vegetable oil in any way responsible for causing coronary thrombosis?

The Calcutta Corporation is requesting the Union and the West Bengal Government to make a thorough scientific investigation into the question.

Dr S Mukherjee, Chairman of the Corporation's Health Standing Committee said in Calcutta on February 15 that the Mayor had already been requested to take up this matter with the Government.

Dr Amiya Bose alderman and prominent physician said that scientific analysis of hydrogenated vegetable oil showed that its use might change blood composition in human body leading to coronary thrombosis This question he added had been discussed at the last annual session of the Indian Science Congress at Madras and it was suggested that the Government of India should decide whether its use should be discouraged

* * *

SYRINGE WITHOUT NEEDLE

The new device for mass injections the model of which has been designed by the engineers Trusov and Ippolitov of the Moscow Institute of Experimental Surgical Equipment has no needle The medicine is injected under the skin through a small hole under great pressure The device is simple in operation It is enough to couch the skin, press a a button and a jet of the preparation penetrates under the skin This rapid injection relieves the patient of the unpleasant feeling of pain The new instrument can perform 2 000 injections a day This makes it indispensable for mass inoculations in schools or in the army There is no need to boil the needle and there is considerably less chance of infection The institute staff is currently working on clinical models of this apparatus

* * *

MOON'S TEMPERATURE

The temperature on the moon varies from 120 degrees centigrade above zero when the sun is in the zenith to 150 degrees below zero at lunar midnight in the course of a single lunar day which lasts 14½ terrestrial days These temperatures taken during the observations of lunar surface with the help of thermo elements were disclosed by Dr Markov in the course of his report to the Scientific Council o Pulkovo Astronomical Observatory

The Observatory measures lunar temperatures with the help of a mirror telescope coupled with a thermo element and a radio-telescope Observations have shown that the moon's crust and particularly its outer part, is a bad conductor of heat

A special telescope to be installed at Pulkovo shortly will make it possible to measure—in the millimetre wave band—the temperature of the outer most layer of the moon's crust (to a depth of approximately one centimetre)

* * *

ALGEBRAIC EQUATIONS SOLVED BY MACHINE

A specialised digital computer for solving systems of linear algebraic equations with numerous (upto 400) un known quantities—the first of its kind in Europe—has been developed by Ukrainian scientists The new computer which is called Seam will be used for computing complex hydro-technical construction and other structures as well as for solving problems in geodesy and mathematical physics

During eight hours of operation the will do one month's work of 20

using ordinary calculation machines. The S...m is of much simpler design than the universal electronic computer and it is simple to control as well. It needs only two operators—an engineer and a technician.

COSMIC SPEED ACHIEVED

It is quite possible that a rocket will be shortly fired to the moon or made to circle it as Soviet scientists have almost achieved the second cosmic speed of about seven miles a second which is necessary to overcome the pull of terrestrial gravity and emerge into the expanses of the universe.

Prof. Tigran Melkumov, a noted Soviet expert in motors, writes in *Vestnik Vozdushnogo Flota* (Aviation News) that the fuel problem is a very serious question which is to be solved before cosmic flights can be effected. He says that along with the use of solar energy, which is quite possible outside the earth's atmosphere, very promising is the employment of inter-nuclear energy. Probably the shortest way to solve the problem of the most economical (as regards weight) source of energy is to harness the thermo-nuclear reaction.

STUDY OF MILKY WAY SYSTEM

The detection of radio signals with a wave length of 21 centimeters has opened a new era in the study of the structure of the Milky Way system with its hundred thousand million stars and the similar galaxies in space.

The signals are emitted by atoms of hydrogen and show that tenuous hydrogen clouds fill much of the space between the stars according to a Smithsonian Institution report by Dr. Bart J. Bok of the Harvard College Observatory.

The 21 centimeter waves may be regarded as a kind of invisible light that obeys essentially the same rules as visible, ultraviolet and infra-red light and passes easily through obscuring material. The wave length is slightly lengthened when radiation comes from an object moving away from the observer and slightly shortened when it comes from an object moving toward the observer. These changes are measured and used to determine the speeds of the atoms. The direction from which the waves come reveals the structure of the galaxy and the speeds of the atoms reveal its rotation.

PILLS THAT KEEP WARM

A pill that may increase resistance to cold is being tested at the Arctic Aeromedical Laboratory near Fairbanks, Alaska. According to a report in New York, the pill contains glycine, an amino-acid that causes the body to generate more heat than it can otherwise produce. It is hoped the pill might enable men to stay alive longer in ice water, or to hasten the warming of a man who has been chilled to a critical point of exposure. At the laboratory operated by the Air Force at Ladd Air Force Base, volunteers are taking the pills with no evidence of ill effect. If the tests are successful, the pills could be included in survival kits. Glycine also may make possible a technique of heart surgery in which the heart can be chilled to the point where it stops for an hour or more without suffering damage. According to scientists working at the Air Force laboratory, the heart suffers "ventricular fibrillation" when its temperature is lowered to about 78 degrees Fahrenheit. This is a kind of rhythmic beat which causes death. Hence in heart surgery the organ can be chilled only enough to stop its beating for six or eight minutes. Glycine in the blood stream may enable the heart to be chilled past this critical temperature. Extensive research has been carried out at the laboratory with Negroes, Eskimos and Whites to find out why some ethnic groups seem more resistant to cold than others. Among Negroes who agreed to act as subjects in the experiments, basal metabolism—that is, their rate of energy production—fell more rapidly than it did in white men. Similar studies of Eskimos produced no evidence that their bodies were better equipped for the cold than those of white men. The Eskimos' ability to endure extremely low temperatures seems based on acquired skill and excellently adapted clothing and diet.

NEW PLANET DISCOVERED

The Purple Mountain Observatory at Nanking has discovered a new planet, New China news agency reported on December 8, 1957.

It is the sixth minor planet discovered by the observatory since 1955.

The planet is said to be moving around the sun with an average radius somewhat less than twice the distance between the sun and earth.

RUSSIA CREATES ARTIFICIAL QUAKE

Soviet scientists created an artificial earthquake by firing 1,070 tons of explosives 13[illegible] feet below ground in a remote area of the

PEOPLE IN THE NEWS

MAULANA ABUL KALAM AZAD

Maulana Abul Kalam Azad Minister for Education and Scientific Research passed away at New Delhi on February 22 1958, at 2 15 a m at his residence 4 King Edward Road New Delhi

Maulana Abul Kalam Azad was born on November 11 1888 at Mecca of a Muslim refugee father and an Arab lady In order to escape the wanton carnage let loose by the British in 1857 Azad s father Maulana Muhammad Khairuddin fled to Mecca. In 1880 at the insistence of his followers he returned to Bombay He however often visited Mecca and it was in 1898 that he and his family moved to Calcutta and settled down there In 1905 Azad was sent to the famous Al Azhar University at Cairo for advanced studies in Arabic He mastered Darse Nizami the most advanced course of studies in Arabic and Persian in four years instead of 14 He had a flair for writing poetry and journalism At 14 he was editing a journal in Urdu the *Voice of Truth*

Maulana Azad was elected President of the Congress when India restive for an agitation to overthrow foreign rule was dragged into World War I by the British Government He led the Congress for the longest and the most eventful period not only in the history of that national organisation but also of the country.

The Ramgarh Congress, over which Maulana Azad presided was followed by individual satyagraha for which Mahatma Gandhi chose Acharya Vinoba Bhave as the first satyagrahi

Soon Quit India reverberated throughout the country and the echoes of that rallying cry died down only in September 1946 when Mr Jawaharlal Nehru formed an interim Government in New Delhi

In 1946 Maulana Azad laid down the office of Congress President as participation in national struggles had told on his health

In 1912 Maulana Azad shocked orthodox Muslims with his writings in 'Al Hilal (The Torch) which he edited The journal, 'Al Hilal, popularised a new approach to religion It also set a new style in Urdu journalism which has not been surpassed yet

Maulana Azad s writings angered bigots who threatened to murder him and annoyed the British Government which disliked his crusade for freedom. The journal had to close down in 1915 because the Government forfeited its security and demanded a fresh sum of Rs 10 000 In a few months Maulana Azad brought out another journal Al Balagh That lasted only four months at the end of which his stay in Bengal was prohibited. Since earlier orders had banned his entry into Delhi, Punjab United Province Madras and Bombay he went to Ranchi in Bihar In a few months he was *interned there*

MAULANA ABUL KALAM AZAD

Coming out of internment Maulana Azad plunged into the Khilafat and non cooperation movements

Maulana Azad associated himself in 1921 with Mahatma Gandhi Temperamentally different their ideas were not often the same Yet Mahatma Gandhi esteemed the Maulana as one of his valued counsellors The association lasted till the assassination of the Mahatma when, with the agony of an orphaned

using ordinary calculation machines The Sesm is of much simpler design than the universal electronic comput r and it is simple to control as well It needs only two operators—an engineer and a technician

COSMIC SPEED ACHIEVED

It is quite possible that a rocket will be shortly fired to the moon or made to circle it as Soviet scientists have almost achieved the second cosmic speed of about seven miles a second which is necessary to overcome the pull of terrestrial gravity and emerge into the expanses of the universe

Prof Tigran Melkumov, a noted Soviet expert in motors writes in *Vestnik Vozdushnogo Flota* (Aviation News) that the fuel problem is a very serious question which is to be solved before cosmic flights can be effected He says that along with the use of solar energy which is quite possible outside the earth's atmosphere very promising is the employment of inter nuclear energy Probably the shortest way to solve the problem of the most economical (as regards weight) source of energy is to harness the thermo nuclear reaction

STUDY OF MILKY WAY SYSTEM

The detection of radio signals with a wave length of 21 centimeters has opened a new era in the study of the structure of the Milky Way system with its hundred thousand million stars and the similar galaxies in space

The signals are emitted by atoms of hydrogen and show that tenuous hydrogen clouds fill much of the space between the stars according to a Smithsonian Institution report by Dr Bart J Bok of the Harvard College Observatory

The 21 centimeter waves may be regarded as a kind of invisible light that obeys essentially the same rules as visible ultraviolet and infra red light and passes easily through obscuring material. The wave length is slightly lengthened when radiation comes from an object moving away from the observer and slightly shortened when it comes from an object moving toward the observer these changes are measured and used to determine the speeds of the atoms The direction from which the waves come reveals the structure of the galaxy and the speeds of the atoms reveal its rotation

PILLS THAT KEEP WARM

A pill that may increase resistance to cold is being tested at the Arctic Aeromedical Laboratory near Fairbanks Alaska According to a report in New York the pill contains glycine an amino-acid that causes the body to generate more heat than it can otherwise produce It is hoped the pill might enable men to stay alive longer in icy water and hasten the warming of a man who has been chilled to a critical point of exposure At the laboratory operated by the Air Force at Ladd Air Force Base volunteers are taking the pills with no evidence of ill effect If the tests are *successful the pills could be included in survi*val kits Glycine also may make possible a technique of heart surgery in which the heart can be chilled to the point where it stops for an hour or more without suffering damage According to scientists working at the Air Force laboratory the heart suffers ventricular fibrillation when its temperature is lowered to about 78 degrees Fahrenheit This is a loss of rhythmic beat which causes death. Hence, in heart surgery the organ can be chilled only enough to stop its beating for six or eight minutes Glycine in the blood stream may enable the heart to be chilled past this critical temperature Extensive research has been carried out at the laboratory with Negroes Eskimos and Whites to find out why some ethnic groups seem more resistant to cold than others Among Negroes who agreed to act as subjects in the experiments basal metabolism—that is their rate of energy production—fell more rapidly than it did in white men Similar studies of Eskimos produced no evidence that their bodies were better equipped for the cold than those of white men. The Eskimos ability to endure extremely low temperatures seems based on acquired skills and excellently adapted clothing and diet

NEW PLANET DISCOVERED

The Purple Mountain Observatory at Nanking has discovered a new planet *New China* news agency reported on December 8 1957

It is the sixth minor planet discovered by the observatory since 1955

The planet is said to be moving around the sun with an average radius somewhat less than twice the distance between the sun and earth

RUSSIA CREATES ARTIFICIAL QUAKE

Soviet scientists created an artificial earth quake by firing 1 000 tons of explosives 130 feet below ground in a remote area of the

PEOPLE IN THE NEWS

MAULANA ABUL KALAM AZAD

Maulana Abul Kalam Azad Minister for Education and Scientific Research passed away at New Delhi on February 22 1958, at 2 15 a m at his residence 4, King Edward Road New Delhi

Maulana Abul Kalam Azad was born on *November 11 1888 at Mecca of a Muslim* refugee father and an Arab lady In order to escape the wanton carnage let loose by the British in 1857 Azad s father Maulana Muhammad Khairuddin fled to Mecca In 1880 at the insistence of his followers he returned *to Bombay He however often* visited Mecca and it was in 1898 that he and his family moved to Calcutta and settled down there In 1905 Azad was *sent to the famous* Al Azhar University at Cairo for advanced studies in Arabic. He mastered Dar-e Nizami the most advanced course of studies in Arabic and Persian in four years instead of 14 He had a flair for writing poetry and journalism At 14 he was editing a journal in Urdu the *Voice of Truth*

Maulana Azad was elected President of the Congress when India restive for an agitation to overthrow foreign rule was dragged into World War I by the British Government He led the Congress for the longest and the most eventful period not only in the history of that national organisation but also of the country

The Ramgarh Congress, over which Maulana Azad presided was followed by individual satyagraha for which Mahatma Gandhi chose Acharya Vinoba Bhave as the first satyagrahi

Soon Quit India reverberated throughout the country and the echoes of that rallying cry died down only in September 1946 when Mr Jawaharlal Nehru formed an interim Government in New Delhi

In 1946 Maulana Azad laid down the office of Congress President as participation in national struggles had told on his health

In 1912 Maulana Azad shocked orthodox Muslims with his writings in Al Hilal (The Torch) which he edited The journal 'Al Hilal, popularised a new approach to religion It also set a new style in Urdu journalism which has not been surpassed yet

Maulana Azad s writings angered bigots *who threaten*ed to murder him and annoyed the British Government which disliked his crusade for freedom The journal had *to close* down in 1915 because the *Government* forfeited its security and demanded a fresh sum of Rs 10 000 In a few months Maulana Azad brought out another journal Al Balagh *That lasted only four months at the end of* which his stay in Bengal was prohibited Since earlier orders had banned his entry into Delhi Punjab United *Province Madras and Bombay,* he went to Ranchi in Bihar In a few months he was interned there

MAULANA ABUL KALAM AZAD

Coming out of internment Maulana Azad plunged into the Khilafat and non cooperation movements

Maulana Azad associated himself in 1921 with Mahatma Gandhi Temperamentally different their ideas were not often the same Yet Mahatma Gandhi esteemed the Maulana as one of his valued counsellors The association lasted till the assassination of the Mahatma when with the agony of an orphaned

nationalist, the Maulana cried that the blood of Gandhiji lay on the hands of every Indian.

Maulana Azad was the youngest Congress President when that national organisation chose him for that position in 1923 He was only 35 then

Since 1923 Maulana Azad had been among the few leaders who shaped the policy and programme of the Congress His uncompromising nationalism angered communalists among Muslims There was an agitation towards the end of 1938 among fanatics in Calcutta to remove Maulan Azad from the Imamat during 'Id prayers

As Congress President Maulana Azad carried on negotiations with the Cripps Mission which failed With the Mahatma and other leaders of the Congress he was arrested on August 9 1942 and detained His wife died in Calcutta while he was detained in Ahmednagar Fort.

While under detention he refused to receive relatives because of the peculiar attitude taken by the authorities He also expressed disgust at the reported attempts of his well wishers to secure his release on grounds of failing health Have the same heart as I have he told his nephew who wanted to see him while in detention. That was the indomitable spirit of the man who loved the good things of life liked nothing better than writing and reading and yet was drawn into the political struggle by his love for freedom

After his release with other eminent Congressmen in June 1945 he headed the Congress delegation to the Simla Conference which the then Viceroy Lord Wavell, called That futile conference was followed by the Cabinet Mission. Again as Congress President he represented that organisation at the talks

The series of negotiations that followed made the establishment of an interim Central Government possible Maulana Azad laid down office as Congress President towards the end of 1946

Early in January 1947, he joined the Central Government and was given the portfolio of Education which he held till the time of his death

In the last General Election, Maulana Azad was returned by an overwhelming majority from Gurgaon constituency in the Punjab.

Maulana Azad explained his views on the eudcational problems in the country soon after he was put in charge of education 11 years ago. He declared The reconstruction of our educational system as the foundation of a new national life was the task before the country

* * *

MR LEOPOLD FIGL

Dr Figl Foreign Minister of Austria, paid a seven day visit to India from March 4 to 11

Born on October 2 1902, in Rust, Lower Austria, in one of Austria s oldest peasant families Mr Figl graduated at the Vienna College of Agriculture in 1930 He joined the Lower Austrian section of the Austrian Peasants League in 1927 Later in recognition of his success as executive speaker and political writer Mr Figl was appointed secretary deputy director, and eventually director of the Lower Austrian Peasants League

In November 1934 Mr Figl was nominated to the Federal Board of Economy and one year later appointed Director of the All Austrian Peasants League. Immediately after the forcible annexation of Austria in 1938 he was detained in the Dachau concentration camp Moved from camp to camp for over five years he passed through an ordeal of torment and illtreatment This time he was repeatedly brought to the verge of severe illness and escaped death only by the unfailing aid of numerous friends he made in the concentration camps

Eventually released from imprisonment in May 1943 Mr Figl engaged in preparatory efforts for the underground reorganization of the Peasants League In October 1944 he was re arrested by the Gestapo and accused of high treason. He was admitted to the notorious camp of Mauthausen and his trial for high treason was already scheduled for spring 1945 in Vienna when he was liberated by the Allied troops on April 6

While fighting was still in progress, on April 12 1945, Mr Figl was called from his provisional shelter to rebuild the organization of the Austrian farmers Within a few weeks he was able to revive and reshape the Austrian Peasants League from utter disintegration into a functioning body which has today become one of the main pillars of the new Austrian Government. In May, 1945 the leader of the newly established Austrian Peasants League was asked by the first postwar Chancellor Karl Renner,

to take over the duties of Secretary of State in the Political Department of the provisional Austrian Government When the civil administration of Lower Austria was delegated to the Federal Government in the course of May 1945 Mr Figl was also nominated Governor of Lower Austria with the special assignment to reconstruct the administration of his province.

Already during the Nazi occupation Mr Figl with a few friends had laid the foundation for a conservative party the Austrian People s Party In the first general elections after World War II the new party scored 50 per cent of the total vote and thus became Austria s strongest single party Mr Figl at that time chairman of the People s Party entered the office of Chancellor in December 1945

The following seven years in which Mr Figl held office were marked by the stabilization of Austria s political as well as economic affairs Irrespective of continued four Power occupation Mr Figl s Government succeeded in rebuilding the country

In his capacity as Chancellor Mr Figl made State visits to Switzerland in 1948 and to the capitals of the Scandinavian countries in 1952 Also in 1952 he accepted an invitation by the Governments of the U S A the U K. and France to pay official visits to London, Washington and Paris In 1953, he visited Belgium and Luxemburg Mean while he had skillfully been acting as Austria s spokesman at the London Foreign Ministers Conference in 1947

A few months after his replacement in the office of Chancellor by Julius Raab, in November 1953 Mr Figl was appointed Federal Minister of Foreign Affairs In his new assignment he distinguished himself by his courageous and resourceful action at the 1954 Four Power conference in Berlin In 1955 he was valuable as a member of the Austrian Government delegation conducting the final State Treaty negotations in Moscow His activities in 1956 were marked by his participation in the Austrian Government delegation to Rome on the occasion of the 80th birthday anniversary of Pontiff Pius XII by his important mission in Strasbourg in connection with Austria s accession to the Cuncil of Europe and by his impressive representation of Austria as a newly admitted member at the Eleventh U N General Assembly in New York. But the actual climax of his career was the signing of the Austrian State Treaty in Vienna on May 15 1955

Mr Figl is undoubtedly the Austrian statesman of the post war period who is very popular abroad With untiring energy and healthy optimism he tackled his difficult task in 1945 His extensive knowledge of economic affairs proved as valuable as his tenacity in negotiations

Mr Figl is an enthusiastic hunter and an excellent marksman

—o—

POLISH GOVERNMENT SCHOLARSHIPS

The Government of Poland have offered two scholarships for study/training of the application of Folk Art patterns to Cottage and Small Scale Industries in Poland during 1958 59

The value of each scholarship which is tenable for one academic year is approximately Rs 240/ p m with free boarding and cost of second class passage both ways

For one of the scholarships a candidate should possess at least a good degree or equivalent diploma in Art or painting from a recognized institution with at least two years practical experience after diploma/degree

For the other scholarship a candidate *must* be an artist of some standing and should possess a good knowledge of English or working knowledge of French or German and at least five years experience in the line Candidates for both the awards should not be more than 35 years of age on April 30 1958

Application forms and further details can be had from the Union Ministry of *Education* and Scientific Research Scholarship Division (Section S 18) New Delhi

The last date for receipt of applications in the Ministry is April 30 1958

(*Continued from page 316*)

Uzbek desert Moscow Radio said on December 22 1957

The explosion, made during a series of experiments in mining research formed a crater with a diameter of some 200 yards It will be used as a reservoir

Moscow Radio said the Uzbek desert was chosen to avoid damage to life and property The blast was recorded at the Tashkent seismological station

Foreign Events

U S launches Her First Earth Satellite

The first U S artificial earth satellite, called *Explorer* or *Alpha* 1958 was successfully launched at Cape Canaveral (Florida) at 10 48 p m local time on Jan 31 (3 48 a m G M T on February 1) I began orbiting the earth seven minutes later at a speed of 18 000 miles an hour

The pencil shaped vehicle containing the satellite was an adapted *Jupiter C* rocket consisting of (i) a modified *Redstone* rocket—a guided missile developed by the U S Army and (ii) a cluster of rockets—scaled down versions of the *Sergeant* an Army tactical missile—superimposed on the cone of *Redstone* working in three stages and described as the high speed assembly The last of these rockets (the third stage of the high speed assembly) remained attached to the satellite and moved with it through outer space

The *Explorer* satellite was officially described as a bullet shaped tube about 80 inches long six inches wide and weighing 30 8 lb including 12 67 lb of the final stage rocket and 10 lb of radio transmitters and instruments to measure outer and inner temperatures cosmic rays and the effect of meteoric dust on the outer surface of the satellite

The orbit of *Explorer* was described as an elongated ellipse ("severely egg shaped") crossing the Equator at an angle of approximately 34 degrees with a maximum height (apogee) of 1 800 miles and a minimum height (perigee) of 187 miles these were revised figures issued on February 2 on the basis of observations by American scientists, the original estimates having been an apogee of 1,700 miles and a perigee of 200 miles

The satellite s course is east to-west thus enabling it to benefit from an added velocity of 1 000 feet per second because of the rotational speed of the Earth It completes one full orbit in 118 minutes—a revised estimate on the figure of 114 minutes originally announced Because of its smaller inclination to the Equator as compared with the Soviet Sputniks the Explorer s orbit is confined to a band of about 2 000 miles on either side of the Equator—between 40 deg North and 40 deg South At its northernmost point of orbit it passes over the southern tip of Spain, and at its southernmost point over the southern tip of Africa thus it does not pass over Britain and the northern and central parts of Continental Europe, nor over any part of the Soviet Union

Comparative data of the American Explorer and the two Russian Sputniks are given below

	Explorer	*Sputnik I*	*Sputnik II*
Weight	30 8 lb	184 lb	1 118 lb
Shape	Cylindrical	Spherical	Conical
Dimensions	80 in. long; 6 in diameter	22.8 inches diameter	19 ft long 4 ft diameter
Orbit time	118 minutes	96 2 minutes	103 7 minutes
Speed	18 000 m p h	18 000 m p h	18 000 m p h.
Maximum altitude	1 800 miles	560 miles	1 056 miles
Minimum altitude	187 miles	145 miles	104 miles
Angle to Equatorial plane	34 degrees	65 degrees	65 degrees
Date launched	January 31, 1958	Oct 4 1957	November 3 1957
Payload	10 lb. of instruments	Instruments	Dog and instruments

The *Explorer* earth satellite was equipped with two radio transmitters, one working at 60 milliwatts on a frequency of 108 megacycles and the other transmitting at 10 milliwatts on a frequency of 108 3 megacycles

Explorer is basically the realization of a satellite project—known as Orbiter —which was planned in 1954 by a group of U S scientists together with Dr Wernher von Braun a German born scientist and an authority on rocketry

At a press conference on February 2 Dr Von Braun expressed high satisfaction at the launching of the *Explorer* which however, was ' a rival only in spirit to the two Soviet satellites he added that the rate at which the Russians were working on space and missile programmes was frightening and expressed his conviction that it would take the U S A five years to catch up with the Russians Dr Von Braun also said that the first stage of the Jupiter C (i e the Redstone rocket) had been fuelled with an 'exotic preparation although no details were given the fuel was reported to be a liquid boron compound called hidyne (The smaller rockets in the high speed assembly were powered by a solid fuel)

Unlike Project Vanguard which is the responsibility of the U S Navy the *Explorer* project was carried out by the U S Army authorities

* * *

General Elections and New Government in Thailand

General elections were held in Siam on December 15 1957 for a new National Assembly of 283 members of whom 160 were directly elected and 123 nominated by King Phumiphon Aduldet The elected (first-category) seats were contested by 183 candidates representing 19 political parties while the nominated (second category) members consisted for the greater part of army officers nominated by the King on the advice of Field Marshal Sarit Thanarat the Supreme Commander of the armed forces

The elections were held under the surveillance of the Army authorities who had previously declared that they would be free and unfettered and that no corrupt practices of any description would be tolerated No obstacles were placed in the way of any of political parties and the elections took place throughout the country in a quiet and orderly atmosphere Unlike the elections of February 1957 no allegations of corrupt or illegal practices were brought against any party or group Of the electorate of 9 859 000 registered voters (out of a total population of about 23 000 000), some 35 per cent went to the poll—a percentage about equal to that in previous elections

Of the 160 elected seats 45 were won by the Unionist (*Sahaboom*) party, a moderate group comprising right centre and left centre elements founded in July 1957 and led by Dr Sukich Nimmanhemin, Minister of Economic Affairs in Mr Pote Sarasin s caretaker administration The Democratic (*Prachatipat*) party a right wing liberal group led by Nai Phuang Aphaiwongse won 39 seats, while 15 seats went to various left wing groups and 61 seats to Independent candidates—the last including many members of the *Seri Manangasila* party formerly led by Field Marshal Pibul Songgram

As none of the parties obtained an overall majority, Field Marshal Sarit Thanarat entered into dicussions with military and political leaders which resulted on December 1957 in the formation of a National Socialist party comprising the 123 nominated members of the Assembly the 45 Unionist members and about 40 members of the *Seri Manangasila* who had been elected as Independents— the New party thereby obtaining an overall majority of about 210 seats in the National Assembly The National Socialist party thus represented a coalition between the Army moderate political opinion of the right centre and the left centre and followers of Field Marshal Pibul Songgram who had been overthrown by Field Marshal Sarit Thanarat in the bloodless *coup d'etat* of September 16 17, 1957 Field Marshal Sarit Thanarat became leader of the new party but declined to accept the Premiership

A new Government was formed on January 3 1958 with General Thanom Kittikachorn as Prime Minister and Minister of Defence

In a press statement on taking office as Prime Minister General Thanom Kittikachorn emphasized that his Government remained 100 per cent anti communist and would continue to co-operate fully with the West There would be no change in Siam s foreign policy which would remain based on the U N Charter and the SEATO Pact General Thanom Kittikachorn added that his Government would take all necessary measures to halt Chinese Communist infiltration would co-operate with Malya in suppressing Communism in South East Asia and desired co-operation with other Aisan countries which were not members of SEATO such as India Burma, Ceylon and Indonesia ****

HOME AFFAIRS

Reshuffle in Union Cabinet

Consequent on the resignation of Mr T T Krishnamachari and the death of Maulana Abul Kalam Azad the reshuffle in Union Cabinet was officially announced on March 13 1958 Mr Morarji Desai has been allotted the Finance Portfolio while Mr Lal Bahadur Shastri has become Minister for Commerce and Industry

The new member of the Cabinet is Mr Hafiz Mohammad Ibrahim Finance Minister of Uttar Pradesh who takes over Irrigation and Power from Mr S K Patil on the latter's elevation to the bigger Ministry of Transport and Communications in place of Mr Lal Bahadur Shastri

Included in the Council of Ministers are also Mr B Gopala Reddy Finance Minister of Andhra Pradesh, who becomes Minister for Economic Affairs and four new Deputy Ministers Mrs Tarakeshwari Sinha (Economic Affairs) Mr S V Ramaswamy (Railways) Mr Ahmed Mohiuddin (Civil Aviation) and Mr P S Naskar (Rehabilitation)

While other existing members of the Cabinet retain their respective portfolios the Union Ministry of Education has been down graded and bifurcated and in addition to Dr K L Shrimali who continues as the Minister of State of Education Mr Humayun Kabir until now the Minister of Civil Aviation returns to his old Ministry where he worked as the Secretary for a number of years as the Minister of State in charge of Scientific Research and Culture

There are three women in the Council of Ministers all Deputy Ministers

Members Of The Cabinet

The following is the full picture of the reshuffled Cabinet.

Mr Nehru—Prime Minister and Minister of External Affairs and also in charge of the Department of Atomic Energy

Mr Govind Ballabh Pant—Minister of Home Affairs

Mr Morarji Desai—Minister of Finance

Mr Jagjivan Ram—Minister of Railways

Mr Gulzari Lal Nanda—Minister of Labour, Employment and Planning

Mr Lal Bahadur Shastri—Minister of Commerce and Industry

Sardar Swaran Singh—Minister of Steel Mines and Fuel

Mr K C Reddy—Minister of Works Housing and Supply

Mr Ajit Prasad Jain—Minister of Food and Agriculture

Mr V K Krishna Menon—Minister of Defence

Mr S K Patil Minister of Transport and Communications

Hafiz Mohammad Ibrahim—Minister of Irrigation and Power

The four new Deputy Ministers have been alloted the following portfolios

Mr S V Ramaswamy—Railways

Mr Ahmed Mohiuddin—Civil Aviation

Mrs Tarakeshwari Sinha—Economic Affairs

Mr P.S Naskar—Rehabilitation

Ministers Of State

Mr S N Sinha—Minister of Parliamentary Affairs

Dr B V Keskar—Minister of Information and Broadcasting

Mr D P Karmarkar—Minister of Health.

Dr P.S Deshmukh—Minister of State in the Ministry of Food and Agriculture

Mr K D Malaviya—Minister of State in the Ministry of Steel Mines and fuel

Mr Mehr Chand Khanna—Ministry of Rehabilitation

Mr Nityanand Kanungo—Minister of State in the Ministry of Commerce and Industry

Mr Raj Bahadur—Minister of State in the Ministry of Transport and Communications

Mr B N Datar—Minister of State in the Ministry of Home Affairs

Mr Manubhai Shah—Minister of State in the Ministry of Commerce and Industry

Mr S K Dey—Minister of Community Development

Dr K L. Shrimali—Minister of Education

Mr A K Sen—Minister of Law

Mr Humayun Kabir—Minister of Scientific Research and Culture

Mr B Gopala Reddy—Minister of Economic Affairs

Deputy Ministers

Mr S S Majithia—Deputy Minister of Defence

Mr Abid Ali—Deputy Minister of Labour

Mr Anil Kumar Chanda—Deputy Minister for Works Housing and Supply

Mr M V Krishnappa—Deputy Minister of Food and Agriculture

Mr Jai Sukh Lal Hathi—Deputy Minister of Irrigation and Power

Mr Satish Chandra—Deputy Minister of Commerce and Industry

Mr Shyam Nandan Mishra—Deputy Minister of Planning

Mr Bali Ram Bhagat—Deputy Minister of Finance

Dr Monomohan Das—Deputy Minister of Education and Scientific Research

Mr Shah Nawaz Khan—Deputy Minister of Railways

Mrs Lakshmi N Menon—Deputy Minister of External Affairs

Mr S V Ramaswamy—Deputy Minister of Railways

Mr Ahmed Mohiuddin—Deputy Minister of Civil Aviation

Mrs Tarkeshwari Sinha—Deputy Minister of Economic Affairs

Mr P.S Naskar—Deputy Minister of Rehabilitation

Mr A M Thomas—Deputy Minister for Food

Mrs Violet Alva—Deputy Minister for Home Affairs

Mr K Raghuramiah—Deputy Minister for Defence

Mr R N Hajarnavis—Deputy Minister of Law

* * *

Union Budget for 1958 59

he Prime Minister who was also holding the Finance portfolio presented the Central budget for 1958 59 to Parliament on February 28 1958 —

BUDGET AT A GLANCE

(*In lakhs of rupees*)

		Budget 1957 58	Revised 1957 58	Budget 1958-59
	Total Revenue	708 03	724 63	763 16) 5 83*)
Effect of budget proposals	Total Expenditure	672,29	719 58	796 01
	Surplus (+) Deficit (—)	+35 73	+5 05	—27 02

Tax Proposals for 1958-59

The Gift Tax This will fill a gap in the scheme of direct taxation and will not only make evasion or avoidance difficult but also spread the tax burdens more equitably

The Tax will be levied on the donor on the valu of all gifts made by him during a year but for the purpose of determining a rate of duty the gifts made during the four years preceding the year will be aggregated. Such aggregation will be made only in respect of gifts made after the date this tax come into force Gifts upto a total value of Rs 10 000 in any one year will be exempt If the value of gifts made during any year exceeds this sum only the excess will be subjected to tax The basic exemption will be reduced to Rs. 5 000 if gifts to any one individual donee during a year exceed Rs 3 000

Some other important exemptions are

(a) gifts to Central and State Governments, Local Authorities and charitable institutions

(b) gifts to female dependents on the occasion of marriage upto Rs 10 000 in each case

(c) gifts to one s wife upto a total limit of Rs 1 lakh

(d) gifts to dependants of policies of insurance upto Rs 10 000 for each.

Rates of the Tax Same as for Estate Duty except that the first slab of Rs 50 000 will not be exempt from the tax The rates

range from 4% on the first slab to 40% on gifts over Rs 50 lakhs

The yield from the Gifts Tax is estimated at Rs 3 crores

Amendments to Estate Duty Act

The important changes proposed are

(a) The exemption limit will be reduced from Rs 1 00 000 to Rs 50,000

(b) Only one half of the probate duty or court fees paid on succession certificates will be allowed as a deduction from estate duty instead of the full amount as at present

(c) Gifts other than those for charitable purposes made within a period of two years prior to death are now subjected to estate duty It is proposed to increase this period to five years as recomended by the Taxation Enquiry Commission Gifts on which gift tax has been paid will not be taken into account

(d) The value of co parcenery interest in Hindu Undivided Families will be taxed at the rate applicable to the value of the estate of the branch of the family concerned

These changes will increase the revenue by Rs 50 lakhs which will accrue wholly to the States

Excess Dividend Super Tax

These are payable by Section 23 A Companies At present there are 3 slabs It is now proposed to fix the tax rates only in two slabs 10 per cent on the slab of dividends over 6 per cent of capital and 20 per cent on the slab over 10 per cent of capital

It is not possible to estimate the loss of revenue in this proposal but it is likely to be very small

Development Rebate

While the present rate of 25 per cent is adequate for new plant and machinery in general some further concession is necessary for the shipping industry The rate of development rebate for ships will be increased to 40 per cent Simultaneously, the conditions for the grant of development rebate will be tightened.

Income Tax Exemption

Exemption from income tax of payment made to employees for leave passages is now granted only if the payments are made under certain rules framed by Government These rules are proposed to be withdrawn because of administrative reasons

Wealth Tax

A foreign citizen will be exempt from payment of the Wealth Tax on his foreign wealth even though he may be resident or ordinarily resident in India

Excise Duties

The rate of duty on cement is to be increased from Rs 20 per ton to Rs 24 per ton Simultaneously the surcharge at present levied by the State Corporation will be withdrawn

The additional revenue from this is expected to be Rs 2 24 crores This amount will be utilised for road development

For powerlooms producing cotton textiles, it is proposed that the concession of paying duty at compounded rates should no longer be available to establishments having more than 100 looms Simultaneously, the compounded rates applicable to units having 25 to 100 powerlooms are being suitably enhanced in two stages

This will bring an additional revenue of Rs 83 lakhs

The rate of duty on vegetable products is being lowered for the first 3 000 tons cleared by each factory This will give substantial relief to the small producers

This reduction in duty will involve a loss of Rs 24 lakhs

Custom Duties

The only change of any significance is the introduction of the alternative *ad valorem* rate of duty in respect of expensive varieties of artificial silk yarn like nylon perlon etc. So far as the other yarns, such as Viscose are concerned the rate of duty remains unchanged The financial effect of these changes will be negligible

The taxation proposals will yield a total sum of Rs 6 57 crores, of which Rs 50 lakhs will accrue to the States The reduction in the excise duty on vegetable products will leave the net additional revenue at Rs 5 83 crores. This will leave a final budget deficit of Rs 27 02 crores which will be left uncovered.

PARLIAMENTARY AFFAIRS

Prime Minister's Reply to the Debate on the President's Address

Shri Nehru replying on February 18 to the 4-day debate on the address in Lok Sabha stated that both the economic and food situations in the country had considerably improved during the past one year Inflationary pressures had abated and the rate of drawal of foreign exchange reserves had declined Both in regard to the credit policy and the import policy the reins were being held fairly tightly The quantum of available external assistance was also much better

Referring to the Plan Shri Nehru said that the present position was considerably more hopeful than it was a year ago Referring to criticism that the public sector was not doing well Shri Nehru said that 'It is the public sector that is being built up in a big way All these steel plants etc are the big foundations of the public sector It is the burden of that we have to carry today The tremendous amount of imports that are coming in are all for the public sector

Referring to foreign affairs the Prime Minister said that any criticism that India was unaligned and uncommitted and did not fall in line with other policies took for granted that really the central policy must emerge from Europe or America or Moscow and that all other countries could not develop their own point of view A country develops its world view or its political or international view because of not only factors of history or race but because of geography India has to take world view from Delhi

Shri Pant's Speech in Rajya Sabha

Two-day debate on the President's Address in the Rajya Sabha concluded on February 17 with the Home Minister Sri Pant's reply who stressed that position about Kashmir had now been fully clarified Kashmir like any other State was part of India and would continue to be so This was the declaration as well as the determination of the people of Kashmir and the rest of India. Shri Pant said that the services in Kashmir would be integrated with the rest of India and the Comptroller and Auditor General over the accounts of Jammu and Kashmir

Later the Motion was unanimously adopted by the Rajya Sabha and the Lok Sabha

The Railway Budget Presented to Parliament

The Railway Budget for the next financial year was presented to Parliament on February 17 by the Railway Minister Shri Jagjivan Ram It shows a next surpuls of more than 27 crores of rupees This is about six crores more than the revised surplus for the current year The Budget proposes no changes in the existing fares and freights The Railway's contribution to the general revenue will be over 49 crores during 1958-59 about five crores more than the revised estimates for this year

The Railway Minister said the capacity for producing railway stock within the country had shown further improvement The import of steam locomotives has now been stopped except for the few required for narrow gauge lines Chittranjan Factory was expected to turn out 168 locomotives during the current year 12 more than the production last year About accidents he said, technical improvements were being progressively introduced so as to mitigate the incidence of the human elements.

Discussion on the Chagla Report

Both the Houses of Parliament held discussion on the Chagla Report Shri Nehru who opened the discussion on February 19 in the Lok Sabha announced the Government had accepted the Chagla Commission's findings that the transaction resulting in the purchases of shares of all companies by Life Insurance Corporation was not entered into in accordance with the business principles and was also opposed to propriety on several grounds He said Government proposed to initiate appropriate on proceedings on the basis of the findings of the Commission in respect of the officers responsible for putting through the transaction About the principles recommended by the Commission for adoption by Government and the Life Insur-

ance Corporation the Prime Minister said these would be examined carefully

Replying to the debate which lasted about nine hours the Prime Minister said on February 20 that Government proposed to draft the policy governing investments by the life Insurance Corporation and place it before the House The Prime Minister described as attractive the idea of buying shares in those manufacturing concerns which were doing work for the Five-Year Plan From the positive view it was good to get more and more control over them progressively Later the Lok Sabha adopted the Prime Minister s motion embodying Government s decision on the operative part of the Chagla Commission Report

The Rajya Sabha also adopted on February 21 a motion seeking approval of Government s approach to the Ghagla Commission Report after a seven hour debate on that day Initiating debate the Home Minister Shri G B Pant said so far as the persons connected with the transactions were concerned Government had decided that necessary proceedings should be initiated against them The Home Minister said that the enquiry was the first of its kind held in India and had demonstrated in an unmistakable way the supremacy of Parliament The debate concluded after the Home Minister s reply

Import Of Foodgrains

The Government of India had made arrangements for the import of 1 6 million tons of wheat in the first half of 1958 the Deputy Minister of Food Shri A M Thomas disclosed in the Lok Sabha on February 21 He was replying to the points raised by Members regarding his Ministery during the discussion on the supplementary demands for grant for the current financial year Shri Thomas said that at present the reserve stock of food grains with the Central and State Governments was 12 48 lakh tons—9 25 lakh tons of wheat and 3.23 lakh tons of rice

Sanskrit Commission s Report

A summary of the Sanskrit Commission s report was placed on the table of the Rajya Sabha on February 20 by Dr Shrimali Minister of State in the Ministry of Education He said Government were examining the Commission s recommendations

The Sanskrit Commission in its report to the Government had recommended the compulsory teaching of Sanskrit in all secondary schools and had suggested a modification of th three language formula for this purpose. About the system of teaching the Commission says the traditional *pathshala* system should be preserved and revitalised and considers it premature to integrate it just now with the university system. The Commission has recommended creation of Sanskrit universities in different areas to upgrade the traditional system of Sanskrit education In its general recommendations the Commission says that Sanskrit should be declared an additional official language

Bills Passed In Rajya Sabha

The Rajya Sabha on February 18 passed an official bill to extend for another six years Government s powers for requisitioning and acquisition of immovable property It also passed on February 19 another official bill to amend the Penal Code the Prevention of Corruption Act and the Criminal Law Amendment Act Its object is to tighten up the law dealing with corruption The measure has already been passed by the Lok Sabha

Debate On The Railway Budget

The debate on the Railway budget ended in the Rajya Sabha on February 26 1958. Replying to the debate the Railway Minister Shri Jagjiwan Ram referred to the occurrence of accidents and said in most cases these had resulted from human failure but the railway worker was not to be blamed Sometimes in spite of best precautions accidents did occur The Railway would however continue to try their best to eliminate the chances of accidents.

The Minister said the recommendations of the Freight Structure Enquiry Committee were very important and intricate and were being examined Government s decision would soon be brought to the notice of the House

The debate in the Lok Sabha on the Railway Budget concluded on March 3 The Railway Minister replying to a general discussion on Railway Budget said that the Railway would pursue their policy of having one united federation for all railwaymen Referring to railway accidents he said that reports showed that they were not due to defective training of the staff, nor to any defect in the engines

Merchant Shipping Bill

The Lok Sabha accepted on February 25 an official motion to refer the Merchant Shipping Bill to a Joint Committee of Parliament The Bill seeks to revise and Consolidate all laws in force relating to merchant

Shippping whether passed by British Parliament or the Indian Legislature

The Rajya Sabha also agreed on February 27 with the Lok Sabha s recommendations that the Merchant Shipping Bill should be referred to a Joint Select Committee

The Refugee Problem

Rajya Sabha began on March 3 a three day debate on the General Budget Intervening in the debate on March 4 Shri M C Khanna Rehabilitation Minister gave an assurance that he would see that the problem of displaced persons in West Bengal was solved and people rehabilitated before the end of the Second Plan Shri Khanna said no other country had done so much for refugees with its own resources More than 300 crores of rupees had been spent on them Out of 30 crores provided in the new year s budget 23 crores was for the eastern region Government was spending up to 125 rupees per family every month on the three lakhs of displaced persons in camps on relief alone the daily expenditure was more than two lakhs of rupees

Shri Khanna said there had been no two way traffic between East and West Bengal In fact some of the Muslims who had gone away had returned to India and had been fully rehabilitated India could be proud that her minorities were living with dignity security and honour The same could not be said about the minorities in East Pakistan

Railway Appropriation Bill

The Railway Minister Shri Jagjiwan Ram introduced in the Lok Sabha on March 7 an Appropriation Bill which seeks to provide for the appropriation out of the Consolidated Fund of India of Rs 15 04 crores to meet the supplementary expenditure of the Railways for the current financial year Practically the whole of the amouut was voted by the House on March 4 during the debate on the Supplementary Demands

First Report Of The University Grants Commission

The first report of the University Grants Commission was presented to the Lok Sabha on March 3 1958 The report deals with the period December 1953 to March 1957

Dealing with the higher education in the country the Report says that the need of the day is consolidation rather than expansion An attempt has to be made to secure a right balance between the humanities the social and the natural sciences and the professional and technological courses But the primary concern at present is the improvement of standard and facilities

The report says that the average direct expenditure per university student in India is about Rs 500 a year whereas in Britain and United States it is more than Rs 5000 Only about 2.2 per cent of the University age group students (estimated at 10 per cent of the national population) are on the rolls of Indian University

The report shows that the Commission has given the highest priority to the improvement of the teachers salaries both at the university level and in the affiliated colleges So far 14 State Universities have accepted the scales of pay recommended by the Commission About students welfare the Commission says it has given thought to the problem of indiscipline among students and has undertaken a number of steps to improve the position.

Shri Nehru s Reply To Budget Debate in Rajya Sabha

Replying to the four day debate on the General Budget in the Rajya Sabha on March 11 the Prime Minister Mr Nehru said that the future of Five Year Plan of our finances in fact almost everything that we hope to achieve will depend on how much more food we can produce It is going to be a hard struggle but the country has taken a hard and difficult job

Shri Nehru said that the period between 1961 and 1963 would be a difficult one At that time, the repayment of foreign loans would reach its peak. The highest repayment Rs 123 crores would be in 1961 62 and thereafter repayment would taper off The Prime Minister said Government had kept in view the question of repayment at every stage He could not immediately say how these heavy payments would be arranged A good deal would depend on future food imports and production of iron and steel in the country—two main items which consume a lot of foreign exchange

The Prime Minister said there was now a widerspread sense of urgency among the State Governments and the Community Project areas and he had no doubt that this would produce results Their efforts were designed to increase per acre yield by concentrating on areas under community projects and on irrigated areas or those where rainfall was abundant Shri Nehru said as a result of the population increase the country had to provide for five million extra mouths every year He

(C

APPOINTMENTS, VISITORS, ETC THIS MONTH

Vallathol Narayana Menon (79) Poet Laureate of Kerala died in Ernakulam on March 13

(*Continued from page 3 7*)

stressed the need for restricting population growth and said this had become a question of crucial importance

About complaints of heavy taxation Shri Nehru said there could be no escape from it but it was being spread out as far as possible He did not agree that the present situation did not offer enough incentive for people to invest India s problem he said was unique it could not be solved by what he called the normal methods of free enterpri e He said free enterprise would not set up four huge steel plants and then wait for years for profit to come In fact several private enterprises in India were carrying on very much by public help

The Railways Appropriation Bill

The Lok Sabha passed on March 12 the Railway Appropriation Bill containing the demands for grants of the new Railway Budget amounting to more than a thousand crores of rupees

Speaking in the brief discussion on the Bill the Railway Minister Shri Jagjivan Ram said his Ministry was examining the feasibility of a group insurance scheme for railway employees out of their contributions from the Provident Fund

Adjournment of Rajya Sabha

The Rajya Sabha adjourned on March 14 for a month s recess when the biennial election for one third of the seats would be held Bidding farewell to the retiring members the Chairman Dr Radhakrishnan said 78 Members including the leader of the House and the leader of the Opposition were retiring While many of them would come back a few would not return and he wished to convey to them the hope that they would have other opportunities of serving the country in these exciting times when we were trying to build a new India

Associating himself with these sentiments the Prime Min ster said that whether some of the Members return or not it was good to remember that the field of service in the country was vast This was necessary as sometimes there was a tendency to think that the only effective way of serving the country was to be in the l gislatures It was the millions of people that carried the country forward not the few who were in the legislatures

Indian Union Cabinet reshuffled and portfolios redistributed

14 The dissolution of the marriage of the Shah of Iran and Queen Soraya on account of childlessness was announced in Teheran.

Mr Walter Nash New Zealand Prime Minister said in Hong Kong SEATO will have nothing whatsoever to do with the Kashmir dispute

'Bintang Timur', a Leftist daily of Jakarta, reported that illicit foreign arms dropped by parachute at Pakanbaru airfield just before Government forces occupied it were of American origin

The Government of India decided to establish an Atomic Energy Commission with full executive powers and modelled more or less on the lines of the Railway Board

Syed Amjad Ali Pakistan's Finance Minister told the Pakistan National Assembly in Karachi that Pakistan Government still 'does not recognise that Hyderabad State (now part of Andhra and Bombay) has acceded to India.

The Soviet Government declared it would not take part in the work of any United Nations disarmament body on which the Communist countries would be outnumbered by other nations

The Vice President, Dr Radhakrishnan left New Delhi by air for a month's tour of United States

IMPORTANT FOREIGN EVENTS IN 1957

(Continued From Last Month)

OCTOBER

1 Japan elected to U N Security Council

1 French Government headed by Premier Maurice Bourges Maunoury defeated

5 Soviet Union announced it had successfully launched the World s first earth satellite

7 Soviet Union said it had successfully exploded a mighty and new type of hydrogen bomb warhead

11 Mr H S Suhrawardy resigned as Prime Minister of Pakistan

12 Queen Elizabeth II and Prince Philip left for a 10 day visit to Canada and U S A

15 Yugoslavia recognised East Germany

15 United Kingdom transfered naval base of Trincomalee to Ceylon

18 New 13 man Cabinet headed by Mr I I Chundrigar Muslim League sworn in Pakistan

18 Agrarian-Socialist Coalition Government of Mr J Sukselainen defeated in Finland

19 Prince Karim 20 year old grandson of late Aga Khan installed as Aga Khan

22 Dr Konrad Adenauer elected to his third four year term as Chancellor of West Germany

26 Marshal Georgi Zhukov Soviet Miniter of Defence relieved of his post by Russian Parliament

NOVEMBER

2 President of China Mr Mao Tse tung flew to Moscow to participate with the numerous national Communist leaders in celebrating 40th anniversary of great October Revolution

Marshal Georgi Zhukov expelled from Communist Party Central Committee and Presidium

3 Russia launched its second earth satellite a half ton air condition sphere, carrying a live dog as its passenger

13 Death of Mr Antonin Zatopocky President of Czechoslovakia

14 Dr K I Singh Premier of Nepal resigned

26 The World Court rejected four of India s six preliminary objections against its jurisdiction to judge the Indo-Portuguese dispute over right of passage

President Eisenhower suffered the closure of a small artery in the brain which slightly impaired speech

DECEMBER

1 An attempt on the life of President Sukarno of Indonesia was made when hand grenades were thrown at a school party he attended

Indonesian Government intensified its anti Dutch campaign with a 24-hour strike against Dutch companies

5 Indonesia ordered Dutch nationals to leave the country and the Dutch Government was also asked to close down its consulates

6 America s first baby moon s launching attempt failed when the launching vehicle exploded in its stand

10 Mr Lester B Pearson of Canada received the 1957 Nobel Peace Prize

10 Jordan expelled two political attaches and the Secretary of the Syrian Embassy in Amman

11 Pakistan Muslim League led coalition Government headed by Mr I I Chundrigar resigned

Pakistan's 7 week old Government resigned President Mirza asked outgoing Prime Minister Mr I I Chundrigar to form a new Government

Mr Ali Jawad Prime Minister of Iraq resigned

The Indonesian Army was ordered confined to its barracks and men on leave were summoned back to their posts

13 A heavy earthquake struck West Iran, 1300 killed, thousands hurt

Russia sent a note to all U N countries stating that the danger of nuclear war had increased and action must be taken to improve relations between nations

The U N Political Committee adopted a resolution expressing the earnest hope that further negotiations and discussions would be undertaken aimed at applying the right of self determination to the people of Cyprus

Antara Indonesia news agency said in Jakarta that almost all Dutch businesses in Indonesia are now under State control

President Eisenhower arrived in Paris to attend NATO meeting

The U N General Assembly endorsed the peaceful coexistence resolution sponsored by India Sweden and Yugoslavia which was earlier adopted in its Political Committee

15 The Cabinet of Mr Abdul Wahab Mirjan new Iraqi Prime Minister was officially installed following sudden resignation of Mr Ali Jawad

In a cable to Mr Nehru President Eisenhower said that to halt nuclear weapon tests at this time without safeguarding assurances from Russia would increase rather than diminish the threat of aggression and war

16 Pakistan's seventh Government in 10 years assumed office with Republican leader Malik Feroze Khan Noon as the new Prime Minister

North Atlantic Treaty Organisation Conference opened in Paris

President Eisenhower called on the Atlantic Alliance to make 'heroic efforts' to build its military strength in the missiles race with Russia while the margin of power is still ours

Russia claimed that one of her latest fighter planes had reached a speed of over 2 000 kilometres (over 1242 miles) an hour

17 U.S Air Force successfully launched an Atlas inter continental ballistic missile (ICBM) on a limited range test

18 The 15 nation North Atlantic Alliance agreed in Paris to base American made nuclear missiles in Europe defying Russian threats and warnings

The U.S.A Defence Department testfired an intermediate range Jupiter rocket at Cape Canaveral (Florida) but it failed to launch

19 The NATO summit conference at Paris announced it was willing to promote 'any negotiations with Russia likely to lead to the implementation of the Western disarmament proposals'

Russia urged an East West 'summit' meeting to resolve world problems and rejected as inadequate the NATO plan for a Foreign Ministers Conference to break the disarmament deadlock

22 Sri Oliver Goonetilleke Ceylon Governor-General issued proclamation extending Ceylon's territorial waters upto six nautical miles and her fishing rights up to 100 miles

Mr Paul Henry Spaak Secretary General of Nato said in Paris that the Polish proposal to create a neutral de atomized zone in Central Europe was nonsense as it would demolish the Atlantic alliance

Dr Herbert Evatt Australian oppsition leader urged East Western summit talks until world peace was achieved

26 The British Prime Minister Mr Harold Mac millan won parliamentary approval for the establishment of U.S nuclear missiles on British soil

Mr Nikita Krushchev the Soviet Chief Communist Party chief challenged the West to sign a no-war agreement with Russia

Soviet planes made the first landings at the magnetic South Pole

Ceylon s worst floods in 50 years 100 people killed and 250 000 rendered homeless in three days

The Asian African Peoples Conference attended by some 400 delegates from about 42 countries opened in Cairo

Iraq withdrew her permanent representative to the United Nations Mr Hashim Jawad for voting against Turkey in the Cyprus debate

28 Yugoslavia and Yemen established diplomatic relations for the first time with the signing of freindship treaty and ' scientific technical cooperation pacts in Belgrade

The Indonesian Government was empowered by an order of the premier Dr Djuanda to conscript Dutch technicians to remain in Indonesia to help keep the nations troubled economic sy tem working

Mr M.A Qazilbash Pakistan Industries Minister announced in the National Assembly at Dacca that Pakistan was willing to refer the canal water dispute to arbitration

Mr Carlos Garira was sworn in as President of the Philippines at Manila

31 President Tito of Yugoslavia called for a 'summit conference on international problems at which every counry in the world would be represented

The Maltese Parliament passed a motion proposed by Mr Dom Mintoff the Prime Minister calling for severance of ties with Britain unless she provides alternative work for discharged dockyard workers

Dr Kwame Nkrumah (48) the Prime Minister of Ghana married Miss Fathia Helen Kitzk (25)

President Sukarno declared at Jakarta that Indonesia had reached a point of no return ' in her struggle for West Irian

Mr David Ben Gurion Israeli Prime Minister, submitted his resignation to President Ben Zvi

---

INTENATIONAL AFFAIRS

Chief Events

The year 1957 which dawned with International bitterness over Suez Canal and Hungarian issues ended with a new ray of hope for lessening tension between the big Western and Communist blocs During this year the world made very little progress towards peace, the major political problems still remain unsolved Middle East is still the cockpit of power politics Algerians are still fighting for their independence - Cypriots have achieved little progress in their struggle for self-determina tion Kashmir problem is still hanging fire in the Security Council, South Africa is adamant on its apartheid policy

and the Indonesians have taken astounding steps to liberate West New Guinea from Dutch domination. There have been minor troubles in some countries but they had little impact on international politics. The nuclear armament race is still hotly pursued and the U N sponsored Disarmament Committee has ended in fiasco without coming to any agreement. Britain has joined the hydrogen bomb club and France has announced to produce its own H bomb very soon. Russia has stolen a march over other nations in the field of science and nuclear weapon production.

America lost some international prestige by the spectacle presented by its government since the launching of the first Russian Sputnik by its highly publicised failure to throw a baby moon in an orbit round the world and by racial riots and Negro-baiting at Little Rock and Chicago. There have been anti-American riots in Taipeh and anti American demonstrations in Tokyo.

In Russia Khrushchev has become all powerful by eliminating or demoting his collegues who did not agree with his policy. There have been drastic changes in Soviet Presidium and some high ranking communist leaders including Malenkov, Molotov, Shepilov and Kaganovich were dismissed from Party leadership. Lately Marshal Zhukov has been replaced as Soviet Defence Minister by Marshal Malinovsky. Thus the Pro-Khrushchev group seized power in Russia and Khrushchev who once vigorously denounced Stalin is actively following Stalin's policy. Russia successfully tested Inter Continental Ballistic Missile.

The Middle-East

The Middle East Arab countries have been struggling to maintain their independence and neutrality. While there has been peace among Israel and Arab nations there has been interference by big powers in domestic affairs of these countries and there have also been internal conflicts and bitterness amongst the Arab nations themselves. The Eisenhower Doctrine was an open invitation [illegible]

governments of Arab countries. On March 9, Mr Eisenhower signed the document which gave him power to send military aid to any Arab country which asked for it. Though the aid was meant against spread of international communism, in disguise it was a plea to interfere in the internal affairs of Arab countries. Mr Eisenhower sent his emissary Mr James Richard to tour the Middle East countries in search of seekers of American aid. Mr Richard's mission to the Middle East was a failure and the Arab leaders unanimously rejected Mr Eisenhower's power vacuum in the Middle East theory but a rift has been created in the solidarity of Arab Nations. Saudi Arabia allowed America to keep its military base in the country and Jordan became more inclined towards America by accepting economic aid from her. On April 25 King Hussain of Jordan proclaimed martial law throughout his kingdom and dissolved all political parties after a severe cabinet crisis. The King also rejected diplomatic ties with Russia. America declared its readiness to give military aid to Jordan but Russia warned against any kind of interference in Jordan. Thus the crisis was averted for the time being. Syria and Egypt stood together and adhered to their policy of positive neutrality (Now formed federation) denounced Jordan for its pro-western inclination and declined to give financial aid to Jordan until the latter changed its policy. There was a radio and press propaganda in Cairo and Amman denouncing the policy and attitude of each other. Early in June Jordan banned all Egyptian papers in any language and expelled Egyptian diplomats from the country. By the interference of Saudi Arabia lull has been created in the press and radio propaganda war but there is still little hope for betterment of relations between Jordan and Egypt in the future. The Eisenhower Doctrine has served its ultimate purpose of dividing the Arab nations and creating a vacuum for Western Powers to step in at the right moment.

Britain has also had its share in interfering in the Middle East. Early in January British forces entered [illegible]

Aden territory from Yemeni raids The Imam of Yemen claimed Aden as a territory belonging to him while the British claimed Aden as their own protectorate Lately there have been direct talks in London between the British Prime Minister and the Yemini crown prince to settle the issue but Britain is not yielding to the Yemini claim nor is willing to leave Aden a stronghold of her influence in the Middle East

The British R. A. F also dropped bombs on Oman in July when the Imam of Oman revolted against the Sultan of Muscat. The revolt was subuded by the active military help of the British forces after a three week local war

France has been fighting its own war in Algeria and chasing the Algerian rebels within the borders of Tunisia Tunisia on July 25 had proclaimed itself a republic by deposing the Bey and electing Habib Bourguiba as its first president Tunisia had bought armaments from Britain and America for defence against French incursions on her territory France had protested to Britain and U S A against providing war weapons to Tunisia and alleged that the weapons were supplied to Algerian rebels by Tunisia Britain and America ignored the protests of France and justified by their selling armaments to a sovereign nation for her self defence

Tunisia had openly declared its sympathy with the Algerian struggle for independence but had denied any Military aid to the freedom fighters The U N Assembly has done nothing to solve the Algerian problem except passing a mild resolution sugges ting direct talks between Algerians and the French The French Government claimed Algeria as a part of France as in Northern region of Algeria the French population is in majority There has been little progress in solution of the Algerian problem and there seems to be no hope for its solution in the near future until the U N Assembly takes some active interest in it or France submits to the right of self-determination of the Algerians On October 1 the four month old French Government headed by M Maurice Bourges Maunoury fell on the Algerian issue A new government France s twenty fourth after the end of World War II, was formed by M Felix Gaillard on November 6 In its policy declaration the new government has also not shifted its stand on the Algerian issue

Early in October Middle East again became an area where a major war could flare up Provoked by Western powers Turkey deployed her armed forces on Turco-Syrian border and carried on provocative acts against Syria There was a Western sponsored fuss over trade pact between Syria and Russia Egypt sent her armed forces to Syria A state of emergency was declared by the Syrian army Turkey is a member of NATO and Baghdad Pact Turkey accused Syria of piling Russian arms on her borders with a view to attack Turkey The armies of both the countries were standing ready for attack On October 18 Russia warned that it would come to Syria s aid if she was attacked This warning made the Western attempt to create trouble in the Middle East fizzle out The result is that Russia again scored a moral victory winning the sympathy of Arab nations

Scientific Progress

On July 1 ten thousand scientists of 65 nations began to study the secrets of nature If not in political sphere the nations of opposite and different political ideologies joined in a common scientific aim to probe into secrets of nature, under the sea on the land and in the sky The combined study and efforts of these scientists during the International Geophysical Year (July 1 1957 to December 31 1958) will greatly enrich the knowledge of humanity

Soviet made Earth Satellite

On October 4 1957, the world witnessed an out standing event—the successful launching in the Soviet Union of the first man made earth s satellite

In the first approximation the satellite orbit was an ellipse one of whose focuses was in the centre of the Earth

The signals sent by the satellite s transmitters were in the form of telegraphic messages

A second artificial earth satellite was launched in the Soviet Union on November 3 1957

New Independent Nations—Ghana

The colony and protectorate of Gold Coast joined the concourse of free people as the State of Ghana on March 6 1957

The new nation brought together the peoples of the Gold Coast Colony Ashanti and the Northern Territories

Parliamentary Government

The State of Ghana is to have a Cabinet and parliamentary system of government of the same general type as exists in the United Kingdom and other independent Commonwealth countries

Under the new constitution Ghana is divided into the following five regions Eastern and Western Regions Trans Volta/Togoland Ashanti and the Northern Territories (including the northern section of Togoland with their present boundaries.

It was proposed to set up Regional Assemblies in each of the five regions

The elections envisaged by the Colonial Secretary were held on July 12 and 17 1956, and resulted in a victory for the Convention People s Party (CPP) led by Dr Nkrumah

Flag of Ghana

The Flag of Ghana consists of horizontal stripes of Red gold and green, with a five pointed black star in the centre of the gold stripe

Facts About Ghana

Area 91 843 sq miles
Climate : Tropical
Average max temperature 88°F
Average min temperature 72°F
Maximum annual rainfall 86 in
Minimum annual rainfall 30 in
Population mid 1954 (est) 4 548 000
Capital Accra (population 1948 census 136 000)
Other Towns Kumasi
(population, 1948 census, 78 500)
Sekondi Takoradi (population 1958 census 44 600)
Cape Coast (population, 1948 census 23,400)

Malaya

An agreement ending the 83 year period of British indirect rule in Malaya and also terminating direct British sovereignty over the former Straits Settlement of Malacca and Penang was signed in Kuala Lumpur on August 5 by Sir Donald Mac Gillivray (the High Commissioner) and the Rulers of the Malaya States, in the presence of the Chief Minister of the Federation (Tengku Abdul Rahman) and members of the Federation Cabinet. Constituting the 1st formality before the achievement of Malaya independence within the British Commonwealth it revoked all previous agreements between Britain and Malaya and came into force on Medeka Day (i.e Independence Day) Aug 31, 1957

The Malayan Parliament The Federation Parliament (*Majlis*) would consist of a Senate (Dewan Nagara) and a House of Representatives (Dewan Ra ayat)

Language Malay would be the official language of the Federation, English would also remain an official language for 10 years after independence

Religion The Constitution laid down that Islam would be the official religion of Malaya

Tunisia

The Tunisian Gove[illegible] Assembly [illegible]

decided on July 25 at the end of a two-day debate (1) to abolish the monarchy (2) to proclaim Tunisia arepublic, and (3) to invest M. Habib Bourguiba (the Prime Minister) with the functions of Head of State and with the title of President of the Republic

Kashmir Affairs

Kashmir issue has been entangled in power politics Instead of naming Pakistan as an aggressor in Kashmir the Security Council has tried to make Pakistan the aggrieved party

Kashmir s Intregration with India

The Kashmir Consembly on November 17 1956 adopted the Constitution of the State reaffirming that State of Jammu and Kashmir ' is and shall continue to be integral part of Union of India ' The Constitution was inaugurated on January 26 1957

U N Security Council and Kashmir

The United Nations Security Council on January 24 1957 approved a resolution calling for the maintenance of the *status quo* in Kashmir while the Council continued consideration of the dispute between India and Pakistan over the State s future

The resolution which was adopted by a vote of ten to none with the Soviet Union abstaining reminded the Governments and authorities concerned of six resolutions adopted by the Council between 1948 and 1950 declaring the principle that a plebiscite conducted under United Nations auspices should decide final disposition of the State

It further said that any action taken by the Constituent Assembly of Kashmir, or action by the parties concerned in support of any such action by the Assembly would not constitute a disposition of the State in accordance with the principle of a free and impartial plebiscite

The resolution was sponsored by Australia Colombia Cuba Britain and the United States

The Jarring Report

On February 21 1957 the Security Council adopted a resolution by which it requested Mr Gunnar Jarring to examine with the Governments of India and Pakistan any proposals which were likely to contribute towards the settlement of the Indo Pakistan dispute

In pursuance of this resolution Mr Jarring arrived in Karachi on March 14 Discussions were held with the Government of Pakistan from March 15 to 20 and again between April 2 and 5 with the Government of India between March 24 and 28 and again between April 6 and 9 Before departing from the sub-continent an other consultation with the Pakistan Government took place on April 10 Mr Jarring departed from Karachi on April 11 He prsented his report to the Security Council on April 30 1957

On the whole the Jarring report presented in clearer perspective certain issues which earlier resolutions of the Security Council had tended to slur over

Graham Mission

The Security Council passed a resolution on 2 December 1957 to send Mr Graham to visit India and Pakistan and explore the possibilities of settlement of the Kashmir dispute India did not accept the resolution Mr Graham visited India and Pakistan and his report is eagerly awaited

NOBEL PRIZES FOR 1957

Peace Prize The former Canadian External Affairs Minister Mr Lester B Pearson, (October 14)

Mr Pearson is the first Canadian ever to receive the Nobel Peace Prize

Mr Pearson had spearheaded a campaign in the United Nations last autumn to bring peace to West Asia where Britain and France had joined Israel in an attack on Egypt Largely as a result of Mr Pearson's efforts, a U N Emergency Force was organized for duty in Egypt

Literature Prize (October 17) M Albert Camus the French novelist and philosopher

M Camus (44) will be the youngest winner of the literature prize with the exception of Rudyard Kipling who was a year or so younger when he received the Prize

Physiology and Medicine (Oct 24) Prof Daniel Bonet Swiss born inventor of the synthetic surgical form of curare—the ancient South American Indians arrow poison

This drug is now generally used in producing safe narcosis with complete muscular relaxation

Prof Bonet, who was born in Nuechatel, Switzerland in 1907 is a nationalized Italian and is now Head of the Department of Pharmacology at the Institute Superiore di Sanita in Rome He is also well known for his work on anti histamines and sulphanomides.

Chemistry Britain's eminent biologist Sir Alexander R Todd of Cambridge University (October 31) for work dealing with matter inside the simplest cells

Physics (October 31) Two young Chinese nuclear scientists now working in the United States for moving important obstacles to the understanding of the functions of the atom and the universe

The joint winners of the award were Dr Tsung Dao Lee 31 year-old Professor of Physics of Columbia University and 27 year old Dr Chen Ning Yang Professor of Physics at the Institute for Advance Study Princeton, New Jersey

The investigations conducted by them in effect blew up the so-called parity laws in nuclear Physics which had been generally recognized for more than three decades as fundamental laws of nature

NOBEL PRIZE WINNERS

(1901 - 1957)

Dr Alfred Bernhard Nobel, a Swedish Scientist was born in 1833 and died in 1896. He was the inventor of dynamite He left a fortune of £ 1 750,000 and a large part of this was bequeathed to a fund which was to provide annual prizes to those persons who had most contributed to the benefit of mankind There are five prizes awarded for Physics Chemistry Physiology or Medicine Literature and Peace Each prize is worth £ 12 000 but the amount may vary

PHYSICS

1901 W. C. Roentgen (Germany)

Recipients of the Award

1954—1 B G Kher, former Indian High Commissioner in London
2 V K Krishna Menon India s representative at the United Nations
3 Nandlal Bose famous Indian painter
4 Satyendra Nath Bose eminent scientist
5 Zakir Husain leading educationist

1955—1 Dhondo Keshav Karve social worker and pioneer of women s education Poona
2 Jehangir Ratanji Dadabhai Tata, eminent industrialist of Bombay

1956—1 Fazl Ali formely Chairman of the S R C.
2 Shrimati Jankibai Bajaj
3 Chandulal Madhavlal Trivedi, Governor of Andhra

1957—1 Sri Prakasa Governor of Bombay
2 Motilal Chimanial Setalvad Attorney General of Iddia
3 Ghanshyamdas Birla eminent businessman and industrialist.

PADMA BHUSHAN

The award is made for distidguished service of a high order in any field including service rendered by Government servants

It has the same design as the Padma Vibhushan, with the difference that on its obverse the word Padma appears above and the word Bhushan below the lotus flower Further the rim the edges and all embossing on either side are of standard gold, except the name of the decoration, which is of gold

Recipients of the Award

1954—1 P.S. Rau formerly Adviser to the Rajpramukh of PEPSU
2. S Kumar Sen, formerly Chairman, National Electoral Commission of Sudan
3 K.S Thimayya, (Lieut General) formerly representative of India and Chairman Neutral Nations Repatriation Commission in Korea
4 Homi Jehangir Bhabha Chairman Atomic Energy Commission
5 Shanti Swarup Bhatnagar (late) formerly Secretary Ministry of Natural Resources and Scientific Research
6 Mahadeva Iyer Ganapati Development Commissioner Kandla Port Project
7 Jnan Chandra Ghosh Vice Chancellor Calcutta University
8. Maithili Sharan Gupta Hindi poet, Jhansi
9 Radha Krishna Gupta Chief Engineer Projects Bhakra Nangal
10. Raghunath Rai Handa, Chief Engineer Bhakra Canals
11 Amarnath Jha Chairman Bihar Public Service Commission
12 Ajudhianath Khosla, formerly Chairman of the Central Water and Power Commission
13 Kariamanikkam Srinivasa Krishnan, Director National Physical Laboratory New Delhi
14 Hussain Ahmed Madni, Principal of Madrasa ul Uloom Deoband, U P
15. Josh Mal Sahabadi Urdu poet
16 Vaikunth Lallubhai Mehta Chairman, All India Khadi and Village Industries Board
17 Vallathol Narayana Menon, Malayalam poet
18 A Lakshmanaswami Mudaliar Vice Chancellor Madras University
19 Vesharma Narahari Rao retired Comptroller and Auditor General of India
20. Jamini Roy famous artist Calcutta
21 Satyanarayan Sastri Ayurvedic physician
22 Shrimati M S Subbalakshmi, eminent musician Madras

1955—1 Suniti Kumar Chatterji, Chairman West Bengal Council
2 Pran Krushna Parija, Pro-Chancellor, Utkal University
3 Fateh Chand Badhwar formerly Chairman, Railway Board
4 Sunder Das Khungar, General Manager, Bhakra Dam Project
5 Attur Rangaswami Venkata Acharya Consultant to D V C.
6 Lalit Mohan Banerji President, Medical Education Society of Bengal
7 Vasant Ramji Khadkar Director Indian Cancer Research Centre Bombay

9 Shrimati Kamla Devi Chattopadhyaya, eminent social and public worker
10 Surendra Kumar Dey, Administrator Community Projects
11 Madapati Hanumantha Rao social worker of Hyderabad
12. Shrimati Rameshwari Nehru, social and public worker

1956—1 Shrimati Rukmini Devi Arundale M P
2 Rajshekhar Bose
3 Dhyan Chand hockey star
4 Malur Srinivasa Thirumale Iyengar
5 Kanwar Sain Chairman, C.W P C.
6 Shrimati Pushpavati Janardanrai Mehta
7 Shri Cottari Kankaiya Nayudu distinguished cricketer
8 Muthulakshmi Reddi
9 Kasturi Srinivasan Editor "Hindu"
10 Shrimati Mahadevi Varma M.L.C.
11 Tiruvadi Sambasiva Venkatraman
12 Bhai Vir Singh (late) poet Panjab
13 Nawab Zain Yar Jung

1957—1. Abid Husain Jamia Millia Islamia, Delhi

2. Bhikham Lal Atreya *Head of the Department* of Philosophy Banaras Hindu University
3 Shrimati T Balasaraswathy Bharata natyam artist
4 Rm Alagappa Chettiar Philanthropist of Madras
5 *Hazzari* Prasad Dwivedi Head of the Department of Hindi Banaras Hindu University
6 Shrimati Lakshmi N Menon M P
7 Redha Kumud Mukherji M P
8 Ustad Mushtaq Husain Khan eminent musician
9 K A Nilakanta Sastri eminent historian and indologist
10 Kishakke Covilagam Kutti Ettan Raja, formerly Director General of Health Services, Government of India
11 Shrimati Andal Venkatasubba Rao Founder
12 Seva sadan Madras N Pandit Shrikrishna Ratanjankar Musician Vice Chairman of Audition Board All India Radio
13 Shyamanandan Sahaya Vice Chancellor Bihar University
14 Govind Sakharam Sardesai *eminent historian*
15 Boshi Sen Scientist Vivekananda Laboratory Almora Uttar Pradesh
16 Siddheswar Varma Sanskrit scholar and Philologist

1958—1 Ustad Allauddin Khan Musician
2 Shri Jehangir Ghandy Director in charge Tata Iron and Steel Company limited Jamshedpur 3 Rao Raja Hanut Singh Sportsman 4 Dr Narayan Subrao Hardikar, M.P, Social Worker 5 Shri Ariyakudi Ramanuja Iyengar Musician 6 Shrimati Kamalendumati Shah of Tehri Garhwal 7 Shri Kumar Padma Sivasankara Menon Ambassador of India, Moscow 8 Shri Arathil Candeth Narayanan Nambiar Ambassador of India Bonn 9 Dr Kuppali Venkatappa Gowda Puttappa Vice-Chancellor Mysore University 10 Prof Poola Tirupati Raju Jaswant College Jodhpur 11 Shri Debi Prosad Roy Choudhry, Artist, 12. Shri Salim Ali, Ornithologist, 13 Dr Rustom Jal Vakil Physician Bombay 14 Maharajkumar Vijaya Ananda of Vizianagram Sportsman 15 Shri Surya Narayan Vyas of Ujjain *Astronomer* and Philologist 16 Dr Darashaw Nosherwan Wadia Geological Adviser to the Government of India in the Department of Atomic Energy

PADMA SHRI

The award is made for distinguished service in any field including service rendered by Government servants

The name of the decoration is embossed in Hindi with the word Padma above and the word Shri below the lotus flower on the obverse The rim the edges and the embossing on either side are of stainless steel except the make of the decoration which is of gilt silver other details of its design being the same as those of the Padma Vibhushan

Recipients of the Award

1954—1 S P P Thorat (Major General) formerly Officer Commanding Custodian Force of India in Korea
2 Shrimati Asha Devi Aryanayakam Wardha
3 Birbhan Bhatia Professor of Medicine, Gandhi Memorial Medical College Lucknow
4 Shrimati Perin Captain Orient Club Building Bombay

THE SUMMIT CONFERENCE

For the last few months there has been a talk about some kind of Summit Conference Every peace loving country—its leaders and its people—have welcomed the idea of a high level meeting of the heads of Governments of big Powers to ease the prevailing tension in the world It is hoped that direct discussions among the heads of the great Powers might succeed where every other political and diplomatic device to break the East West deadlock has failed so far Efforts have been made through United Nations and through diplomatic channels to bring some kind of concord among the conflicting East West nations but day by day the tension had been increasing due to the progress of production and testing of new and deadlier nuclear weapons by Russia America and Britain The tension has reached such a pitch that any wrong step to use force in settling international disputes may lead to world wide conflagration and ultimately to nuclear war and the destruction of mankind Therefore, any move to reduce the tension and remove the danger of a war at this critical juncture must be hailed by peace loving nations Such a move came from the Soviet Union who called for a meeting of the heads of East West Governments and every country became interested in this matter as the peace of the world depends on its outcome

What Led To Cold War

The question can be asked What led to the deterioration of amicable relations between Soviet Russia and the Western countries ? Why the war time allies fell out after defeating their common fascist enemy ? A very simple answer is that the Soviet Union and the Western countries have different and quite opposite political ideologies and each side is endeavouring to spread its area of influence which the other side does not approve The origin of this conflict can be traced back to pre-war years The war only temporarily brought Russia and Western countries together with the common aim to defeat the common enemy But even during the prosecution of war there was a big split among Russia and Western allies Each side fought its own war on its own front and under its own military commanders The Soviet leaders camplained of the inadaquacy of supplies under lend and lease arrangement and accused the Western countries of delay in opening a Second Front The Western allies blamed Russia for not declaring war on Japan After the victory the differences came into the open The two sides quarrelled on the terms of peace to be offered to the defeated foes Russia had sovietised the countries which she had occupied during the war and had fringed its western boundaries with satellite states Poland East Germany Czechoslovakia Hungary Rumania Bulgaria Albania Yugoslavia—in all these countries puppet communist governments were installed under the aegis of Moscow Russia broke all pledges given to these countries during the war Seeing the ever spreading sphere of communism in Europe the United States initiated military and economic aid to European countries under the Truman Doctrine and the Marshall Plan The aim was to stem the growth of Communism in non aligned countries Russia denounced these measures as 'dollar imperialism' and accused the United States of by passing the U N Russia termed these measures as calculated to divide the world into two hostile camps and replied the West by bringing forth its own 'Molotov Plan to knit more closely the satellite countries In 1948 the communists seized power in China The West became alarmed of the waxing tide of communism in the world America assumed the leadership of the West in its fight against International Communism The split widened and the world became sharply divided into two power blocs The East West rivalry was given the name of Cold War, in other words—a war of nerves U N ideals were flung to the winds and the big nations turned to power politics The leaders of each bloc began to win new allies from the ranks of few nations who still remained unattached to either side Each side began to secure for itself a position of strength by running a race for armament production This intensified the cold war still more and the world became alarmed that unless a check is made to armament race and the tension is eased the situation may lead to a third world war

The Armament Race

During the war America developed tested and dropped on Hiroshima her first atomic bomb It promptly ended a prolonged and tiresome war At the same time it also gave America a position of strength On June 19 1946 Soviet Russia proposed outlawing the production and use of atomic weapons and the destruction of all existing stocks of atomic bombs America did not agree to this as with out the atomic bomb she was no match for Russia who America said had colossal armies and a vast supply of conventional armaments On December 14, 1946 U N General Assembly adopted a U S proposal calling on Security Council to give prompt consideration to problem of safeguards for control of atomic energy and regulation and reduction of armaments On February 13 1947, the Security Council voted to establish commission for conventional armaments but Soviet Union abstained The U N Atomic Energy Commission decided on July 29 1949 to suspend indefinitely its work for the international control of atomic energy as the sponsoring powers could not come to any agreement after hundreds of meetings

In the meantime Russia had produced her own atomic bomb and its first indication was made on September 23 1949 in an announcement by President Truman that the U S. Government had evidence that an atomic explosion had taken place in the U.S S R On January 11 1952 U N General Assemply voted to establish a Disarmament Commission consisting of eleven Security Council members plus Canada On November 1 1952, the United States exploded her first hydrogen device The Soviet Government announced on August 20 1953 the explosion of her first hydrogen bomb within the last few days Thus America and Russia while openly trying to come to some sort of agreement on disarmament both were secretly producing and testing powerful nuclear and hydrogen bombs Seeing the coming danger to world peace India first raised her voice against the production of nuclear weapons and on April 2 1954 she proposed a standstill agreement on nuclear testing The U N Disarmament Commission on July 29 1954 unanimously agreed to consider India's proposal and gave full publicity to destructive power and known effects of nuclear weapons But in spite of all the good efforts of India and other peace-loving nations, the manufacture and tests of nuclear and H ibs were continued by America and Russia.

In may 1957 Britain tested her own first hydrogen bomb on Christmas Island in the Pacific On May 19, 1957, Prime Minister of India and Ceylon jointly urged ban on nuclear weapons Two days later the Prime Ministers of Japan and India jointly urged suspension of nuclear test explosions On June 14 1957, Russia proposed cessation of nuclear testing for two or three years and accepted the principle of control posts scientifically equipped within the nuclear states *Tass* announced on August 27, 1957 that Soviet Union launched Inter-continental Ballistic Missile (I C.B.M) On October 4 1957 Russia again scored a success against Western Powers by launching the first earth satellite By this time the balance of power had tilted in favour of Russia The Soviet Union boldly proposed on October 27, 1957, to disband the existing Disarmament Commission and its sub-committee and to establish a standing commission on Disarmament of all 82 U N members. This proposal was rejected On November 4 1957 Russia announced it would not take part in Disarmament Commission or its sub-committee. The U.S called this action of Russia a gesture of over confidence and blackmail" On November 19 1957 the U N Assembly adopted a compromise plan for expanding the Disarmament Commission to 25 members and continuing its disarmament talks but the the Soviet Union bluntly refused to participate even in this expanded commission on the plea that the commission had majority of members allied to Western Powers.

To end this impasse Prime Minister Nehru, on November 28 1957 appealed to the U.S and Soviet Union to stop all nuclear test explosions and ' thus show the world that they are determined to end this menace and to proceed also to bring about effective disarmament. He added It is only by direct approaches and agreement through peaceful methods that these problems can be solved '

In a *communique* issued by NATO nations on December 19, 1957 they welcomed a meeting with Russia at Foreign Ministers level to resolve the disarmament deadlock. Russia rejected this offer but proposed on January 9 1958, a meeting of the heads of Governments within two or three months While the talks about holding a summit meeting were going on Russia announced on March 31 1958 a unilateral cessation of nuclear tests This gesture from Russia has given a great hope to the success of the forthcoming summit meeting

Towards The Summit

Marshal Nikolai Bulganin, the then Soviet Prime Minister announced on January 9 1958, and on days immediately following in letters to the British Prime Minister Mr Harold Macmillan and the U S President, Mr D D Eisenhower, as well as to 17 other countries (including all members of NATO as well as Sweden and Austria) that Russia intended to call within the next two or three months a conference of Heads of Governments to consider a series of definite proposals, for easing world tension

Marshal Bulganin s letters said that the present international situation was on the one hand, a continuation of the cold war, an accelerated armaments race and a direct threat to universal peace, and on the other a gigantic desire of the people for peace and security It would therefore be useful to convene a conference of statesmen on a high level to avert the danger of another war

In his letter to President Eisenhower Marshal Bulganin suggested the following nine point agenda for the summit conference

(1) Proposal for a two or three year suspension of nuclear and thermo-nuclear tests and other aspects of disarmament

(2) Pledge to renounce the use of atomic and hydrogen weapons,

(3) Polish plan for an atom free zone in Central Europe

(4) Conclusion of an East West non aggression pact

(5) Reduction of forces stationed in Germany and in the territories of member States of Warsaw Pact and NATO

(6) Proposal for an 800 kilometer zone in Central Europe for aerial reconnaissance and photography and for the establishment of control points at railway junctions ports and trunk roads to guard against surprise attacks

(7) Expansion of international trade

(8) Prevension of war propaganda and

(9) Steps to reduce Middle East tension

In his letter to Mr Nehru, Marshal Bulganin hoped that the Indian Prime Minister would use his influence to facilitate the convening of a summit conference

In his reply to Marshal Bulganin made available on January 12 President Eisenhower made the following proposals

1 Strengthen the United Nations

3 Give people of Eastean European countries the right to choose the form of Government under which they live

4 Use of outer space for peaceful purposes

5 End new, unrestricted production of nuclear weapons

6 Stop the testing of nulcear weapons indefinitely

7 Reduction of conventicnal weapons and military manpower

8 Guarantee against the possibility of surprise attack

In a statemant on January 11 the Afghan Prime Minister Sardar Mohammed Daud Khan supported the Soviet proposals and described them as a helpful and effective step to relax international tensions

Austria s reply published on January 21, told the Soviet Union that it had agreed in principle with the idea of an East West conference to end the cold war provided it was carefully planned in advance

The then French Prime Minister Mr Felix Gaillard told Marshal Bulganin on January 14 that a world summit conference such as Russia had proposed should be carefully prepared and preceded by a Foreign Ministers meeting

In his reply to Marshal Bulganin s letter on February 5 1958 Prime Minister Nehru said We are in agreement with you that a high level conference is both desirable and necessary We should welcome such a conference whether it is confined to a few or with more members If our presence in it is generally desired and we feel that we can serve the cause of peace thereby we shall be glad to consider an invitation I earnestly trust that the intitiative which the Soviet Union is taking will result in lessening world tension and furthering the cause of peace

The Secretary General of the United Nations, Mr Dag Hammarskjold told a news conference in New York on February 6 that a summit meeting of Heads of States would not yield a useful result unless it was very carefully prepared and was directed to fairly concrete questions

At a news conference on February 3 President Eisenhower said that there was nothing at that moment in the Bulganin letters on which to base a truly favourable conclusion regarding a summit conference In a note delivered in Moscow on February 8 Mr Macmillan urged Marshal Bulganin to agree to summit

sters or, alternately through diplomatic channels

In a further communication to Marshal Bulganin the text of which was released in Washington on February 17 President Eisenhower suggested that both sides should work through normal diplomatic chanenls for an eventual 'summit conserfence

On February 20 the British House of Commons endorsed the Government's summit talks policy by a majority of 66 Replying to the debate the Prime Minister, Mr Macmillan said that he desired a summit' conference and added But I do earnestly want it to achieve at least some success

Marshal Bulganin replied on March 7 to President Eisenhower's letter of February 15 He said that the Soviet Government was ready to meet halfway the President's suggestion that a Foreign Ministers Conference should be called as a step in preparing a summit meeting Marshal Bulganin proposed that a Foreign Ministers Conference should be called in April to draw up an agenda for the summit meeting determine its composition time and place The U S officials said in Washington that the latest message of Marshal Bulganin "does not advance things very much" and they 'did not see anything new in it. On March 14 Marshal Bulganin wrote to British Prime Minister Mr Harold Macmillan that the Soviet *Government* had agreed to the preparation of a summit meeting being entrusted to the Foreign Ministers who are to meet for this purpose

The U S Secratary of State Mr Dulles declared in Manila on March 12 that the question of whether there will be an East West heads of Government conference depends on the willingness of Soviet leaders to talk "seriously about serious subjects

Mr Nikita Khrushchev *said in* Moscow on March 14 that of course all problems could not be solved at a summit conference but the 'main task consists in making a good beginning to the work of easing tension He said following issues were ripe at the present stage

1 Immediate A and H-Bomb test ban
2 Renunciation of nuclear weapons by Russia Britain and America
3 An atom free zone in central Europe
4 A non aggression pact between the NATO and Warsaw Pact
5 Reduction of foreign troops in Germany
6 Measures to prevent sudden attack ease tension in the Near and Middle East, broaden trade and stop war propaganda.

The U S., Britain and France proposed on march 31 that diplomatic talks should get underway in Moscow In April, to lay the ground work for a possible summit conference This proposal had received the unanimous approval of the 15 member NATO

On April 11, Soviet Union issued another aide memoire to the U S, Britain and France In it the Soviet Government stressed the need to hold an early meeting of Foreign Ministers to agree on the time place and composition of a summit meeting and determine the range of problems to be discussed at such a meeting

The Ambassadors of U S U K. and France notified the Soviet Foreign Minister in Moscow on April 16 that they would make themselves available on April 17 for a broad *discussion of issues involved in calling a summit* conference The Western nations said that the preliminary negotiations must reveal a real desire by all the four powers ' to make practical progress towards a settelment

Hope Of The World

The eyes of the whole world are riveted upon the outcome of the summit conference as the peace and stability in international relations depend on its success The mankind *is faced with* the terrible danger of a destructive nuclear war It is the supreme duty of all political leaders responsible for the further development of international relations to break the present deadlock Only those governments will measure up to the problems of this responsible period of mankind's history that will be able to rise above ideological differences do everything in their power to make cooperation and not hostility peace and not war prevail in international relations The urgent problems particularly those posed by nuclear weapons must be solved as soon as possible to rid the world of the spectre of third world war The atomic energy should be harnessed for peaceful use for the welfare and happiness of mankind Until different nations with different ideologies learn to live as peaceful neighbours there is very little hope of easing the present tension The lack of trust among nations must be removed. Let us hope the summit conference would be instrumental in removing tension and bringing peace to the world.

INDIAN ATOMIC ENERGY PROGRAMME

By Dr H J BHABHA

THE five countries which are at present advanced in atomic energy namely Canada France U.S.S.R U.K and U.S.A.[1] are all industrially advanced countries with a developed technical background All of them except the U S S R co-operated closely with each other in developing atomic energy during the war

While India is behind all these in atomic development and indeed has long way to go to catch up the most advanced among them its programme is nevertheless more developed than that of most countries in the world including some of the highly industrialized countries of Europe India is therefore in unique position of being the only industrially under-developed country with an important atomic energy programme

This development has been made possible by the fact that India is a very large country with a population of nearly 400 million, so that although its *per capita* production may be small, its total production is quite considerable. India is one of the largest producers of textiles in the world and in addition produces many industrial commodities like steel locomotives machine tools heavy chemicals and fertilizers which are produced in very few under developed countries This gives it a technical ability to develop on its own which is quite different from that of other under-developed countries Nevertheless whatever India may have achieved in atmoic energy has been achieved by a concentration of effort and resources by a selection of some of the best young scientists and engineers from all parts of the country and their concentration in one big research and development centre at Trombay where they can assist and stimulate each other and finally by a provision of the best available equipment The Government of India has given atomic energy development a high priority and its full support Our atomic development has depended above all on the strong and continuous backing of the Prime Minister Mr Jawaharlal Nehru to whose faith in the importance of science and its practical application indeed all scientific development in the country owes so much

Competitive Cost

Since the peaceful and the military applications of atomic energy are so closely linked, assistance in many of the crucial steps leading to the use of atomic energy for generating electricity and to the production of some of the important materials required for an atomic power programme will only be given by other countries or by an international agency under conditions which would bring the Indian programme under international inspection and control Although the Indian atomic energy programme has no military component and it has been stated categorically by the Prime Minister on several occasions that we do not propose to go in for any such military programme an independent foreign policy and non alignment with any Power bloc makes the acceptance of inspection and control unacceptable to us as long as they are not applied universally to all countries alike in the interst of peace and international security It is therefore necessary for India to plan its entire atomic energy programme so that it can move forward if necessary without any external aid This does not mean that aid from friendly countries will not be accepted when it is given without any strings being attached and indeed we have received considerable help from several friendly countries some of which are mentioned later

A study of the economics of atomic power in India has shown that electricity from atomic energy would be competitive with electricity from thermal power stations in regions of the country remote from the coal fields which indeed include the major part of the country and many of its industrial centres The competitiveness of atomic energy in most parts of India is due to the operation of three factors namely the location of its coalfields the limitations of the transport system and the general shortage of power in the industrial areas Eighty per cent of the coal used in India today is produced in the eastern corner in the States of Bengal and Bihar and coal has to be transported some 1 500 miles to important areas in the north west and south such as Delhi Ahmedabad Bombay and Madras The true price of coal at these areas is therefore such as to make electricity from thermal stations more expensive than electricity from atomic power stations even today Secondly the railway system is already heavily little

spare capacity. A considerable increase in railway transport capacity will in any case be necessitated by the industrial development of the country thus involving an expenditure of large sums of money. One third of all the goods traffic carried by the railway at present is coal which is incidentally carried at a subsidized rate and, therefore represents a burden on the economy. The future development of electric power in a manner which does not involve a formidable increase in coal transport will therefore save the country large sums of money and a further capital expenditure on the railways. Finally, power in industrial areas is so short that the grid systems as a whole have a very high load factor, a situation which is necessary and favourable for the economic operation of atomic power stations. The Government of India therefore have under consideration the setting up of one or more atomic power stations in the period immediately ahead. If a decision to set up one were taken in the current year the power station would not be in operation till 1962 and atomic power would therefore only make a contribution during the third Five Year Plan. It is however necessary that we should embark on such a programme now in order to be able to take advantage of the developments in atomic power generation, which are bound to take place in the next few years and thereafter.

To instal a million kilowatts of net electrical capacity from atomic power stations during the third Five-Year Plan that is by 1965 is today entirely feasible technically and desirable economically. Whether and to what extent such a programme will be embarked upon will depend principally on financial rather than economic consideration.

Fifteen Years Goal

For all these reasons it has been decided to go ahead with a research development and production programme which will make possible the construction and operation of atomic power stations in India within the next ten to fifteen years.

On the industrial side it is intended to produce within the country all the materials required for a full atomic power programme. For this reason a start was made by setting up a plant at Alwaye in South India to [illegible] the well known monazite sands on the west coast. In addition to producing rare earths and trisodium phosphate, a cleaning material sold in the market, this plant produces a cake containing thorium and uranium. This cake is brought to the plant at Trombay near Bombay which produces a very pure thorium salt and also a uranium salt. This plant was built by our own scientists and engineers and has been in operation since 1954. Its capacity increased sixfold last year.

There has been designed a small uranium plant which will turn this uranium salt into reactor grade uranium metal, and it is expected to have this plant in operation by the middle of 1958. This plant will give us enough uranium metal for experimental purposes and for use in the reactors that are under construction at present. It will also give our scientific and technical staff the necessary experience for the design and construction of the large uranium plants which will be required by a full atomic power programme.

A small plant for the fabrication of fuel elements has also been designed and its construction is being undertaken forthwith. Besides producing the fuel elements for our currently scheduled natural uranium reactors it will also enable research and development work to be carried out on new types of fuel elements and their canning.

India is one of the largest producers in the world of the rare mineral beryl from which the metal beryllium can be obtained, the present annual production being several thousand tons of high grade beryl. Beryllium oxide may have interesting possibilities as a moderator and the metal or one of its alloys holds out great promise as a canning material. A large pilot plant for producing atomically pure beryllium oxide of nuclear purity and sintering it into bricks is also being designed. Its capacity will be about 15 tons of beryllium oxide per annum but it will be capable of expansion to several times this size. Preliminary studies indicate that the cost of beryllium oxide produced in this plant will be lower than the cost at which it is being produced in Europe at present.

It is also intended to produce heavy water in quantity and the decision was taken two years ago to produce heavy water and fertilizer together in a large plant which is being built at Nangal in the north. This plant will produce over 340 000 tons of nitrogenous fertilizer annually and between 10 and 20 tons of heavy water. Hydrogen for the ammonia plant will be made electrolytically. The heavy hydrogen will be concentrated in the last stage

in the electrolysis cells which will be arranged in cascade The heavy hydrogen from these cells, which will comprise between 20 and 40 per cent of the total stream will be liquefied and the deuterium extracted by the hydrogen distillation process The plant has been placed at Nangal so that it can draw cheap power from the dam at Bhakra It will consume 160 000 kilowatts of electric power and cheapness of power is essential for the economics of the process It is estimated that by charging to heavy water only the direct costs involved in its production the cost of heavy water will be about $ 20 per pound which is substantially lower than the present world price Production will commence in 1960 Several other large fertilizer plants are expected to be constructed during the second Five Year Plan and it is the intention of the Government to produce heavy water in all of them

Studies are also being made for the erection of a plant to make atomically pure graphite from the coke produced in a refinery in Assam Experiments which are under way at the Atomic Energy Establishment at Trombay have already shown that graphite of a high density can be produced by a method which is being tried

Zirconium is another metal which has promise as a canning material In order that it should be so used hafnium has at first to be separated from it and quite a good deal of research work has been done on the separation of hafnium from zirconium A process is now being tried out which is even more promising than the one reported by us at the Geneva Conference on the Peaceful Uses of Atomic Energy This method promises to yield metallic zirconium free from hafnium in one step Zircon the mineral from which zirconium can be obtained is found as a constituent of the famous beach sands on the South West coast of India and is available in plentiful supply

Any country, which does not wish to depend wholly upon outside aid must have its own research and development organization not only for investigating the many possibilities which remain unexplored but also because even in fields where general knowledge is available practical experience and detailed know how are to be obtained The Atomic Energy Establishment at Trombay near Bombay which was formally inaugurated by the Prime Minister in January last year is Indias centre for research and development in the field of atomic energy

Research Activities

A layout of the entire Establishment has been prepared and some buildings completed while the construction of others will start very soon Some of the new laboratories will be ready early this year although all the buildings planned at present will not be ready till 1959 The Establishment is located at Trombay some 15 miles from the centre of Bombay The site of the Establishment which covers an area over 2 000 acres is completely separated from the rest of the industrial area of Trombay by Trombay Hill on its west Its eastern side lies on the upper reaches of Bombay Harbour

The research activities of the Establishment were however started without waiting for the new buildings to come up The Physics and Engineering Divisions were located in the Tata Institue of Fundamental Research at the Old Yacht Club building and in war time hutments on its new site at Colaba A warehouse in another part of Bombay was converted for housing the Chemistry Division while the Biological and Medical Divisions were set up at the Indian Cancer Research Centre The total scientific and technical staff of the Establishment is now about 400 and it will increase to over 800 by 1959 By this time the total number of workers on the site including administrative maintenance and workshop staff will be over two thousand

To ensure a steady supply of trained scientific and technical personnel there has been started a training programme under which 250 young graduates and engineers will be recruited annually from the universities and given supplementary training for a year to fit them for work in our atomic energy programme The first course commenced in August last year with 170 trainees It is hoped to increase the intake of this school to 350 a year in due course

Apsara

Apsara India s first atomic reactor or the swimming pool type reached criticality for the first time on August 4 1956 It is the first reactor to go into operation in Asia outside the U S S R It was designed, engineered and built entirely by our own people and by Indian industry except for the fuel elements The fuel elements which contain enriched uranium have been provided by the United Kingdom Atomic Energy Authority

The decision to [illegible] taken in April, 1955 A [illegible] basic

design was made in August, 1955 and it took about one year to complete its construction

As soon as the decision to build the Swimming Pool Reactor was taken in early 1955 our attention was given to the next step of building a powerful high flux reactor for engineering research Several different types were being considered when there was received a generous offer from the Canadian Govenment to set up a reactor of the NRX type in India The decision to proceed with the joint project was taken in August 1955 and the ground for it was broken in February, 1956 This reactor is expected to be completed early in 1959 This reactor requires some 20 tons of heavy water which was sold to us by the United States' Atomic Energy Commission

A short while ago it was decided to build a third zero energy reactor which will enable us to study the effect of different lattices shapes and sizes of fuel elements mixed lattices containing uranium or plutonium and thorium, and so on This reactor is expected to be in operation in 1958 also and indeed it may be the second reactor actually to go into operation in India

The immediate need in many parts of India is for small power stations of about 20 mega watts, and it is our intention to study for this purpose reactors moderated with beryllium oxide gas cooled and working on natural or slightly enriched uranium Since the critical size of beryllium moderated reactors is smaller than graphite moderated ones preliminary calculations show that they may well be more economical in the power range below about 20 megawatts For this purpose there has been for some years a joint project with the Commissariat a l Energie Atomique of France for studying the properties of beryllium oxide as a moderator A small group at our Trombay Establishment is now actively engaged in feasibilty studies on beryllium oxide moderated reactors of a power output below 30 megawatts

The Indian atomic energy programme is of a very modest size compared with the programmes in the United States the Soviet Union and the United Kingdom. It has no military component and one may recall on this occasion the words of the Prime Minister Mr Nehru, at the inauguration of the Trombay Establishment, when he said whatever might happen whatever the circumstances we shall use atomic energy for evil purposes." Although the Atomic Energy Commission was established as an advisory body in 1948 in the Ministry of Natural Resources and Scientific Research the work did not really develop until a separate Department of the Government of India with the full powers of a Ministry was established in August 1954 Since then the work has progressed very rapidly and the expenditure on atomic energy has grown about twelve fold within three years Only a modest beginning has been made which may greatly help to accelerate the industrialization of the country

—o—

OLYMPIC MOVEMENT IN INDIA

The organisation of athletic sports in India on country wide scale began in 1923, when on the eve of the eighth Olympics at Paris (1924) a provisional National Olympic Committee was formed The Committee organised the first All India Athletic meet which was held at Delhi in February 1924

The first properly sponsored Indian team of seven athletes participated in the World Olympics in 1924 at Paris

At the time of the second National Athletic Championships held at Calcutta in 1927 the provincial representatives present for the meet decided to replace the provisional Committee by a properly constituted Indian Olympic Association

In 1928 at Amasterdam Olympics India won the world hockey title which she has retained till now

The Indian Olymic Association took over the responsibility of controlling and organising various sports in the country and held biennial Olympic Games from 1928 onwards

A separate organisation for athletics known as the Amateur Athletic Federation of India came into existence in 1946

The National Athletic Championships instead of being held every two years along with the Indian Olympic Games were made an annual feature from 1949 by the Federation

A beginning in Asian games was made in 1934 when the first Western Asiatic Games were held in New Delhi In 1951, they were replaced by Asian Games the first meet again was organised at New Delhi

The second Asian Games were played at Manila (Philippines) in 1954 India stood fourth with five gold medals

THE FOREIGN EXCHANGE CRISIS

By J N MAHALANOBIS

THE acute shortage of foreign exchange with which this country is faced now could have been reasonably anticipated when the plan was formulated To be precise the weakest part of the plan related to foreign exchange position In spite of optimistic estimates a clear gap of Rupees 400 crores was left uncovered hoping that this would be covered by foreign aids and loans This gap has now very much widened due to increased imports both in value and volume It is true that during the first plan period substantial loans and aids were available from different sources particularly from U.S A and other world organisations but even assuming the same order of assistance would be available from the sources the deficit would remain Another mistake was that the deficit was calculated on the basis of 1955 prices but even in that year indications were available that the world prices were moving up especially in countries which would supply us bulk of the machines and other equipment for our capital projects, and it would have been prudent to allow an increase of at least 25% in the price of imports on the basis of price trend observed during the last ten years It may be argued that the allowance for such price increase was not thought necessary as any increase in the cost of imports would be compensated at least partly by increase in the value of exports, but this is a wrong assumption. It is true that during the years 1949-51 the prices of primary products shot up to a very high level but that was an abnormal position created by Korean war And immediately after 1951 when the war fever disappeared the prices of all primary products exported from the country sharply delined An analysis of the prices of raw material and other primary praducts exported from under developed countries like India shows that the prices of these commodities tend to decline compared to industrial products Throughout the history of international trade in the 19th and also in 20th century except during abnormal period such as war or hectic boom the terms of trade have always gone against the countries exporting primary products The Indian exports which even now mainly consist of raw materials and agricultural products also suffer from the same disadvantages. It is not intended to say that all the problems could be foreseen in 1955 when the plan proposals were drafted but in regard to foreign exchange position a very realistic approach is necessary especially when a country has to implement an economic plan for a given period One may argue that the deficit in foreign exchange account may be largely wiped out by drastically reducing the imports of non essential articles as has been done down But the scope of restricting the imports of consumption goods in favour of capital goods is not very wide and any policy of drastic restriction of imports may create conditions which may affect the volume of exports and defeat the very objective of such policy

The prospect of further expansion of export trade in the near future does not seem to be very encouraging The main items of export consist of tea jute oilseeds, cotton textiles and light engineering goods Our jute manufactures have to compete with the products of other countries including Pakistan and it seems now that within a few years time the industry which enjoyed a monopoly position will have to face acute competition in world market On the demand side also the position does not seem to be imporving The current expansion of world trade and commerce do not seem to have much effect on the demand for jute manufactures There are indications that the world market for jute manufacture is gradually shrinking In tea also the prospect of further expansion seems doubtful The tea industry enjoyed high prosperity in 1954 and 1955 but 1956 has not been quite a good year, even now the prices do not appear to indicate a firm trend In future increased competition from other tea producing countries of the world may bring down the world tea price and the value and volume of Indian tea exports may fall Indian Cotton Textiles are being exported in increasing volume to South East Asian countries and also to Middle East but the capacity of the consuming markets to absorb larger volume is limited and foreign exchange earnings on this account cannot suddenly increase even though a gradually increasing trend in the volume of export is probable over a number of years In other miscellaneous articles also the

penditure. The main items of the programme under implementation are the following

Youth Leadership Training Camps

It has been accepted on all hands that in all kinds of youth welfare work for students the organisation and leadership should be in the hands of the teachers who are the natural leaders of the youth in their charge. This would arouse the staff to a greater sense of their fuller duties and would also help to bring about friendly co-operation and understanding between the two important groups—the teachers and the taught. Further it would prevent the exploitation of students by outside and unacademic organisations. In order to give useful directions to the teachers in guiding their students in various co-curricular activities the scheme of Youth Welfare includes the organisation of Youth Leadership Training Camps.

In these Camps the teachers are given short term training in the techniques of Youth Leadership and effective organisation of co-curricular activities and educational institutions. The problems of the youth are explained and solutions are suggested through talks and discussions by experts in different subjects on Youth Welfare.

Six such Camps have so far been organised directly by the Youth Welfare Section of the Union Ministry of Education & Scientific Research. The first Camp was held at Srinagar for selected members of the staff of the colleges of the Punjab University, the second at Mahableshwar for the Universities of Baroda, Bombay, Gujarat, Poona and Karnatak, the third at Caubatia (Ranikhet) for the Universities of Aligarh, Agra, Lucknow, Banaras and Allahabad, the fourth at Lovedale (Ooty) for the Universities of Madras, Andhra, Mysore and Travancore, the fifth at Darjeeling for the Universities of Calcutta, Visva Bharati, Gauhati, Patna, Bihar and Utkal and the sixth at Hyderabad for the Universities of Agra, Nagpur, Osmania, Annamalai, Venkateshwara and Saugar.

Dramatic Training Camps

Training in the art of dramatics has been given an important place in the programme of work as drama is one of the most important cultural activities in our educational institutions.

Three dramatics training camps have already been conducted, one at Andretta, the second at Sabathu and the third at Metheran. These Camps have been found to be of great educative value and it has been felt that [illegible] such Camps should be conducted to [illegible] all the colleges.

As it is not possible for the Ce[illegible] [illegible] conduct the required number of camps it [illegible] been suggested to the Universities and S[illegible] Governments that they may organise th[illegible] own Camps for which Centre will give fi[illegible] aid to the extent of 75% of the expendit[illegible] upto a maximum of Rs 3,000/ for each pr[illegible]ject. The Universities of Jammu and Kash[illegible] Annamalai and Gujarat and the former PEP[illegible] State Government have been given grants f[illegible] holding such camps.

Educational Tour

Tours to places of historical importan[illegible] scenic beauty, cultural interest and big na[illegible] al projects have great educative value for th[illegible] students. Government therefore provid[illegible] facilities of travel to students for this purpo[illegible] under a special scheme. Under the scheme the Government of India gives 75% of th[illegible] Railway or Bus fare at student's concessio[illegible] rate to small manageable batches of studen[illegible] going on educational tours. Since the incep[illegible]tion of this scheme over Rs 3 lakhs have bee[illegible] sanctioned to about 400 institutions and ov[illegible] 10,000 students have benefited from th[illegible] assistance.

Youth Hostels

In order to provide cheap food and accom[illegible]modation to the students, while on tour [illegible] is intended to set up a network of Yout[illegible] Hostels in the country. This work is carrie[illegible] out through —

(1) Youth Hostels Association of Indi[illegible] (2) State Governments and (3) Joint Projec[illegible] by the Ministry of Education and Scienti[illegible] Research and the Ministry of Transport.

The Youth Hostel Association of India [illegible] a private organisation engaged in encourag[illegible] Youth Hostels movement in the country. According to the information available nea[illegible]ly 115 Youth Hostels are functioning in the country. Since most of these buildings ar[illegible] Hostels attached to colleges their use is limit[illegible]ed to the vacation time.

The Government of India gives financ[illegible] assistance to State Governments to meet th[illegible] 50% of the expenditure for the constructio[illegible] of Youth Hostels subject to a maximum o[illegible] Rs 20,000/ for each project.

The Government of India also propos[illegible] to construct a few model Youth Hostels [illegible] selected places in the country. A tentat[illegible]

scheme for this purpose has been drawn up which is under furth r examination

Youth Welfare Boards

In order to set up a compreh nsive organi sation to implement Youth Welfare Program me for the Youth in and outside educational institutions the Government of India has suggested that each State should set up a State Board of Youth Welfare under the president ship of its Governor

Under this Board three kinds of committees can function a University Youth Welfare Committee a School Youth Welfare Commit tee and a Non student Youth Welfare Com mittee The objective of these Boards and Committees is to initiate and implement a comprehensive programme for the welfare of the Youth Universities and College Youth Welfare Committees which are to implement the programmes, are to be so constituted having equal representatives of the students and the staff Thus the vo ce of the young will be heard in matters which concern them and they will be actively associated with the planning of the programme This will affo d them ample opportunities for s lf ex pression and self development

To g ve a fill p to this scheme the State Governments and Universities will be eligible for financial help to the extent of 50 per cent of the [administrative expenditure upto Rs 10 000/ for a State Youth Welfare Board and Rs 4 000/ for a University Youth Welfare Committee The Universities of Rajasthan Annamlai and Agra have been given financial help for the scheme

Survey Of Living Conditions

In order to enquire into the socio economic conditions cultural interests and study habits of the young it is proposed to conduct a sur vey of the living conditions of students To begin with it is intended to conduct a pilot survey and the Universities of Delhi Banaras Jadavpur Nagpur Bombay and Travancore have been included in this project

Non Student Youth Clubs

In order to attend to the needs of the Non Student Youth the State Governments have been informed that their requests for financial assistance to meet 50 per cent of the expenditure upto a maximum of Rs 5 000/ for each Club or Centre will be considered

Youth Festivals

The problems of the youth are predominantly emotional and therefore their cultural and emotional needs must find an important place in the programme of work for their welfare The Inter University Youth Festi val held in 1954 was the first of its kind in the country and it made its mark as a suitable activity for the satisfaction of cul tural emotional and artistic urges of the youth The educative value of the event has been accepted at all hands and on account of its popularity the function has been made an annual feature of the Youth Welfare Pro gramme

The three Inter University Youth Festi vals conducted so far give a definite indica-tion that the enthusiasm among the students in this programme has been steadily increasing The items included in the programme of the Festival are intended to satisfy the artistic and cultural urges of the youth Drama being one of the most popular and best means of expression and of general education has been made an important feature of the Festi val

The practice of craf s will make our young men more skilful more able to sublimate the urge to power and more handy about their homes

The practice of mus c and dance will pro vide the necessary impetus for the expr ssion of the creative urge and will impart zest and joy to life

The Hindi Elocution Contest will serve to arouse keen interest in our national language thus ensuring unity in diversity

It is hoped that when fully implemented this comprehensive Youth Welfare Programme will help produce able and y ung leaders with broad national outlook to shoulder heavy res ponsibility in New India

In view of the importance of the Youth Welfare Programme in the cultural develop-ment and promotion of basic unity of the coun try the Second Five Year Plan has provided a sum of nearly Rs 7½ crores for the various activities aimed at canalising the youthful energy into constructive channels

These activities are also intended to deve lop the resource resilience and responsibility of the youth. These include comprehensive Youth Welfare Programme Physical Educa tion Sports and Games Labour and Social Service Camps and National Discipline Scheme

PICTURES OF THE MOON

By LUCIEN NERET

NOT long ago news agencies announced that the Soviet scientist Nicolai Kuprevich had obtained a televised picture of the moon Stated in this way the news appeared fantastic or, to say the least very confusing Could it mean that a TV camera had been landed on the moon had taken pictures and transmitted them back to earth where they were picked up by Professor Kuprevich ? The answer of course is no—at any rate not yet ! But Professor Kuprevich s experiment is well worth describing

He told us about it in his laboratory at Pulkovo Observatory near Leningrad where he was busy putting the finishing touches to a new TV receiver

' It happened this way," he said "One day in 1952, I was reading an American magazine when two photographs printed side by side on the page suddenly caught my eye They both showed th same young woman But whereas one was an ordinary photograph, the other had been taken by photographing the reproduction of the original shot transmitted by a camera onto a TV receiver screen Yet there could be no doubt about it, the picture taken by the television process was much more luminous detailed and clear than the ordinary photograph

'This gave me the idea of applying the process to astronomical photography For some time past I had been grumbling bitterly about the difficulties we were having in getting decent photographs of the moon The biggest photographs we had—obtained with an excellent telescope—were never more than 14 centimetres (about 5½ inches) in diameter And even then, the enlargement had been obtained at the expense of luminosity, or precision in detail. You see to accentuate the contrast between light and shade you have to increase exposure time but this is often impossible due to atmospheric disturbances The same thing would happen if you tried to photograph a tree on a very windy day if the exposure time is long the leaves of the tree will be invisible

Nicolai Kuprevich was certain that television could provide an answer to his problem But between his discovery of the two pictures in the American magazine and ultimate success lay years of research and exper tion

A special camera had to be fitted to th eye piece of a telescope, an iconoscope had to be built then an amplification chain finally, a special receiver But in J 1956 everything was ready, and the pictures were taken with a small lens

Today a large telescope originally built fo solar observations is being used in this and the Russian scientists have been able obtain photographs measuring 1.50 (nearly 5 feet) in diameter of the illumina hemisphere of the moon, in which such d as craters etc., stand out very clearly

Alongside these pictures in Pr Kuprevich s laboratory was another set seemed out of focus An unsuccessful ment , he commented wryly I tried to take photograph of the moon enlarged to a d of 5 metres (16 feet) with not very satisfac tory results as you can see I shall have to change my illumination amplifier, and that very difficult '

Is Professor Kuprevich s method likely influence future astronomical observations I is difficult to say yet But applied to luna observations it should certainly provide im portant data on the moon s physical character stics

At the present time many astronomers confess sad gaps in their knowledge with regard to the moon s relief A few years ago sensational articles appearing in the press spoke of large constructions which were said to have been observed on the face of the moon.

The facts are as follows In August 195 two British astronomers H P Wilkins and Patrick Moore perceived what they took to be a gigantic bridge spanning the *Mare Crisium* Speaking on the BBC Wilkins reported that its total length was about 18 miles that it stood at least 500 feet above the moon s surface on which it cast a shadow and that it narrowed towards the centre its width varying from about 1 to 2 miles

Other observers have reported seeing li in different parts of the moon This fact is mentioned in the report of the Royal Astrono

mical Society of Great Britain which organized permanent observations of the *Mare Crisium* over a three year period

As far back as 1826, the astronomer Gruithiser reported alignments of lights on the moon These were so regular that he thought they might even be the streets of a town illuminated at night. But modern astronomy refutes this as pure fantasy Speaking of the alignments the famous British astronomer Fred Hoyle said that the brilliant streaks were probably jets of vitreous matter that had fused projected by the same explosions which produced the neighbouring craters

But the real object of such observations is not the quest for ' selenites or alleged moon dwellers The moon is a dead planet with no water, a tmosphere or vegetation and it is being constantly bombarded by meteorites and the sun s ultraviolet rays What astronomers are interested in today is the moon s geological characteristics some of which are undoubtedly similar to those of the earth So similar in fact that some astronomers have put forward the theory that the moon broke away from the earth. Osmond Fischer and later George Gamow have both said that the earth still bears the scar of this separation under the waters of the Pacific Ocean But most scientists nowadays reject this hypothesis for reasons that are easy to uderstand For example, Alexandre Dauvillier a professor at the College de France commented The volume of the (Pacific) Basin is 34 times smaller than that of the Moon and the separation occurring at a period when the Earth was completely molten could not have left a scar

Fred Hoyle, for his part believes that the Earth and the Moon were formed very close together while Vladimir Krat head of the astrophysics department of Pulkovo Observatory shares a similar view 'The moon he says was formed separately from the Earth but at approximately the same distance from the Sun as our own planet

Viewed in this light the Moon is perhaps not a satellite of the Earth but a twin-sister planet. And when the era of interplanetary travel opens it is likely to become a kind of suburb of the earth for its relative closeness by interplanetary standards—only about 240 000 miles—will make it an ideal stopping off place for spaceships bound for far distant destinations. The first men to land on the moon will probably find nothing there but silence dust and desolation but with their weight reduced to one sixth of what it is on earth they will be able to rush around at the speed of an express train When that time comes the television camera will surely reveal some very strange pictures of the moon

into being to help the member-coun ries to tide over their difficulties The International Monetary Fund helps in matters of financial difficulties arising out of currency adjustment or to meet any temporary adverse balance of payment and the other organisation the World Bank is primarily intended to give financial assistance for longterm economic development Such help is given to specific projects which in the opinion of the Bank would yield sufficient return to pay off the loan India has received some assistance but the Bank has to meet demands from other member-countries also and may not like to put too many eggs in one basket

We have made survey of the probable source of foreign exchange earnings to show how difficult it is for this country to increase such earnings to meet the over growing needs of a developing economy Apart from physical bottlenecks to increase agricultural production for export increased internal expansion would mean that largest volume of raw materials some of which are now exported may be consumed by the local industries The position has become very much complicated by the successive failure of crop making it imperative to import large quantity of food This has already caused a heavy drainage on our slender foreign exchange resources and our sterling balance has droped very low Th s low sterling balance is not considered by many financial experts as a safe provision even against normal fluctuation of balance of payment To sum up it may be said that the present disequilibrium in our balance of payment is not a temporary phenomenon but will remain for a fairly long per od if the present rate of economic expansion continues To rectify the disequilibrium foreign loans and aids may not be enough Some sort of a scheme to bring out the gold hoard in this country is essential to pay for the cost of the plan in terms of fore gn currencies

ROBERT FROST POET OF EVERYDAY PEOPLE

By H B GARLAND

President Dwight D Eisenhower recently joined with the Poetry Society of America in honouring Robert Frost who was awarded the Society's Gold Medal for Distinguished Service to Poetry also known as the Alexander Droutzkoy Memorial Award President Eisenhower said in a message sent to four hundred leaders in art literature science and education who paid homage to Robert Frost at the Poetry Society's 48th annual dinner 'The sensitive and imaginative words of the poet contribute much to the spirit of the people It is fortunate that our nation is blessed with citizens like Robert Frost who can express our innermost feelings and speak so clearly to us of our land and life It is a pleasure to join in tribute to the great gifts of Robert Frost

ROBERT Frost who was 84 years old on March 26 1958 is the dean of American poets He was in his forties when people began to read know and admire him But with the publication of each volume of his poems his popularity has grown

No one now disputes his place as one of America's greatest living poets He won the Pulitzer Prize for Poetry—one of the nation's highest literary honors—four times On his 75th birthday the Senate of the United States did an unprecedented thing It took time off from its political activities to consider and unanimously agree upon a citation to honour him because his poetry has given the American people a long series of stories and lyrics which are enjoyed repeated and thought about by people of all ages and callings and because his poems have helped to guide American thought with wisdom and humour setting forth to our minds a reliable representation of ourselves and of all men."

Robert Frost enjoys such universal recognition and admiration for several reasons His place is and always has been singularly central He has had nothing to do with the extremes of either side This is why one can predict that he will be read beyond his time His poetry is something to almost anybody—to posterity as well as to us

Although he has no message to deliver to the world, his poems about nature, everybody life and everyday people, mostly on farms in New England, have a deep meaning He usually selects an object, an animal a person a life or whatever other thing he likes and makes it a symbol of something else which is larger and deeper than itself As we read him we seem to see behind or through his subject matter and derive pleasure from so doing

One of his critics has said No other living poet has written so well about ordinary men His wonderful dramatic monologues and scenes come out of a knowledge of people that few poets ever had and they are written in a verse that uses with absolute mastery the rhythms of actual speech"

In an editorial on the occasion of his 80th birthday, 'The New York Times gave another reason why Frost has won such wide recognition An intensely American poet the editorial said "Frost has touched those things in American life that, despite a century of urbanization, still form our emotional bedrock Our idea of human relationship our understanding of tragedy and our knowledge of hope remain firmly associated with farm houses and newly ploughed fields. Frost writes of a real world of real people succeeding in bringing the reader into it and rewarding him with a sense of experience and even moments of revelation."

The life of this great poet is quite uneventful Robert Lee Frost was born in San Francisco on March 26 1874 When he was 11, his father a newspaper editor died and his mother a teacher, settled in Massachusetts where the boy's grandfather lived. For some 20 years before he published his first book of verse Frost supported himself by working as a factory hand school teacher country newspaper editor and principally as a farmer This gave him the insight into the lives of ordinary people which is reflected in his work

His first book, A Boy's Will," wholly lyrical, was published in England in 1913 North of Boston published one year later in England and in the United States brought him much acclaim Abandoning the rhymed forms of his first volume he wrote this book rich in its spiritual values almost entirely in blank verse The critics compared Frost's moving poetry to the bucolic poetry of Theocritus to Virgil's idyls and to Words

worth s pastoral lyrics to the poems of Hesiod and Catullus

In 1916 "Mountain Interval appeared In this collection Frost again included many rhymed lyric forms, such as the sonnet and ballad But here and in all his later books the conversational colloquial tone and the dramatic manner of his poetry strike one first More than a second glance is needed to appreciate his expertness as a prosodist Gradually he grew fonder of searching among abstractions It was not surprising therefore that he should try in A Masque of Reason to get a forthright answer out of God for his bewildering treatment of Job and the rest of the human race

Steeple Bush,' his last book of new poems is largely composed of thoughtful or whimsical commentaries many of them on topics of the day aphorisms brief novels in blank verse and short or longer lyrical poems While it illustrates Frost in his latest phase as an informal philosopher who had made up his mind about the trifling nature of several matters that the world takes with too much concern it also communicates to readers his characteristic desire to provoke responses in kind

There can be no question that Frost has suffered as a sensitive nature can suffer but he refuses to acknowledge defeat and believes in the persent and the future He is essentially a moralist but he accepts the world s contradictions and regards everything about the world with love occasional amusement and tender tolerant pity

All his books show as their fundamental and embracing quality sincerity—sincerity in perception sincerity in thought sincerity in feeling and sincerity in expression The segments of life in his poem all existed first as experiences none were conceived at the desk He is sincere with life and nature He never pretends to see what is not there but he sees everything and reveals always fresh charms

For the past 30 years Frost has been a farmer and a teacher at various universities The students admire him because of his simple manners and his persistent search for truth Asked recently what he had to say to the young poet today Frost replied

One thing I care about and I wish young people could care about it is taking poetry as the first form of understanding Young poets forget that poetry must include the mind as well as the emotions Too many poets delude themselves by thinking the mind is dangerous and must be left out Well the mind is dangerous and must be left in The poet can use the mind—in fear and trembling But he must use it

Of the subject matter of poetry Frost has said 'A poem begins with a lump in the throat a homesickness or a love sickness It is a reaching out toward expression an effort to find fulfillment A complete poem is one where an emotion has found its thought and the thought has found the word

Robert Frost spends his winters in Cambridge, Massachusetts where he lectures at Harvard University and Florida where he has a small house During the summer months he stays at his farm in Vermont. After 43 years of a happy marriage he lost his wife in 1938 and of their five children only two are still alive He works late into the night and sleeps late in the morning He does not force himself to write He waits for the poems He has always done his best writing when living in isolated farm districts He enjoys taking long walks and likes to stop and chat with his neighbours

Louis Untermeyer another poet described Robert Frost as having a face carved out of native granite pale blue and quizzical eyes the quickly bantering smile a stubborn scholar s face masking the irrepressible poet s Others have described him as a stocky ruddy faced man with casual white hair and brambly brown eyebrows

Frost s poetry like his face is true to New England—true to its landscape its climate its morality its tongue 'He is a New England poet but his verse can be understood anywhere in any country Frost s country is the country of human sense of experience, of imagination, and of thought

One of his critics has said that if his poems are pressed they reveal a distrurbing indetermination and shallowness. Others have written that many of his poems are trivial or merely whimsical and that while the lyric vein runs pure and unchallengeable throughout the thought can be challenged at many points It is true that other contemporary American poets may have had greater influence—T S Eliot Ezra Pound W H Auden. Each, in various measures is said to have expressed more accurately the tumults of our time But when the time itself has passed into history it may well appear that Robert Frost poet of everyday life immaculately matching thought and image has chosen the more durable material.

***

HOW TO MASTER A SUBJECT BY STUDYING

By MARJORIE BOULTON M A

LEARNING a subject at school has the advantage that we receive regular instruction from practiced teachers who keep our noses to the grindstone

Learning a subject by ourselves needs much more self-discipline But it is more pleasurable in that we have chosen our own course of study and have a much more conscious, satisfying sense of adventure

So there are advantages on both sides

Since the person who is still at school automatically receives professional guidance this article is mostly for the older learner who is trying to master some subject without a time table and regular homework. But much of it will also be relevant to the work of the student at school or college

How should I study? Let us ask, first of all another question Why should I study? The best reason of all and the incentive which will keep us longest at our books is interest

I have just read an account of the finding of the coelacanth by the professor who made the discovery He thought more about fish than about any other subject His absorbed interest an interest so passionate that to others it must have seemed almost like an obsession led him to outstanding expert knowledge and finally to world renown

While we can encourage ourselves to be interested by adopting a cheerful, positive attitude to life and cultivating curiosity as a virtue it is difficult to produce eager interest out of the blue, as it were But by cultivating interest, we can make it grow

The second best reason for studying a subject is practical need. This probably means that we *shall never take the subject* on a high level but it is a strong incentive

Such a need arises when we learn a language in preparation for a trip to a foreign country learn a subsidiary subject which is a condition of some examination in our favourite subject attend a class on car maintenance in order to run a car more economically and safely

A less common but rather fine reason for studying some subject is in order to share someone else's *life more fully* My mother took a course in Esperanto in order to share my life more deeply, and has since received many unexpected rewards of friendship and interest

A wife who studies the subjects relevant to her husband's work or hobby will be a far better companion, more sympathetic, more *intelligent*

A husband could often win great appreciation from his wife by a similar sharing of interests Where personal love is a stimulus it may soon lead to real interest and absorption

One thing is certain to study with no end in view with no sense of purpose except when we are very young indeed and cannot yet see the point of much that we genuinely *need to learn (for example, the multiplication* table) is a futile occupation

Some people take refuge in meaningless study as an escape from real life It should be a means of enriching life No knowledge is useless that really satisfies our soul but the collection of useless knowledge can become a substitute for leading a full life

When we have asked why and are sure that our reason for studying our chosen subject *is strong enough to carry us through the* proposed course we can begin to ask ourselves "How?"

The answer will depend somewhat on the subject Chemistry history theology or driving a car obviously involve very mental operations, and the same rules need not apply to all the four subjects

Here however are some general hints for the student that apply to most

1 *Select material sensibly* Many students even experienced students, have no idea how to take notes or what to memorise They try to take notes of everything in a book, everything a lecturer says. Naturally in the end, they cannot see the wood for the trees

They try to learn every single fact or quotation by heart, then suffer torments of anxiety because all this will not go into one head Of course it will not! What are books for? We are not living in those primitive times when all knowledge had to be memorised

The wise student makes notes of those facts which it will be worthwhile to learn by heart, those salient facts that are constantly needed or that examiners may demand He will learn those facts by heart thoroughly

There is no need to learn explanations analogies allusions in a book or lecture once the student is sure he has understood the facts these explanations, analogies or allusions are clarifying

Often students remember some picturesque or comical little detail that is unimportant but forget an essential fact. We should under stand that the picturesque dramatic details that impress us will probably stay in our heads anyway and that the effort of learning should be directed to the dry bones of facts

Copying uncritically from books taking down lectures word for word (or as in my experience young learners so often do in a form that is so garbled it would horrify the lecturer) and then repeating these very words is no way to gain marks in an examination Also it is completely useless as mental train ing

It is foolish to waste time learning by heart facts that are easily accessible in a reference book, unless an examiner is likely to demand these facts—for many examinations are still very stupid

Unless they are wanted for such a purpose dates in history or the history of literature are not worth learning In science there is no point in learning the boiling points of a great many substances unless we are to use the information almost every day In langu ages it is absurd to waste our time mastering the irregular plurals of very rare words

Such things can be looked up when for some reason we need to know them

On the other hand the English student who thought Shakespeare was an eighteenth century author the chemist who could not remember the boiling points of water and al cohol or the interpreter who did not know the days of the week in his foreign language would be embarrassed and would make more mistakes owing to his ignorance

2 *Avoid long intervals* In general twenty minutes of study each day is worth much more than three hours study at the week end

There are subjects such as philosophy in which long periods of study are necessary But in most we can do a great deal in short periods It is surprising how much of a langu age or a science may be picked up in odd moments during our busy days

Most important, to abandon a subject com pletely for several days is to forget a great deal and to make the re starting difficult We have all experienced this on returning to school after perhaps a very short illness

It is as well to glance at our books daily for a few minutes even if we cannot do a proper spell of hard study This will help the mind to retain the facts learned, so that if we cannot make progress that day, we shall at least not slide backwards

3 *Proceed from the known to the unknown* This is a rule that all teachers learn When we meet some unfamiliar facts we should try to compare them with what we do know

In studying any subject we should not begin with too difficult a textbook. We should seek the best advice on a book for a beginner Even if we master the beginner s book very quickly and feel it is almost in-sultingly easy it will give us a good foundation on which to build our future knowledge A book intended for children will often give an adult a very good start in an unfamiliar subject

One rigid rule for the student should be Never go on to the next step in a subject until you are sure of the first step

It is worthwhile to spend a great deal of time and effort on acquiring a really firm grip on the essentials We can soon add to well digested knowledge but half understood facts are no use

4 *Hasten slowly* It will follow from this that it is possible to study too fast Speed comes as we continue This is especially noticeable in the study of languages and the acquisition of skill in crafts or something mechanical

It is best to start very slowly and not be impatient if we do not seem to be making much progress the first thing is to master the elementary knowledge A slow start may save a great deal of muddle later

Many people who take correspondence courses make the mistake of trying to go too fast They try say to prepare for an exami-nation in one year when they really need at their ideal speed of learning two years

Lessons seem to rain on them One lesson comes in before they have mastered the pre-vious one A short illness seems a catastrophic loss of time Tests grow worse and worse since nothing has been properly assimilated

And at last the student after much genuine misery decides that he is too stupid to take the examination.

In fact he might if he had allowed himself more time have taken the examination quite comfortably

Unless there is some overwhelming practical reason—an age limit a qualification for a good post which may otherwise be lost the possibility of a valuable prize—we should always give ourselves plenty of time for preparing for an examination

Cramming is no more beneficial to the mind than stuffing oneself with food however nourishing is good for the body We must also consider our own powers of assimilation.

5 *Us visual aids* We should make as much use as we can of pictures graphs diagrams and tables Often we learn a great deal by preparing our own. If we set out facts in tabular form the table often shows us relationship we had not noticed and not only helps us to remember the facts but also helps us towards useful generalisations

Pictures graphs, diagrams are often more impressive than words and help to fix in the memory the facts that they represent

6 *Seek help and ask questions* Steinbeck, in his beautiful short novel *Sweet Thursday* makes a wise worldly woman say 'There ain t nobody was ever insulted by a question and The nicest thing you can do for anybody is let him help you

There is a great deal of truth in this Most people are delighted to be asked about their own subjects Among students the abler student is pleased and flattered if a less able student asks for help

We should cultivate the society of people who are interested in the same subject and encourage discussion To talk about a subject is a good way to test our understanding of it as well as to learn more

Radio and television programmes on our subject will usually be attractively presented and the facts reliable It is worthwhile to look out for notices of public lectures and for articles in newspapers or magazines

Many learners are not sufficiently aware that there are periodicals connected with their subjects Especially in scientific and technical subjects but also in the arts subjects it can be dangerous to rely too much upon textbooks New discoveries and theories are constantly appearing and a textbook even a few years old may in places, be out of date

The student who takes out a subscription to some professional magazine on the subject will be kept in touch with the latest information

7 *Test yourself* The school child is often tested by the teacher The adult student must learn to test himself Working alone he has to be especially careful not to deceive himself that he knows something when he has merely read it over

How can a student test himself? He can close the book and try to write down the facts he has been trying to learn He can cover up portions of the book with his hand and check whether he remembers what he has just read. He can try to recollect the subject just studied when doing something else

Best of all two friends studying together can consolidate their knowledge admirably by testing each other

8 *Use knowledge as soon as possible* Obviously there is some knowledge that we cannot immediately put into practice But whenever we have the opportunity to use new knowledge in a real life situation we should take it

For example the person who is learning a language should take a trip abroad or meet some native of the country as soon as possible One who is studying history can visit some place where historical deductions are called for—such as a cathedral or castle or a museum

When we apply knowledge, we test its accuracy; we fix it more firmly in our heads and the gratification of success gives us more confidence to continue the effort to learn

All these tips are of use But only the individual student himself can advise himself on one final point. He should try to learn as much as possible about his own methods of study

Some people study best in the early morning a few late at night some in a library with others working around them others in solitude some have a very good visual memory, others more easily remember what they hear and so on

Each student will work more efficiently when he learns something of how his own particular mind works and can apply this knowledge to his methods of study

Study that is adapted to our own individual pattern is not only successful As the acquisition of knowledge should be It is a pleasure and the most exciting of all sports

(From *The Psychologist Magazine*)

INDIAN ATOMIC ENERGY PROGRAMME

By Dr H J BHABHA

THE five countries which are at present advanced in atomic energy namely Canada France U S S.R U K and U SA [1] are all industrially advanced countries with a developed technical background All of them except the U S S R, co-operated closely with each other in developing atomic energy during the war

While India is behind all these in atomic development and indeed has long way to go to catch up the most advanced among them its programme is nevertheless more developed than that of most countries in the world including some of the highly industrialized countries of Europe India is therefore, in unique position of being the only industrially under-developed country with an important atomic energy programme

This development has been made possible by the fact that India is a very large country with a population of nearly 400 million so that although its *per capita* production may be small its total production is quite considerable India is one of the largest producers of textiles in the world and in addition produces many industrial commodities like steel locomotives machine tools heavy chemicals and fertilizers which are produced in very few under developed countries This gives it a technical ability to develop on its own which is quite different from that of other under-developed countries Nevertheless whatever India may have achieved in atmoic energy has been achieved by a concentration of effort and resources by a selection of some of the best young scientists and engineers from all parts of the country and their concentration in one big research and development centre at Trombay where they can assist and stimulate each other and finally by a provision of the best available equipment. The Government of India has given atomic energy development a high priority and its full support Our atomic development has depended above all on the strong and continuous backing of the Prime Minister Mr Jawaharlal Nehru to whose faith in the importance of science and its practical application indeed all scientific development in the country owes so much

Competitive Cost

Since the peaceful and the military applications of atomic energy are so closely linked, assistance in many of the crucial steps leading to the use of atomic energy for generating electricity and to the production of some of the important materials required for an atomic power programme will only be given by other countries or by an international agency under conditions which would bring the Indian programme under international inspection and control Although the Indian atomic energy programme has no military component and it has been stated categorically by the Prime Minister on several occasions that we do not propose to go in for any such military programme an independent foreign policy and non alignment with any Power bloc makes the acceptance of inspection and control unacceptable to us as long as they are not applied universally to all countries alike in the interst of peace and international security It is therefore necessary for India to plan its entire atomic energy programme so that it can move forward if necessary without any external aid This does not mean that aid from friendly countries will not be accepted when it is given without any strings being attached and indeed we have received considerable help from several friendly countries some of which are mentioned later

A study of the economics of atomic power in India has shown that electricity from atomic energy would be competitive with electricity from thermal power stations in regions of the country remote from the coal fields which indeed include the major part of the country and many of its industrial centres The competitiveness of atomic energy in most parts of India is due to the operation of three factors namely, the location of its coalfields the limitations of the transport system and the general shortage of power in the industrial areas Eighty per cent of the coal used in India today is produced in the eastern corner in the States of Bengal and Bihar, and coal has to be transported some 1 500 miles to important areas in the north west and south such as Delhi Ahmedabad Bombay and Madras The true price of coal at these areas is therefore such as to make electricity from thermal stations more expensive than electricity from atomic power stations even today Secondly the railway system is already heavily loaded and has little

spare capacity A considerable increase in railway transport capacity will in any case be necessitated by the industrial development of the country thus involving an expenditure of large sums of money One third of all the goods traffic carried by the railway at present is coal, which is incidentally carried at a subsidized rate and therefore represents a burden on the economy The future development of electric power in a manner which does not involve a formidable increase in coal transport will therefore save the country large sums of money and a further capital expenditure on the railways. Finally power in industrial areas is so short that the grid systems as a whole have a very high load factor a situation which is necessary and favourable for the economic operation of atomic power stations. The Government of India therefore have under consideration the setting up of one or more atomic power stations in the period immediately ahead. If a decision to set up one were taken in the current year the power station would not be in operation till 1962, and atomic power would therefore only make a contribution during the third Five Year Plan It is however, necessary that we should embark on such a programme now in order to be able to take advantage of the developments in atomic power generation which are bound to take place in the next few years and thereafter

To instal a million kilowatts of net electrical capacity from atomic power stations during the third Five-Year Plan that is by 1965, is today entirely feasible technically and desirable economically Whether and to what extent such a programme will be embarked upon will depend principally on financial rather than economic consideration

Fifteen Years Goal

For all these reasons it has been decided to go ahead with a research development and production programme which will make possible the construction and operation of atomic power stations in India within the next ten to fifteen years

On the industrial side it is intended to produce within the country all the materials required for a full atomic power programme For this reason a start was made by setting up a plant at Alwaye in South India to treat the well known monazite sands on the west coast In addition to producing rare [illegible] and trisodium phosphate a cleaning material sold in the market this plant produces a cake containing thorium and uranium This cake is brought to the plant at Trombay near Bombay which produces a very pure thorium salt and also a uranium salt This plant was built by our own scientists and engineers and has been in operation since 1954 Its capacity increased sixfold last year

There has been designed a small uranium plant which will turn this uranium salt into reactor grade uranium metal and it is expected to have this plant in operation by the middle of 1958 This plant will give us enough uranium metal for experimental purposes and for use in the reactors that are under construction at present It will also give our scientific and technical staff the necessary experience for the design and construction of the large uranium plants which will be required by a full atomic power programme

A small plant for the fabrication of fuel elements has also been designed and its construction is being undertaken forthwith. Besides producing the fuel elements for our currently scheduled natural uranium reactors it will also enable research and development work to be carried out on new types of fuel elements and their canning

India is one of the largest producers in the world of the rare mineral beryl from which the metal beryllium can be obtained the present annual production being several thousand tons of high grade beryl Beryllium oxide may have interesting possibilities as a moderator and the metal or one of its alloys holds out great promise as a canning material A large pilot plant for producing atomically pure beryllium oxide of nuclear purity and sintering it into bricks is also being designed Its capacity will be about 15 tons of beryllium oxide per annum but it will be capable of expansion to several times this size Preliminary studies indicate that the cost of beryllium oxide produced in this plant will be lower than the cost at which it is being produced in Europe at present

It is also intended to produce heavy water in quantity and the decision was taken two years ago to produce heavy water and fertilizer together in a large plant which is being built at Nangal in the north This plant will produce over 340 000 tons of nitrogenous fertilizer annually and between 10 and 20 tons of heavy water Hydrogen for the ammonia plant will be made electrolytically The heavy hydrogen will be concentrated in the last stage

in the electrolysis cells which will be arranged in cascade The heavy hydrogen from these cells, wh ch will comprise between 20 and 40 p-r cent of the total stream, will be liquefied and the deuterium extracted by the hydrogen distillation process The plant has been placed at Nangal, so that it can draw cheap power from the dam at Bhakra It will consume 160 000 kilowatts of electric power and cheapness of power is essential for the economics of the pro cess It is estimated that by charging to heavy water only the direct costs involved in its produc tion the cost of heavy water will be about $ 20 per pound which is substantially lower than the present world price Production will commence in 1960 Several other large fertilizer plants are expected to be constructed during the second Five Year Plan and it is the inten tion of the Government to produce heavy water in all of them

Studies are also being made for the erection of a plant to make atomically pure graphite from the coke produced in a refinery in Assam Experiments which are under way at the Atomic Energy Establishment at Trombay have already shown that graphite of a high density can be produced by a method which is being tried

Zirconium is another metal which has promise as a canning material In order that it should be so used hafnium has at first to be separated from it and quite a good deal of research work has been done on the separation of hafnium from zirconium A process is now being tried out which is even more promising than the one reported by us at the Geneva Conference on the Peaceful Uses of Atomic Energy This method promises to yield metal lic zirconium free from hafnium in one step Zircon the mineral from which zirconium can be obtained is found as a constituent of the famous beach sands on the South West coast of India and is available in plentiful supply

Any country, which does not wish to depend wholly upon outside aid must have its own research and development organization not only for investigating the many possibilities which remain unexplored but also because even in fields where general knowledge is available practical experience and detailed know how are to be obtained The Atomic Energy Establishment at Trombay near Bombay which was formally inaugurated by the Prime Minister in January last year is Indias centre for research and development in the field of atomic energy

Research Activities

A layout of the entire Establishment has been prepared and some buildings completed while the construction of others will start very soon Some of the new laboratories will be ready early this year although all the buildings planned at present will not be ready till 1959 The Establishment is located at Trombay some 15 miles from the centre of Bombay The site of the Establishment which covers an area over 2 000 acres is completely separated from the rest of the industrial area of Trombay by Trombay Hill on its west Its eastern side lies on the upper reaches of Bombay Harbour

The research activities of the Establishment were however started without waiting for the new buildings to come up The Physics and Engineering Divisions were located in the Tata Institue of Fundamental Research at the Old Yacht Club building and in war time hut ments on its new site at Colaba A warehouse in another part of Bombay was converted for housing the Chemistry Division while the Biological and Medical Divisions were set up at the Indian Cancer Research Centre The total scientific and technical staff of the Esta blishment is now about 400 and it will increase to over 800 by 1959 By this time the total number of workers on the site including administrative maintenance and workshop staff will be over two thousand

To ensure a steady supply of trained scientific and technical personnel there has been started a training programme under which 250 young graduates and engineers will be recruited annually from the universities and given supplementary training for a year to fit them for work in our atomic energy programme The first course commenced in August last year with 170 trainees It is hoped to increase the intake of this school to 350 a year in due course

Apsara

Apsara India s first atomic reactor or the swimming pool type reached criticality for the first time on August 4 1956 It is the first reactor to go into operation in Asia out side the U S S R It was designed engineered and built entirely by our own people and by Indian industry except for the fuel elements The fuel elements which contain enriched uranium have been provided by the United Kingdom Atomic Energy Authority

The decision to build this reactor was taken in April, 1955 A firm decision on the

design was made in August 1955 and it took about one year to complete its construction

As soon as the decision to build the Swimming Pool Reactor was taken in early 1955, our attention was given to the next step of building a powerful high flux reactor for engineering research. Several different types were being considered when there was received a generous offer from the Canadian Government to set up a reactor of the NRX type in India The decision to proceed with the joint project was taken in August 1955, and the ground for it was broken in February 1956 This reactor is expected to be completed early in 1959 This reactor requires some 20 tons of heavy water which was sold to us by the United States Atomic Energy Commission

A short while ago it was decided to build a third zero energy reactor which will enable us to study the effect of different lattices shapes and sizes of fuel elements mixed lattices containing uranium or plutonium and thorium, and so on This reactor is expected to be in operation in 1958 also, and indeed it may be the second reactor actually to go into operation in India

The immediate need in many parts of India is for small power stations of about 20 megawatts and it is our intention to study for this purpose reactors moderated with beryllium oxide, gas cooled and working on natural or slightly enriched uranium. Since the critical size of beryllium moderated reactors is smaller than graphite moderated ones preliminary calculations show that they may well be more economical in the power range below about 20 megawatts For this purpose there has been for some years a joint project with the Commissariat a l'Energie Atomique of France for studying the properties of beryllium oxide as a moderator A small group at our Trombay Establishment is now actively engaged in feasibility studies on beryllium oxide moderated reactors of a power output below 30 megawatts.

The Indian atomic energy programme is of a very modest size, compared with the programmes in the United States the Soviet Union and the United Kingdom. It has no military component and one may recall on this occasion the words of the Prime Minister Mr Nehru, at the inauguration of the Trombay Establishment when he said "whatever might happen whatever the circumstances we shall never use atomic energy for evil purposes" Although the Atomic Energy Commission was established as an advisory body in 1948 in the Ministry of Natural Resources and Scientific Research, the work did not really develop until a separate Department of the Government of India with the full powers of a Ministry was established in August 1954 Since then the work has progressed very rapidly and the expenditure on atomic energy has grown about twelve fold within three years Only a modest beginning has been made which may greatly help to accelerate the industrialization of the country

—o—

OLYMPIC MOVEMENT IN INDIA

The organisation of athletic sports in India on country wide scale began in 1923 when on the eve of the eighth Olympics at Paris (1924) a provisional National Olympic Committee was formed The Committee organised the first All India Athletic meet which was held at Delhi in February, 1924

The first properly sponsored Indian team of seven athletes participated in the World Olympics in 1924 at Paris

At the time of the second National Athletic Championships held at Calcutta in 1927 the provincial representatives present for the meet decided to replace the provisional Committee by a properly constituted Indian Olympic Association

In 1928 at Amasterdam Olympics India won the world hockey title which she has retained till now

The Indian Olymic Association took over the responsibility of controlling and organising various sports in the country and held biennial Olympic Games from 1928 onwards.

A separate organisation for athletics known as the Amateur Athletic Federation of India came in to existence in 1946

The National Athletic Championships instead of being held every two years along with the Indian Olympic Games were made an annual feature from 1949 by the Federation

A beginning in Asian games was made in 1934 when the first Western Asiatic Games were held in New Delhi In 1951 they were replaced by Asian Games, the first meet again was organised at New Delhi

The second Asian Games were played at Manila (Philippines) in 1954 India stood fourth with five gold medals

THE FOREIGN EXCHANGE CRISIS

By J N MAHALANOBIS

THE acute shortage of foreign exchange with which this country is faced now could have been reasonably anticipated when the plan was formulated To be precise the weakest part of the plan related to foreign exchange position In spite of optimistic estimates a clear gap of Rupees 400 crores was left uncovered hoping that this would be covered by foreign aids and loans This gap has now very much widened due to increased imports both in value and volume It is true that during the first plan period substantial loans and aids were available from different sources particularly from U.S A and other world organisations but even assuming the same order of assistance would be available from the sources the deficit would remain Another mistake was that the deficit was calculated on the basis of 1955 prices but even in that year indications were available that the world prices were moving up especially in countries which would supply us bulk of the machines and other equipment for our capital projects and it would have been prudent to allow an increase of at least 25% in the price of imports on the basis of price trend observed during the last ten years It may be argued that the allowance for such price increase was not thought necessary as any increase in the cost of imports would be compensated at least partly by increase in the value of exports but this is a wrong assumption. It is true that during the years 1949 51 the prices of primary products shot up to a very high level, but that was an abnormal position created by Korean war And immediately after 1951, when the war fever disappeared the prices of all primary products exported from the country sharply delined An analysis of the prices of raw material and other primary praducts exported from under developed countries like India shows that the prices of these commodities tend to decline, compared to industrial products Throughout the history of international trade in the 19th and also in 20th century except during abnormal period such as war or hectic boom the terms of trade have always gone against the countries exporting primary products The Indian exports which even now mainly consist of raw materials and agricultural products also suffer from the same disadvantages It is not intended to say that all the problems could be foreseen in 1955 when the plan proposals were drafted but in regard to foreign exchange position a very realistic approach is necessary especially when a country has to implement an economic plan for a given period One may argue that the deficit in foreign exchange account may be largely wiped out by drastically reducing the imports of non essential articles as has been done down But the scope of restricting the imports of consumption goods in favour of capital goods is not very wide and any policy of drastic restriction of imports may create conditions which may affect the volume of exports and defeat the very objective of such policy

The prospect of further expansion of export trade in the near future does not seem to be very encouraging The main items of export consist of tea, jute oilseeds *cotton textiles and light engineering goods.* Our jute manufactures have to compete with the products of other countries including Pakistan and it seems now that within a few years time, the industry which enjoyed a monopoly position will have to face acute competition in world market. On the demand side also the position does not seem to be imporving The current expansion of world trade and commerce do not seem to have much effect on the demand for jute manufactures There are indications that the world market for jute manufacture is gradually shrinking In tea also the prospect of further expansion seems doubtful The tea industry enjoyed high prosperity in 1954 and 1955, but 1956 has not been quite a good year, even now the prices do not appear to indicate a firm trend In future, increased competition from other tea producing countries of the world may bring down the world tea price, and the value and volume of Indian tea exports may fall Indian Cotton Textiles are being exported in increasing volume to South East Asian countries and also to Middle East but the capacity of the consuming markets to absorb larger volume is limited and foreign exchange earnings on this account cannot suddenly increase even though a gradually increasing trend in the volume of export is probable over a number of years In other also

of large expansion is rather remote, except in the case of products of light engineering industries. The export trade in these items has increased remarkably within the last few years, and the scope of further expansion is very encouraging but foreign exchange earnings from this source cannot be so large as to appreciably help us to bridge the gap in our balance of payment account. All these analyses and comments are made not in a pessimistic vein to give a depressing picture but an attempt is made to highlight the difficulties that may rise in the sudden expansion of export trade. No one can reasonably expect that the world economic conditions would change so abnormally in near future as to force up the prices of primary products to a very high level. To be realistic, a further cut in the value and volume of our export does not seem quite improbable in view of the restrictive monetary policies already adopted in Great Britain and West Germany to curb the inflationary pressure. Even in U S A it is reported that during the last few months there has been a decline of 10% in business activity and stocks are accumulating. This by itself however does not mean that world is heading towards a depression but it is likely that for some time at least the hectic phase of business expansion may not be observed in U S A.

The position has been further aggravated by the fact that in almost all under developed countries the pace of industrialisation is being quickened. The demand is increasing at such a rate that it is beyond the capacity of the existing industrially advanced countries the number of which are only few such as U K, U S A and West Germany to meet this demand [illegible] machines and equipment even on a ca[illegible] basis and those who want on credit [illegible] tely at a disadvantageous position. R[illegible] ffered some help but the total [illegible] t of foreign assistance is so larg[illegible] it has not been able to relieve [illegible]. Besides Russia is even now [illegible] nstructing [illegible] own economy [illegible] scale a[illegible] ch she has [illegible] not b[illegible] in [illegible] of the [illegible] period. [illegible] transfers [illegible] present [illegible] to [illegible] vate [illegible] of

ket is considered not adequate for large investment. Besides U S investors find many new avenues of investment within or near their own country and do not like to lock up their money in distant places. The main source is to obtain loan or aids directly from U S Government. Such assistance has been available in the past and may also be received during the current plan period but the indications so far available do not show that the volume of such assistance would be so large as to appreciably relieve the pressure. U K had the tradition to lend heavily in foreign countries. Even now dividend income from foreign investment constitutes very important item of earnings but in the post war years her capacity to give large scale assistance has diminished. In spite of her difficulties some business firms agreed to supply machines and equipment on deferred payment system and this has been a very welcome help but in recent times her balance of payment position has so rapidly deteriorated that the Bank rate has been increased to 7%. Under such conditions no large scale assistance can be expected from that country till her economy is brought to a more even keel. West Germany's industrial power increased remarkably in recent years. She acquired such a quick prosperity that the West German Government is now trying to stabilise the value of mark by various restrictive monetary policies. If she gives us supply on credit the income and employment within the country would increase without any co[illegible]pensatory imports leading to further inflation. In view of the present economic policy of stabilisation any large measure of assistance from [illegible] country may not be expected, a[illegible] within a short period. Japan [illegible] ered some help but all these may [illegible] us substantially to relieve the [illegible] pressure. During the last [illegible] of international lending [illegible] ically disappear [illegible] 19th century and [illegible] al lending helped [illegible] of many countries [illegible] break-down of [illegible] and inter[illegible] and increased [illegible] ing countries [illegible] reasons which [illegible] ance of this [illegible] however two [illegible] ns have come [illegible]

Youth Welfare Programme In A Socialist Pattern Of Society

INAUGURATING the first Inter University Youth Festival held in November 1954, in New Delhi the Union Minister of Education and Scientific Research Maulana Abul Kalam Azad while underlining the importance of youth welfare had said

'There has been much criticism in recent times of our present day youth You will all agree that there have been instances of indiscipline and lack of ideals which are a cause for regret and shame Steps must be taken to check these evils but this cannot be done by mere commands or exhortations We must find out the causes of such unrest and take steps to remove them I am convinced that if the young are at times restless and turbulent it is not due to any intrinsic defect in them Their restlessness is largely due to the fact that they do not have enough channels for the expression of their youthful urges

'The problem of discipline must be looked at from the point of view of proper utilisation of the abundant energy of youth If youthful urges and energies are canalised and fields are found which will utilise all their enthusiasm and devotion there will be little occasion to impose restrictions from above Discipline must be achieved by giving proper direction to the energy of the youth and not by suppression

Realising therefore the need to direct the mighty reservoir of energy of Indian youth into constructive channels the Union Ministry of Education & Scientific Research, drew up a comprehensive programme for youth welfare work as far back as 1953

Main Objective

The main objective of this programme is to encourage youth in activities which develop character capacity for leadership and high qualities of head and heart For the development of an integrated personality capable of shouldering responsibility for effective citizenship it is essential to promote activities which stretch out to embrace every aspect of life physical and moral health intellectual emotional and social growth and cultural and spiritual advancement

A fuller development of the youth is possible only when they are provided with opportunities for self-expression in an atmosphere of freedom and under proper guidance This programme is therefore directed to complement the training at home, in educational institutions and in occupational employment If the individual is provided with wholesome opportunities to gratify his needs he will be able to act in a very desirable and constructive way thus bringing about an all round development of his personality Denied this his mind will remain unoccupied and the Devil s Workshop will function in the idle mind

The immediate programme for Youth Welfare was therefore so devised as to direct the leisure time activities of the young along pleasurable and worthwhile channels and provide greater scope for physical cultural and social activities

Programme

A countrywide programme for youth in all stations of life was too ambitious to be launched initially as a whole The approach to work therefore has been gradual The problems of college students called for immediate attention This is the body which has to provide leaders in the near future and it must be equipped for it It is also the body which is more full of life and can to an extent understand its own problems and work out their solution

Moreover contrasted with the large mass of youth in the countryside offices factories shops and domestic employment the college youth can be approached more easily through the University and college organisations Even though the major attention has been given to the students yet a beginning has already been made in regard to the programme for non student youth as well

In the implementation of this programme every attempt has been made to secure the co operation of the Universities and the State Governments for they are the agencies directly concerned with the problems of the youth The Central aid is therefore based upon the principle that the States and the Universities concerned should also share a part of the ex-

penditure. The main items of the programme under implementation are the following

Youth Leadership Training Camps

It has been accepted on all hands that in all kinds of youth welfare work for students the organisation and leadership should be in the hands of the teachers who are the natural leaders of the youth in their charge. This would arouse the staff to a greater sense of their fuller duties and would also help to bring about friendly co-operation and understanding between the two important groups—the teachers and the taught. Further it would prevent the exploitation of students by outside and unacademic organisations. In order to give useful directions to the teachers in guiding their students in various co-curricular activities the scheme of Youth Welfare includes the organisation of Youth Leadership Training Camps.

In these Camps the teachers are given short term training in the techniques of Youth Leadership and effective organisation of co-curricular activities and educational institutions. The problems of the youth are explained and solutions are suggested through talks and discussions by experts in different subjects on Youth Welfare.

Six such Camps have so far been organised directly by the Youth Welfare Section of the Union Ministry of Education & Scientific Research. The first Camp was held at Srinagar for selected members of the staff of the colleges of the Punjab University, the second at Mahableshwar for the Universities of Baroda, Bombay, Gujarat, Poona and Karnatak, the third at Caulatia (Ranikhet) for the Universities of Aligarh, Agra, Lucknow, Banaras and Allahabad, the fourth at Lovedale (Ooty) for the Universities of Madras, Andhra, Mysore and Travancore, the fifth at Darjeeling for the Universities of Calcutta, Visva Bharati, Gauhati, Patna, Bihar and Utkal and the sixth at Hyderabad for the [illegible] of Agra, Nagpur, Osmania, [illegible] Venkateshwara and Saugar.

Dramatic Training Camps

Training in the art of dramatic[illegible] given an important place in the [illegible] of work as dr[illegible] one of the m[illegible] cultural ac[illegible] our educa[illegible] titutions.

Three d[illegible] ca[illegible] ready been [illegible] at [illegible] ced at Salt[illegible] at Camps [illegible] to be

educative value and it has been felt that many such Camps should be conducted to cover all the colleges.

As it is not possible for the Centre to conduct the required number of camps it has been suggested to the Universities and State Governments that they may organise their own Camps for which Centre will give financial aid to the extent of 75% of the expenditure upto a maximum of Rs. 3,000/- for each project. The Universities of Jammu and Kashmir, Annamalai and Gujarat and the former PEPSU State Government have been given grants for holding such camps.

Educational Tour

Tours to places of historical importance, scenic beauty, cultural interest and big national projects have great educative value for the students. Government therefore provides facilities of travel to students for this purpose under a special scheme. Under the scheme, the Government of India gives 75% of the Railway or Bus fare at student's concession rate to small manageable batches of students going on educational tours. Since the inception of this scheme over Rs. 3 lakhs have been sanctioned to about 400 institutions and over 10,000 students have benefited from this assistance.

Youth Hostels

In order to provide cheap food and accommodation to the students while on tour it is intended to set up a network of Youth Hostels in the country. This work is carried out through —

(1) Youth Hostels Association of India, (2) State Governments and (3) Joint Projects by the Ministry of Education and Scientific Research and the Ministry of Transport.

The Youth Hostel Association of India is a private organisation engaged in encouraging Youth Hostels movement in the country. A[illegible] to the information available near[illegible] [illegible] Hostels are functioning in the [illegible] most of these buildings are [illegible] hed to colleges their use is limit[illegible] ture.

[illegible] ment of India gives financial [illegible] to meet the [illegible] for the construction [illegible] to a maximum of [illegible]

[illegible] India also proposes [illegible] Youth Hostels at [illegible] A tentative

BILINGUALISM IN EDUCATION

By SIR BEN BOWEN THOMAS

Though Wales is an integral part of Britain the people there are striving to revive and disseminate the language of their land—Welsh The problem is somewhat similar to India though in Wales people are concerned with only two languages—Welsh and English while in India the problem is more complicated as here we have thirteen indigenous languages in addition to Hindi to contend with English The author who is Permanent Secretary Welsh Department of the British Ministry of Education and is also the representative of the United Kingdom on the Executive Board of Unesco ably describes how Wales is trying to solve the bilingual problem.

WE hear so much today about Bilingualism in Education We cannot escape from it in Wales and in this experience we are not unique On the continent of Europe you have only to think of Belgium Holland Switzerland Yugoslavia and the states of the U S.S R. to realise how many countries are involved And if you go further afield there are the emerging nations of Africa and Asia all of which want to safeguard the position of their traditional languages and at the same time to equip their people effectively for the modern world

Nor is this a matter that exclusively concerns the smaller countries The so-called Great Powers whose language may be English Russian Spanish or French are increasingly realising that monolingualism no longer meets the needs of the present situation and that every intelligent citizen of the future should have a working knowledge of at least one other modern language besides his own—in the main, of course, one of the other major languages of the world Bilingualism is therefore inescapable for all but more so in some cases than in others In Wales it is a case of "Escape Me Never Something has been done about it for three generations or more and it is still a live educational issue

What do we mean by Bilingualism? It is the acceptance of the educational aim that if possible the average pupil in our schools should attain a mastery of his mother tongue and a working knowledge of the second language current within his society by the time he reaches his twelfth year and in any case by the time he reaches the end of his period of compulsory education

There is the general aim It has been set by successive Presidents of the Board of Education and Ministers of Education They have based it upon the fact that in Wales Welsh is the historic It honourable literary history of a thousand years it was a well-established and standardized language before English was though today English is the first language of two-thirds of the people of Wales

In this matter of bilingualism in Wales the Education Acts impose three duties upon the administrators in the Ministry

The first requires the promotion and development of the education of the people of Wales and the development of their institutions pre-eminent amongst which is the Welsh language For the last fifty years there has been no slackening in vigilance in this matter Two authoritative reports dealing with language teaching have been prepared at Ministers request and their recommendations have been strongly supported by the Ministry

Language surveys have been made so as to devise suitable ways and means of dealing with the children of every area in terms of their own conditions Hundreds of summer schools conferences and local courses have been arranged to help teachers to cope with problem of school organization and curricula Publishers have been stimulated to provide school readers the School Broadcasting Council for Wales has been helped in the preparation of its Welsh programmes and as a result of these efforts there has been a great improvement in the development of clear language policies by local education authorities in increasing the number of competent teachers of Welsh in improving school organization and in applying better classroom techniques

The second duty is concerned with the training of teachers There is no problem of numbers in Wales but there has been a problem of getting the right kind of teachers and of using them in Wales Training colleges have met both these needs increasingly In addition to earlier provisions courses of train

penditure. The main items of the programme under implementation are the following

Youth Leadership Training Camps

It has been accepted on all hands that in all kinds of youth welfare work for students the organisation and leadership should be in the hands of the teachers who are the natural leaders of the youth in their charge. This would arouse the staff to a greater sense of their fuller duties and would also help to bring about friendly co-operation and understanding between the two important groups—the teachers and the taught. Further it would prevent the exploitation of students by outside and unacademic organisations. In order to give useful directions to the teachers in guiding their students in various co-curricular activities, the scheme of Youth Welfare includes the organisation of Youth Leadership Training Camps.

In these Camps the teachers are given short term training in the techniques of Youth Leadership and effective organisation of co-curricular activities and educational institutions. The problems of the youth are explained and solutions are suggested through talks and discussions by experts in different subjects on Youth Welfare.

Six such Camps have so far been organised directly by the Youth Welfare Section of the Union Ministry of Education & Scientific Research. The first Camp was held at Srinagar for selected members of the staff of the colleges of the Punjab University, the second at Mahabaleshwar for the Universities of Baroda, Bombay, Gujarat, Poona and Karnatak; the third at Chaubattia (Ranikhet) for the Universities of Aligarh, Agra, Lucknow, Banaras and Allahabad, the fourth at Lovedale (Ooty) for the Universities of Madras, Andhra, Mysore and Travancore; the fifth at Darjeeling for the Universities of Calcutta, Visva Bharati, Gauhati, Patna, Bihar and Utkal and the sixth at Hyderabad for the Universities of Agra, Nagpur, Osmania, Annamalai, Venkateshwara and Saugar.

Dramatic Training Camps

Training in the art of dramatics has been given an important place in the programme of work as drama is one of the most important cultural activities in our educational institutions.

Three dramatics training camps have already been conducted one at Andretta, the second at Sabathu and the third at Matheran. These Camps have been found to be of great educative value and it has been felt that many such Camps should be conducted to cover all the colleges.

As it is not possible for the Centre to conduct the required number of camps, it has been suggested to the Universities and State Governments that they may organise their own Camps for which Centre will give financial aid to the extent of 75% of the expenditure upto a maximum of Rs 3,000 for each project. The Universities of Jammu and Kashmir, Annamalai and Gujarat and the former PEPSU State Government have been given grants for holding such camps.

Educational Tour

Tours to places of historical importance, scenic beauty, cultural interest and big national projects have great educative value for the students. Government therefore provides facilities of travel to students for this purpose under a special scheme. Under the scheme, the Government of India gives 75% of the Railway or Bus fare at student's concession rate to small manageable batches of students going on educational tours. Since the inception of this scheme over Rs 3 lakhs have been sanctioned to about 400 institutions and over 10,000 students have benefited from this assistance.

Youth Hostels

In order to provide cheap food and accommodation to the students while on tour it is intended to set up a network of Youth Hostels in the country. This work is carried out through —

(1) Youth Hostels Association of India, (2) State Governments and (3) Joint Projects by the Ministry of Education and Scientific Research and the Ministry of Transport.

The Youth Hostel Association of India is a private organisation engaged in encouraging Youth Hostel movement in the country. According to the information available nearly 115 Youth Hostels are functioning in the country. Since most of these buildings are Hostels attached to colleges their use is limited to the vacation time.

The Government of India gives financial assistance to State Governments to meet the 50% of the expenditure for the construction of Youth Hostels subject to a maximum of Rs 20,000 for each project.

The Government of India also proposes to construct a few model Youth Hostels at selected places in the country. A tentative

BILINGUALISM IN EDUCATION

By SIR BEN BOWEN THOMAS

Though Wales is an integral part of Britain the people there are striving to revive and disseminate the language of their land—Welsh The problem is somewhat similar to India though in Wales people are concerned with only two languages—Welsh and English while in India the problem is more complicated as here we have thirteen indigenous languages in addition to Hindi, to contend with English The author who is Permanant Secretary Welsh Department of the British Ministry of Education and is also the representative of the United Kingdom on the Executive Board of Unesco ably describes how Wales is trying to solve the bilingual problem

Nor is this a matter that exclusively concerns the smaller countries The so called Great Powers whose language may be English Russian Spanish or French are increasingly realising that monolingualism no longer meets the needs of the present situation and that every intelligent citizen of the future should have a working knowledge of at least one other modern language besides his own—in the main, of course one of the other major languages of the world Bilingualism is therefore inescapable for all but more so in some cases than in others In Wales it is a case of Escape Me Never Something has been done about it for three generations or more and it is still a live educational issue

What do we mean by Bilingualism? It is the acceptance of the educational aim that if possible the average pupil in our schools should attain a mastery of his mother tongue and a working knowledge of the second language current within his society by the time he reaches his twelfth year and in any case by the time he reaches the end of his period of compulsory education

There is the general aim It has been set by successive Presidents of the Board of Education and Ministers of Education They have based it upon the fact that in Wales, Welsh is the historic honourable literary history of a thousand years it was a well establ sh d and standardized language before English was though today English is the first language of two thirds of the people of Wales

In this matter of bilingualism in Wales the Education Acts impose three duties upon the administrators in the Ministry

The first requires the promotion and development of the education of the people of Wales and the development of their institutions pre-eminent amongst which is the Welsh language For the last fifty years there has been no slackening in vigilance in this matter Two authoritative reports dealing with language teaching have been prepared at Ministers request and their recommendations have been strongly supported by the Ministry

Language surveys have been made so as to devise suitable ways and means of dealing with the ch ldren of every area in terms of their own conditions Hundreds of summer schools conferences and local courses have been arranged to help teachers to cope with problem of school organization and curricula Publishers have been stimulated to provide school readers the School Broadcasting Council for Wales has been helped in the preparation of its Welsh programmes and as a result of th se efforts there has been a great improvement in the development of clear language policies by local education authorities in increasing the number of competent teachers of Welsh in imp oving school organization and in applying better classroom techniques

The second duty is concerned with the training of teachers There is no problem of numbers in Wales but there has been a problem of getting the right kind of teachers and of using them in Wales Training colleges have met both these needs increasingly In addition to earlier provisions courses of train

been established at two of our colleges and the Minister has asked the Welsh Joint Education Committee to encourage Welsh local education authorities to see that these qualified bilingual teachers should be employed in due course.

The third duty derives from the section of the Act that says that pupils are to be educated in accordance with the wishes of their parents. This is often referred to in connection with bilingualism.

In recent years the Ministry has approved the establishment in mixed linguistic areas of Welsh schools for Welsh speaking children on educational grounds.

The local education authorities have also made considerable progress both singly and collectively. Some have appointed language organisers; a few have stimulated the production of suitable school textbooks—and very good they are. Several have reorganised their schools in the interest of better bilingual teaching. This task is by no means an easy one where English and Welsh speaking people live together in the same communities and it is harder today than it would have been two generations ago. Where these communities are overwhelmingly Welsh-speaking or English-speaking arrangements can be simple and little change may be required. Welsh language primary schools or English language primary schools can be established and the second language—English or Welsh—can be gradually introduced when the child enters the Junior School.

But where the communities are very mixed in a linguistic sense other solutions become necessary. Sometimes all the children will enter the same school and then they will be classified on a language basis, the unity of the school being maintained through its acts of worship, social functions and games. In such schools the dominating language of the playground will be the ascendant one. The second solution in linguistically mixed areas may also involve the assembling of children of the minority language group from a wider area than is usual and concentrating them in one school. In this way Welsh language schools have appeared in recent years in city, town and urban areas.

Then there is collective action. For nearly ten years now the Welsh education authorities have worked through the Welsh Joint Education Committee. When it was established, the Minister of Education handed it amongst its [illegible] the review of questions arising from the curriculum of schools with special reference to the teaching of Welsh language and literature."

The stimulation of the production of Welsh books for schools has engaged the attention of the Joint Education Committee. For the last four or five years they have been able to stimulate such a supply by levying sums of money from the local education authorities so as to guarantee something like £16,000 a year for expenditure on Welsh books. The scheme enables the Welsh publishers to feel confident that books that they may publish will be purchased and thus the element of risk for them is reasonably curtailed.

And so we have both central and local governments playing their part to establish as fair a bilingual policy in the schools of Wales as is possible.

Fundamentally, it is the will of the Welsh people to survive and the fair provision of ways and means that will decide the issue. The result can be of far reaching importance. Only recently one writer in the magazine "Education" wrote: "If this policy can be carried through successfully it will have an importance beyond the frontiers of Wales. The Welsh crucible can yield results that might radically influence not only other bilingual countries, but the teaching of language everywhere."

(UNESCO)

THINGS THEY SAY

A happy childhood is one of the best gifts that parents have it in their power to bestow.

—*Mary Cholmondeley*

Good manners and good morals are sworn friends and fast allies.

—*Bartol.*

Give the rogue a taste of his own roguish methods (*Shatham prati shathyam*)

—*Marathi Proverb*

Experience shows that success is due less to ability than to zeal. The winner is he who gives himself to his work body and soul.

—*Charles Buxton*

The past cannot be changed. The future is yet in your power.

—*Hugh White*

Intelligence Test

(Below are given some questions to test quickness of your mind and intelligence. It does not matter, that you attempt all the questions. What matters is the time taken by you to find the correct answers. The whole paper should not take more than 30 minutes to a fairly intelligent person. Try now and find out.)

—QUESTIONS—

1 Below are given a few questions with their likely answers. Choose the correct answer to each question —

(i) Certain shopkeepers are called Ironmongers because

(a) They buy and sell scrap-iron
(b) They repair articles made of iron
(c) They sell articles made of iron

Underline the right reason

(ii) In order to be called a SQUARE a space must be

(a) Enlosed by four lines meeting at four right angles
(b) Enclosed by four lines all the same length
(c) Enclosed by four straight lines all the same length.
(d) Enclosed by four equal lines, all straight and meeting at four right angles

(iii) In order to be called a PROPHET a man

(a) Must be able to work miracles
(b) Must sell things for more than he paid for them.
(c) Must be able to foretell events in the future
(d) Must have been written about in the Scriptures
(e) Must be a good business man.

Underline the correct answer

(iv) The number 41 is called a PRIME NUMBER because

(a) It is under 100
(b) It will not be divided by 2
(c) It is an odd number
(d) Its only factors are itself and I
(e) It is not in any of the time tables

2 Read very carefully through the following at least twice and then answer the questions

Napoleon had strange misgivings that night. He had lost some of his old confidence. His generals noted that he did not eat much dinner in spite of there being roast duck his favourite dish. Besides he had a worried look and had fits of absent mindedness. By morning, however he seemed to have recovered. The prospect of battle steeled him and he was always at his best when action threatened. News was brought that Wellington was striking camp and making for a farm near Waterloo. Surrounded by his generals all young men Napoleon looked what he was—the master warrior. There was not a single man in the ranks who would not lay down his life for his Emperor and country. And this was what gave their leader renewed confidence as he gazed on their steadfast faces and read their inmost thoughts. Soon he came to a decision. The order to march was given. The English would be met at Hougoumount and Welligton crushed before Blucher and his Prussians arrived

(i) What was the matter with Napoleon before the battle ?
(ii) How did his generals know that there was something worrying their leader ?
(iii) When did Napoleon recover himself ?
(iv) When was he always at his best ?
(v) What news was brought to Napoleon?
(vi) Were his generals old or young men?
(vii) What gave him renewed confidence?
(viii) What 'decision did Napoleon make?
(ix) Where would the English be met ?

3 The words of the following sentences have been mixed up and one of the words removed and placed in brackets at the end. Choose this word from the three in brackets and write it down

(i) Wise takes man a it make a to time (for m [illegible])

(ii) Cowards many times before death their (live, die, birth)

(iii) The bed to nurse put the (child blanket medicine)

(iv) Paint when as will stick to one it (green white wet)

(v) A rain brings wind north east (never, when usually)

(vi) Live without could we not (charcoal, bread fish)

(vii) Go bed if healthy be to early must you wish (than, you I)

(viii) King the in lived old an (post office dungeon castle)

4 In a certain code the letter A is represented by O B by 1 C by 2 and so on Now write down the following words as they would appear in this code

(i) Fade (ii) High (iii) Cabbage
(iv) Feed (v) Beach.

5 Each of the following questions is answered by one of the phrases A, B, C, D, E, F, G H, I given below Answer each question by writing down the letter that stands before the suitable phrase.

(i) Punctuality means ?
(ii) Generous means ?
(iii) Dare means ? (iv) Hasty means ?
(v) Glare means ? (vi) Seldom means ?
(vii) Scarce means ?
(viii) Gorge means ?
(ix) Ladle means ?

A. Look at some one fixedly
B Dish out with a spoon
C. Do things in a hurried fashion
D Not very often
E. Eat a large quantity of food
F Being there at the appointed time
G. Being kind to people
H Risk a thing
I Not many

6 What arithmetical signs should be placed between each of the following to obtain the results given at the end ?

Example · 4 3 7 =49 Answer : (4+3)×7=49

(i) 4 5 7 3=13
(ii) 315 7 4=77
(iii) 21 1 825=847
(iv) 6 7 11 5=29
(v) 93 75 8=[illegible]
(vi) [illegible]

7 Arrange the following in the natural order

Example cher warm, hot . . . etc.

(i) Thursday Friday Monday Sunday Tuesday, Wednesday, Saturday (Begin with Sunday)

(ii) toe ankle waist knee neck head.

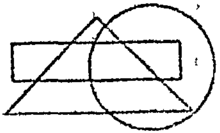
(iii) early very late, punctual very early, late

(iv) hour, second month year minute, day week

(v) long covet yearn wish, like

(vi) 4356 4354 3456 2345, 5446 5439

8 Several little wooden cubes each with an edge of one inch are put together to form a solid cube with an edge of three inches This big cube is then painted red all over the outside. When the paint is dry the big cube is broken up into the original little cubes Now answer these four questions about the little cubes



(i) How many cubes will have paint on four sides ?

(ii) How many cubes will have paint on three sides ?

(iii) How many cubes will have paint on two sides ?

(iv) How many cubes will have no paint on ?

9

(i) Write the letter A inside both the triangle and the circle

(ii) The letter B where it will be inside the oblong only

(iii) The letter C inside circle and oblong only

(iv) The letter D inside circle oblong and triangle

ANSWERS

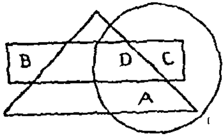
1 (i) c
(ii) d
(iii) c
(iv) d

2 (i) He had strange misgivings
(ii) He had lost some of her confidence
(iii) By meeting
(iv) When action was about to take place

- (v) That Wellington was striking camp and making for a farm near Waterloo
- (vi) Young
- (vii) Because he saw the steadfast faces of his men and could read their inmost thoughts
- (viii) To march and meet the English at Hougoumont and defeat Wellington before Blucher and his Prussians arrived
- (ix) Hougoumont

3 (i) Fool (ii) Die
(iii) Child (iv) Wet
(v) Usually (vi) Bread
(vii) You (viii) Castle

4 (i) 5034 (ii) 7867
(iii) 2011 064 (iv) 5443
(v) 14027

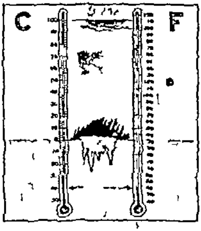


5 (i) F (ii) G (iii) H
(iv) C (v) A (vi) D
(vii) I (viii) E (ix) B

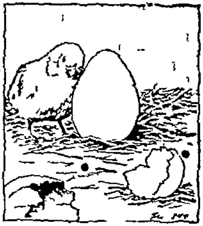
6 (i) 4+5+7−3=13
(ii) (315−7)−4=77
(iii) 21−3+824=842
(iv) 6+7+11+5=29
(v) SS+TS−S=SST
(vi) $\frac{1}{2}\times\frac{1}{4}\times\frac{3}{8}=\frac{3}{64}$

7 (i) Sun , Mon., T , W , Th F S
(ii) Toe ankle, knee, waist, neck, head
(iii) Very early, early, punctual late, very late
(iv) Second minute hour, day week month year
(v) Like wish covet, long yearn
(vi) 2345 3456 4354 4356 5439, 5456

8 (i) 0 (ii) 8 (iii) 12 (iv) 1



9 This is where the letters should go



DID YOU KNOW ?

More than 200 000 persons have fled to the West from Communist Hungary since the Hungarian Revolution in October November 1956

Forty degrees below zero is the only point at which the centigrade and Fahrenheit thermometers coincide exactly

Eggs set on their large ends will not hatch The air cell is located in that end, and the weight of the contents destroys it

(ii) Cowards many times before death their (live, die birth)

(iii) The bed to nurse put the (child, blanket medicine)

(iv) Paint when is will stick to one it (green white wet)

(v) A rain brings wind north east (never, when usually)

(vi) Live without could we not (charcoal, bread fish)

(vii) Go bed if healthy be to early must you wish (than, you I)

(viii) King the in lived old an (post office dungeon castle)

4 In a certain code the letter A is represented by O B by 1 C by 2 and so on Now write down the following words as they would appear in this code

(i) Fade (ii) High (iii) Cabbage
(iv) Feed (v) Beach

5 Each of the following questions is answered by one of the phrases A B, C, D, E, F G H, I given below, Answer each question by writing down the letter that stands before the suitable phrase

(i) Punctuality means ?
(ii) Generous means ?
(iii) Dare means ? (iv) Hasty means ?
(v) Glare means ? (vi) Seldom means ?
(vii) Scarce means ?
(viii) Gorge means ?
(ix) Ladle means ?

A Look at some one fixedly
B Dish out with a spoon
C. Do things in a hurried fashion
D Not very often
E. Eat a large quantity of food
F Being there at the appointed time
G Being kind to people
H. Risk a thing.
I Not many

6 What arithmetical signs should be placed between each of the following to obtain the results given at the end ?

Example 4 3 7 = 49 Answer $(4+3)\times 7=49$

(i) 4 5 7 3 = 13
(ii) 315 7 4 = 77
(iii) 21 3 825 = 842
(iv) 6 7 11 5 = 29
(v) SS TS S = SST
(vi) [illegible]

7 Arrange the following in the natural order

Example : close warm hot scorching, etc.

(i) Thursday Friday Monday Sunday, Tuesday, Wednesday, Saturday (Begin with Sunday)

(ii) toe, ankle, waist knee, neck, head.

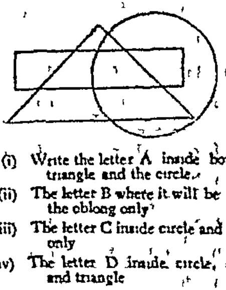
(iii) early, very late punctual very early, late.

(iv) hour, second month, year minute day week,

(v) long covet yearn wish, like

(vi) 4356 4354 3456 2345 5446 5439

8 Several little wooden cubes each with an edge of one inch are put together to form a solid cube with an edge of three inches This big cube is then painted red all over the outside When the paint is dry the big cube is broken up into the original little cubes. Now answer these four questions about the little cubes



(i) How many cubes will have paint on four sides ?

(ii) How many cubes will have paint on three sides ?

(iii) How many cubes will have paint on two sides ?

(iv) How many cubes will have no paint on ?

9

(i) Write the letter A inside both the triangle and the circle.

(ii) The letter B where it will be inside the oblong only

(iii) The letter C inside circle and oblong only

(iv) The letter D inside circle, oblong and triangle

ANSWERS

1. (i) c
(ii) d
(iii) c
(iv) d

2 (i) He had strange misgivings
(ii) He had lost some of his confidence
(iii) By morning
(iv) When action was about to take place

(v) That Wellington was striking camp and making for a farm near Waterloo

(vi) Young

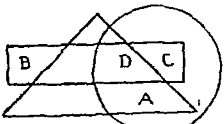
(vii) Because he saw the steadfast faces of his men and could read their inmost thoughts

(viii) To march and meet the English at Hougoumont and defeat Wellington before Blucher and his Prussians arrived

(ix) Hougoumont

3 (i) Fool (ii) Die
(iii) Child (iv) Wet
(v) Usually (vi) Bread
(vii) You (viii) Castle

4 (i) 5034 (ii) 7867
(iii) 2011 064 (iv) 5443
(v) 14027

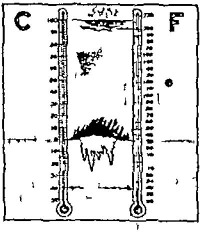


5 (i) F (ii) G (iii) H
(iv) C (v) A (vi) D
(vii) I (viii) E (ix) B

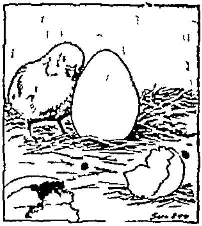
6 (i) $4+5+7-3=13$
(ii) $(315-7)-4=77$
(iii) $21-3+824=842$
(iv) $6+7+11+5=29$
(v) SS+TS−S=SST
(vi) $\frac{1}{2}\times\frac{1}{4}\times\frac{3}{8}=\frac{3}{64}$

7 (i) Sun, Mon, T W, Th, F, S
(ii) Toe ankle, knee waist, neck, head.
(iii) Very early, early, punctual late, very late
(iv) Second minute, hour, day, week, month year
(v) Like wish covet long yearn
(vi) 2345 3456 4354, 4356 5439, 5456

8 (i) 0 (ii) 8 (iii) 12 (iv) 1



9 This is where the letters should go



DID YOU KNOW?

More than 200 000 persons have fled to the West from Communist Hungary since the Hungarian Revolution in October November 1956

Forty degrees below zero is the only point at which the centigrade and Fahrenheit thermometers coincide exactly

Eggs set on their large ends will not hatch The air cell is located in that end, and the weight of the contents destroys it

STUDENTS' EMPORIUM

READING HABITS OF STUDENTS

Whatever other dissatisfactions and apprehensions have been caused by the actions and attitudes of the students of to-day there has been little room for complaint that their reading has suffered. I mean reading as a habit unconnected with lessons or examinations let us say more precisely the habit of having one's attention occupied by printed matter There is no doubt that present-day students—ranging in age from four to twenty—read a great deal what they read and why and whether their soul benefits or suffers by it is another question altogether Even our young children read more About four decades ago general reading was all but unknown But the student partook of a life at home in which the oral tradition of instruction and education was firmly rooted And thus the purely formal training of the school was well balanced by a very informal and almost unconscious absorption of classical and scriptural literature with a generous admixture of folklore proverbs and superstitions

Our immediate problems in education are vast and can be treated only on a mass scale But side by side with this must be examined the finer or more subtle problems of education the solution of which would alter not the content or method but the texture of our education the difference it would make would be like the difference between the mountain and the pyramid. One of them is child education For from the health and habits and mentality of the children of to-day will be born the attitudes and institutions of to-morrow

The read ng habits of students are another This question which is largely conditioned by the teaching habits of teachers includes both the study of curricular texts—a subject which would involve argument about the aims and purposes of education and its ideals and on which therefore only experienced educationists should give tongue—and the leisure hour and general reading of students In our country an evaluation of the latter—especially at this stage of linguistic sensitiveness involves questions of quality and availability In tackling this one problem alone we are about thirty years behind some western countries which having introduced and carried through a programme of country wide and compulsory education have been able systematically to take up the more ticklish problems connected with it Extensive studies have been made of the socio-psychological implications and physiology of reading habits as also of the reading interests and preferences of various age groups and data collected of rate, comprehension and speed of reading at different physical and mental levels Education has been made a subject of serious scientific study It is this kind of study which must be undertaken in our country Of course this would imply a readiness to think scientifically an attitude of mind which is inimical to the national temperament But a scientific approach can be at two levels—one the approach of a people whose temperament has been built upon and shaped by a mechanised civilisation, when it becomes almost an organic trait. It is the temperament which in its extreme form cannot think of an individul without automatically breaking him down to what has been called the spiritual sub-soil twenty four pairs of chromosomes and various chemical compounds held together by the homeostatic principle The second and more elementary and expedient type of scientific approach is scientific only in the sense of being statistical and categorical. It is the approach to a problem which has to be dealt in bulk and which has to be divided into manageable classifications On the subject of reading habits of students, for instance it is the effort to analyse in a general way the urges and motivations which drive and drag students to books and by syllogistic reasoning to arrive at various common denominations Large countries with rapidly increasing populat ons have to adopt this method.

What do our students read beside their texts book? What are the kinds of books they are interested in and what decides their taste? Student life ranges on an average between ten to fifteen years. These years constitute physically emotionally and psychologically, three distinct periods in a student's life Very young children like books of stories

bound in bright wrappers and illustrated and printed in elementary colours—animal stories, nature tales of a fanciful and fantastic nature and simple fairy tales—Panchatantra Cinderella, Snow White and Peter Pan and Tarzan almost in that order Boys and girls from say ten to fourteen at a general estimate de mand a certain degree of realism in their stor ies that is, adventures even of an improbable nature but happening to men and women of flesh and blood the exciting doings of Boy Scouts and Girl Guides tales of partiotism and heroism and stories of school and home life This is the age when every year in creases the reading and assimilation capacity of the young student and widens his and her interests Richmal Crompton Mark Twain R. L. Stevenson Deniel Defoe, Angela Brazil Susan Coolidge and Lousia M Alcott, Harriet Beecher Stowe are eagerly read during this time

Boys also read mystery and detective stor ies and become seriously interested in sports and develop a sense of humour and delight in puns and crack obvious jokes Young girls in their early teens especially coming from con servative middle class families become avid readers of stories in vernacular week end magazines The inhibited attitude of many of our young girls to sex and their ideas about the travails and adjustments of marriage and maternity are probabally derived from this reading It is at this early teen age level that a diversity begins to be apparent between the tastes of boys and girls Girls linger in Mrs Henry Wood Marie Corelli, Hardy Mazo de la Roche for a year or two after boys have moved into sports Conan Doyle, science fiction bio-graphies and war stories

It is only towards the end of their college life that boys and girls come together again in a passion of admuration for James Hilton Pearl Buck A. J Cronin, Maugham Hemingway, Upton Sinclair Roestler, Priestley and Huxley About this time too or perhaps some time within two or three years after college are read Jules Verne, D H Lawrence Oscar Wilde Rebecca West the Webbs Shaw Dostoievsky and H G Wells At some stage or other in their teen age and not seldom thro-ughout that period all students are attracted to writings about sex

This can only be considered a fairly general grading of reader interests which prevailed till a decade ago in English medium schools and colleges But, as may be understood any effort at detailed classification of child-hood and youth must provide for a variety like adolescent uncertainties availability of books home backgrounds social contacts and economic status influence and alter widely this general grading The students educatad only in the vernacular have not yet got any-thing even approximating the minimum of reading material which should be available in schools and colleges for general reading English—and I do not mean England—pos sesses a huge volume of literature There is in it something to suit the taste and inclination of every age from six to six ty Even after we have built up a wide variety of reading material in our vernaculars we must continue to make English books available to the people through translation The programmes and plans for extensive translation which are being made must not be considered interim plans a device to bridge the time gulf between the disappear-ance of English and the emergence of a national literature

In dealing with the reading habits especial ly of young people the very first fact which has to be understood is the potentiality of the printed word The printed word has a hypnotic quality about it It can influence beliefs attitudes morale public opinion, voting and anti social behaviour It can unite people by emphasising common interests and traditions and ideals or cause rifts in the social fabric by overstressing differences It is a powerful and potent instrument for moulding the thoughts of the young A book can break down psychopathic defences, which no amount of parental moralising can do So the message carried by the printed word strikes the young mind at its most vulnerable moment when it is relaxed and receptive

The mind of the student is like blot ting paper It can absorb absorb and absorb anything that is fed in to it But it has very little taste and its sense of judgment is not quite developed There is not a college boy or girl now, for instance who does not believe that all books which have been produced into films are great litera ture The student s mind when he is ready to leave student life is like a patchwork quilt of undigested ideas and scattered me mories

It need not be so. And this as you will agree I am sure is where the teacher comes in So perhaps we might with bene-fit undertake research into the reading habits first of teachers themselves.

(By *Mrs Santha Rungachari*)

THE UNION PUBLIC SERVICE COMMISSION

To many, the Union Public Service Commission means little more than an agency which puts forth regular advertisements in all the leading newspapers for 'Situations Vacant' and for competitive examinations held by it for recruitment to various posts This explains why on every Saturday thousands of educated young men both employed and unemployed scan the papers avidly for the notices of the Commission

Under India's Constitution however, the Union Public Service Commission discharges a much more imposing array of functions than meets the common eye It is a statutory body independent of the executive and the legislature, charged with the duty of recruiting staff for all civil services and posts under the Union Government, and for advising it on the methods of recruitment and the principles to be followed in such matters as appointments promotions and transfers Subjects like discipline among the Government servants claims in respect of persons who are serving or have served the Government and the award of compensation for injuries sustained by an employee while on duty also fall within its sphere of responsibility (It is obligatory for the authorities to consult it on these questions) Each year the UPSC submits a report of its work to the President, who places it before Parliament for discussion along with a memorandum of cases if any, where the advice of the Commission has not been accepted by the Government

In recent years the work of the Commission has remarkably increased This has been occasioned by the needs of a planned economy and the requirements of the welfare state in the making The following account of the UPSC's activities in 1956 57 may serve as an illustration

It held 25 examinations for which 60 000 application were received more than 44 000 candidates appearing for the final tests The various departments of the Government notified it of 2,800 vacancies for which 14 000 candidates were summoned for interview about 10 000 actually appeared and 2,570 were finally recommended for appointment The Commission also examined over 1 700 cases relating to promotions transfers and disciplinary action

Constitution

The U.P.S.C consists of eight members (including the Chairman) who are appointed by the President for a term of six years or until they attain the age of 65, whichever is earlier It is assisted by a fairly large secretariat

The members can be removed from office only for misbehaviour proved by a Supreme Court enquiry The Constitution ensures that they act independently and are immune from all possible influences and temptations With the latter object in view, it has been laid down that, on ceasing to hold office, no member shall take up any employment under the Government, except as chairman of some commission provided he has not crossed the age limit of 65

The UPSC makes good use of the interview method for choosing the best human material In the words of one of its members this method consists of a purposeful and well-directed conversation on a topic of choice in an attempt to discover the experience the skill and the intelligence of the candidates

In constituting its selection boards, the Commission has evolved a system by which it freely draws upon the knowledge and experience of persons of high status in various fields Such boards usually consist of at least one member of the Commission, a representative of the department concerned, and one or more official or non official experts called Advisers They assess each candidate's professional attainments, power to think logically and coherently ability to take practical decisions integrity and capacity for leadership and initiative

(*Raj Narain Gupta in Illustrated Weekly of India*)

GUIDE TO CAREERS THE ACCOUNTANT

An Accountant's Work is to handle and maintain accounts and examine and interpret their meaning in terms of profit and loss Many types of accountants are employed in offices and concerns as well as engaged in private practice There are junior accountants preparing and handling invoices balance sheets periodic statements vouchers and performing other routine jobs Important and difficult financial transactions and returns are handled by senior accountants who also devise and install accounting systems prepare complicated tax returns render advice on financial matters and report on the financial condition of the business Accountants inspecting financial records securities inventories etc kept by other accountants are

known as auditors and their job is to detect possible defalcations and other irregularities

Accountancy involves considerable mental work and a beginner may often find the work tedious and uninteresting The work at times is confining and strenuous At the end of a financial year, it is quite normal for an accountant to work under high pressure for continuous long hours An auditor has also to be out on tour for a few days every month

Personal Qualities necessary for the job are a natural aptitude for figure work combined with speed and accuracy in simple arithmetical calculations an analytical and enquiring mind a good memory legible handwriting and sufficiently good eyesight to read figures correctly and instantly An accountant should be willing and able to put in long hours of routine clerical duties without sacrificing thoroughness and accuracy

To rise to higher posts in the profession an accountant must in addition possess good judgment and be resourceful mentally alert, honest and incorruptible Other essential qualities are the possession of a pleasing personality to inspire confidence and trust a keen business sense, vision and imagination and the ability in talking or writing to express oneself in clear and simple but forceful language In brief to be worthy of advancement in this profession an accountant has to be a man of character, ability and industry

To Qualify for the better jobs, a person has to obtain a bachelor s degree or the National Diploma in Commerce, although at times experience is substituted for part or whole of the formal training

It takes four years after matriculation to qualify for the degree Studis can be under taken in any Arts or Commerce college offering courses in commerce There are also some colleges which prepare students for the National Diploma in Commerce awarded by the All India Board of Technical Studies in Commerce New Delhi The duration of the course for matriculates is four years but those who have passed intermediate (commerce) or equivalent examination or are graduates may be admitted direct to the second year This diploma is for many purposes regarded as equivalent to the B Com degree of Indian Universities

Some State Governments (for instance West Bengal Bombay Madras and Delhi) also award diplomas in Commerce which are recognised as equivalent to the intermediate examination for purposes of admission to B Com classes

The Indian Merchants Chamber, Bombay conducts an examination in commerce accountancy business organisation etc The Chamber has no teaching or supervision arrangements but some private institutions are recognised for its examinations Those who have studied at a recognised institution and have been working in a commercial or industrial firm for at least two years are eligible to take the examination

Subjects of study for the degree course include English economics, business methods and commercial correspondence commercial mathematics, commercial geography bookkeeping auditing accountancy banking and currency etc

The Cost Of Training varies from Rs 6/ to Rs 10/ per month as tuition fee for the Intermediate course and from Rs 8/ to Rs 12/ per month for the Degree course Living expenses involve an additional expenditure of Rs 40/ to Rs 80/ per month according to the place and manner of living

Future Training can be undertaken by qualifying for the membership (A C A) of the Institute of Chartered Accountants of India The members of the Institute who are in practice are known as Chartered Accountants ' To become a member of the Institute one has to undergo practical training under a member of the Institute and pass the Institute s examination Those who are above 16 years of age and have passed the Intermediate University (or equivalent) examination and the Preliminary examination of the Institute or who are graduates are eligible for admission as articled or audit clerks under a member of the Institute permitted to train such clerks On their serving as articled clerks for a period of four years or as audit clerks for a period of eight years and on their passing the Intermediate and Final examinations of the Institute, and on their fulfilling certain other conditions they are eligible for admission as Associate Members of the Institue These examinations are generally held every year in May and November, in all important centres of the country The Institute provides compulsory postal tuition to the articled and audit clerks An Associate can become a Fellow (F C A) after five years of continuous practice of the profession of accountancy as an Associate For sound and scientific management of industries a course in management and industrial accounting is also proposed to be started by the Institute for its members

Persons who wish to qualify for the posts of cost and works accountants, have to prepare for the examinations conducted by the Institute of Cost and Works Accountants Calcutta There are three classess of membership viz Studentship Associateship and Fellowship Candidates for studentship must have passed or been exempted from the Institute s Preliminary examination which is a test in general educational subjects Exemption from the Preliminary examination is granted to those who have passed the Matriculation or equivalent examination Student members must normally pass the *Final Examination within five years* of registration and within three years of passing the Intermediate Examination

To qaulify for Associateship (designation A.I C.W.A)persons must have attained the age of 21 years passed the Institute s Intermediate and Final Examinations and must have had at least three years practical experience of Cost Accountancy Candidates for Fellowship (designation F I C W A.) must have attained the age of 26 years must have been Associate for five years and must have held a position as Chief Cost Accountant or equivalent position for a like period

Preparation for chartered and cost accountancy can also be completed at home *through correspondence* courses

Openings for accountants are available in Government and Private offices industrial and commercial concerns banks insurance companies and local bodies There are jobs for accountants in every city and in all offices big or small Experience and training in accountancy is a very good preparation for many other excutive and administrative jobs in banks and insurance companies Under the Indian Companies Act the members of the Institute of Chartered Accountants alone can be appointed as auditors of companies They can also practise as income tax practitioners under the Indian Income Tax Act and are entitled to be appointed as Liquidators Administrators, Receivers Trustees, Executors, Custodians Arbitrators Advisors on costing and financial matters, etc

Entry Into The Service is usually at a lower level as a junior accountant assistant accountant or a junior auditor The rise to higher posts is usully possible after gaining a few year s experience Employment can be secured through an Employment Exchange, in response to an advertisement, or as a result of personal contacts with private firms and employers

Prospects For Advancement to higher posts are rapid for accountants with better educational qualifications ability and experience Persons with inadequate training often continue for long periods on routine jobs with little chances of promotion Those who can obtain additional qualifications in cost and chartered accountancy, banking, business administration, law etc., have better chances of employment and advancement in life Higher paid posts are usually filled through promotions within an office or in the case of Government vacancies through the State and Union Public Service *Commissions*

Accountancy presents a vast field and those with required qualifications and aptitude can aspire for the highest posts, provided they can prove their ability

Salaries of accountants vary according to the type of employer and qualifications of an individual as well as with the importance of the work performed Accountants employed in Central Government offices draw the following scales of pay —

Junior Accountant/Divisional Accountant	Rs	133-10-250-EB-15 355
Senior Accountant:	Rs	200-15 380-EB-30-800
Assistant Accounts Officer	Rs	500 30 800

The chartered accountants and cost accountants usually occupy highly paid positions in the field of accountancy

EMPLOYMENT OUTLOOK

The Government business and industry are drawing upon accountants more and more for planning and executing their financial affairs and programmes The present day complex tax systems improved methods of computing costs and controlling budgets the new fields of management accounting and innovations in accounting methods have increased the importance of this profession

Accountancy is a common and vast profession which is fairly crowded at the bottom with inadequately trained persons But there is an acute shortage of well trained and experienced accountants in all spheres of modern economic activities And for outstanding persons with experience and advanced studies in accountancy, there is a wide field for advancement to senior executive position in Government and business concerns

GENERAL KNOWLEDGE TEST

Test your knowledge Solve the following questions without any extraneous help When finished, look up for the answers and compare Try and see

QUESTIONS

1 What are the powers of the Indian President?

2 Write notes on
The recommendations of the (i) Sanskrit Commission and (ii) the University Grants Commission and on the findings of (iii) Chagla Commission.

3 What office do the following hold?
(i) Khruschev
(ii) Morarji Desai
(iii) Hafiz Mohammed Ibrahim
(iv) K L Shrimali
(v) Humayun Kabir
(vi) Phumiphon Aduldel
(vii) Leopold Gigl

4 Answer the following questions

(i) What status has Uganda in the Commonwealth?

(ii) What is the correct title of the Soviet Russian Premier?

(iii) What are the four freedoms as proclaimed by the late President Roosevelt?

(iv) Who said 'When two Englishmen meet their first talk is of the weather'?

(v) Which of the following are insects spider ladybird centipede ant and scorpion?

(vi) What is or was the Benefit of Clergy?
(vii) What is the opposite of homogeneous?
(viii) Which modern vessel is called the Nautilus?

5 Give the dates of the following —
(i) Birth of Jesus Christ
(ii) Death of King Harsha Vardhana
(iii) Signing of the Magna Carta
(iv) Defeat of the Spanish Armada
(v) Deposition of Shahjehan by Aurangzeb.
(vi) Battle of Waterloo
(vii) Dandi March by Mahatma Gandhi
(viii) Re-organisation of Indian States

6 Where are the following?
(i) D D T Factory
(ii) Hindustan Cables Ltd.,
(iii) Integral Coach Factory
(iv) Indian Telephone Industries Ltd,
(v) Machine Tools Prototype Factory
(vi) National Instrument Factory

7 Name the following —
(a) The planet
(b) The lightest element
(c) The hardest stone
(d) The heaviest liquid
(e) The return of the rays of light from a polished surface

(f) The change in the direction of ray of light, when it passes from a rare to a denser medium

(g) The relative weight of a substance as compared with that of an equal volume of water

(h) The Instrument which measures atmospheric pressure
(i) The two branches of Biology
(j) The science of weather and climate

8 What flaws in speech or writing are indicated by the following epithets —
(a) Redundant (b) Pedantic
(c) Rigmarole (d) Bombastic
(e) Slipshod

9 Write short notes on the following
(a) Atomic Energy
(b) Antibiotics
(c) Capillary Action
(d) Radar
(e) Hormones

ANSWERS

1 (1) He is the executive head of the Government of India All executive actions are taken in his name

(2) The Supreme Command of the Defence Forces is formally vested in him

(3) He can summon prorogue address and send messages to the two Houses of Parliament

(4) He is vested with the powers of appointment

(5) He gives assent to Bills passed by Parliament

(6) He can grant pardon, suspend remit or commute sentences in certain cases

(7) He can issue ordinances during the recess of Parliament

(8) He has the power to declare war or make peace

(9) He can declare a state of emergency arising due to

(a) War (b) external aggression (c) internal disturbances (d) failure of constitutional machinery in any State (e) threat to financial stability or credit of India.

2 (i) The Sanskrit Commission recommended the compulsory teaching of Sanskrit in all secondary schools and suggested a modification of the three language formulae for this purpose About the system of teaching the Commission says the traditional *pathshala* system should be preserved and revitalised and considers it premature to integrate it with the university system The Commission has *recommended creation of Sanskrit* universities in different areas to upgrade the traditional system of Sanskrit education In its general recommendations the Commission says that Sanskrit should be declared an additional official language

(ii) The first report of the University Grants Commission was presented to the Lok Sabha on March 3 1958 The report deals with the period December 1953 to March 1957

Dealing with the higher education in the country the Report says that the need of the day is consolidation rather than expansion An attempt has to be made to secure a right balance between the humanities the social and the natural sciences and the professional and technological courses But the primary concern at present is the improvement of standards and facilities

The Commission has given the highest priority to the improvement of the teachers salaries both at the university level and in the affiliated colleges About students welfare it has given thought to the problem of indiscipline among students and has undertaken a number of steps to improve the position

(iii) The transaction resulting in the purchases of shares of all companies by Life Insurance Corporation was not entered into in accordance with the business *principles* and was also opposed to propriety on several grounds

3 (i) Premier of Russia and the first Secretary of the Communist Party

(ii) Minister of Finance (Govt of India)

(iii) Minister for Irrigation and Power (Govt of India)

(iv) Minister of Education (Govt. of India)

(v) Minister of Scientific Research and Culture (Govt of India)

(vi) King of Thailand.

(vii) Foreign Minister of Austria

4 (i) Uganda is a Protectorate, not a Colony

(ii) The correct title of the Soviet Russian Premier is 'Chairman of the Council of Ministers of the U S S R.

(iii) President Roosevelt proclaimed the following four Freedoms

1 Freedom of Speech and Expression
2 Freedom of Religion
3 Freedom from Want
4 Freedom from Fear

(iv) When two Englishmen meet, their first talk is of the weather ,, occurs in ' The Idler by Samuel Johnson.

(v) The ladybird and ant are the insects

(vi) The Benefit of Clergy was originally the privilege of exemption from trial by a secular court of clergymen arrangned for felony They were handed over to an ecclesiastical court. This was applied in England to all these who were able to read—a verse of the 51st Psalm was used as test piece and ultimately even the reading test was omitted The privilege was abolished in 1827

(vii) The opposite of homogeneous is heterogeneous

(viii) Nautilus is the world's first atomic powered submarine built by the United States Navy

5 (i) 4 B C. (ii) 647 A.D
(iii) 1215 A.D (iv) 1588 A.D
(v) 1658 A.D (vi) 1930 A D
(vii) 1956 A D (1st November)

6 (i) Delhi.
(ii) Rupnarampur in the district of Burdwan (West Bengal)
(iii) Perambur (M

(iv) Krishnarajapuram Railway Station (Bangalore)
(v) Ambernath —near Bombay
(vi) Jadavpur (Calcutta)

7 (a) The Earth, Venus Mars etc
(b) Hydrogen (c) Diamond
(d) Mercury (e) Reflection
(f) Refraction (g) Density
(h) Barometer, (i) Zoology and Botany (j) Meteorology

8 (a) Use of superfluous words
(b) Show of learnings
(c) Beating about the bush
(d) Using big words
(e) Leaving many things unsaid

9 (a) *Atomic Energy* When the nucleus of a heavy element, e g Uranium 235 is bombarded with neutrons it undergoes fission or splitting up, and a huge amount of energy is released in the form of heat and radiation This is known as the atomic energy

(b) *Antibiotics* It is a branch of medical science dealing with the prevention and cure of diseases by bacteria The first antibiotic drug Penicillin, was discovered by Fleming in 1929 Latest effective drugs are Streptomycin and Aureomycin

(c) *Capillary Action* When a very narrow tube is immersed in a liquid the liquid rises in it due to surface tension This process is known as capillary action Capillarity is responsible for the upward motion of water in muslin or similar fabrics and the ascent of sap in the stems of plants

(d) *Radar* Radio Detection and Ranging or Radar originally known as Radio location was developed by British Scientists during the Second World War It is a method of detecting and positioning objects especially enemy planes by means of reflected radio waves of very high frequency

(e) *Hormones* are chemical substances produced by certain organs which enter the blood stream and act on other organs different from those in which they are produced Hormones control growth maintain health and help the nervous system

POULTRY FARMING

Though the importance of poultry as a subsidiary industry has long been realised in India, poultry development has been rather slow

In India an average indigenous hen produces about 50 eggs a year as against 120 produced by an average improved bird

The incidence of diseases such as Ranikhet, Fowl pox and Spirochaetosis has told heavily on the development of the industry An effective vaccine recently evolved has somewhat improved prospects to help averting casualities from these diseases

Since 1955 56 the development of poultry is receiving special attention During that year a pilot scheme, as a preliminary to the adoption of a comprehensive poultry development scheme was launched and 33 centres set up

On the basis of the experience gained by conducting these pilot projects an All India Poultry Development Scheme was formulated under the Second Five Year Plan

This Scheme aims at establishing five regional farms and 300 demonstration and extension centres at a cost of Rs 258 10 lakhs The regional farms alone will entail an expenditure of Rs 41 20 lakhs which will be met by the Central Government

The primary function of a regional farm is to maintain acclimatised stocks and supply day-old chicks to the States for setting up poultry extension centres It also serves as a Centre for the training of personnel required for manning the extension centres and poultry development blocks

A demonstration unit is proposed to be attached to each extension centre On these demonstration units training is to be provided to private poultry breeders in modern methods of poultry rearing A defertilization unit is to be attached to each extension centre for processing locally produced eggs in order to prolong their keeping quality

(*Continued from page 380*)

Bachelor s degree in Engineering or Technology with at least three years teaching practical or research experience They should be below 35 years of age

Application forms and further details can be had from the Ministry of Education and Scientific Research Scholarships Division (Section S-18), New Delhi

The last date for the receipt of applications is May 10, 1958

University FORUM

INDIAN SCHOOL OF MINES AND APPLIED GEOLOGY, DHANBAD

In a written reply to a question regarding the expansion of the Indian School of Mines and Applied Geology Dhanbad Dr M M Das Deputy Minister of Education and Scientific Research said in the Lok Sabha on March 17 that a scheme of development of the Indian School of Mines and Applied Geology Dhanbad had been formulated which provided *inter alia* for the expansion of facilities for Mining Engineering studies and institution of new courses in Petroleum Technology and Applied Geophysics

The annual admissions to the School he said were also proposed to be increased to 150 The estimated cost of the scheme was about Rs *134 46* lakhs

The total number of applicants and the number of students admitted during the last three years were as shown below

Year	*Total number of applicants*	*Total number admitted*
1955	*1 006*	52
1956	1,263	112
1947	*2,257*	*169 (including 19 students* admitted in the 2nd year of the Applied Geology Course)

Asked about the method of selection of the students for admission into the institution Deputy Minister replied that the admissions were made on the basis of an entrance test

REORGANISATION OF SECONDARY EDUCATION

In a written reply to a question whether the Governments of Bombay Uttar Pradesh Orissa and Punjab had taken a final decision about the new system of Secondary Education D K.L. Shrimali Minister of Education laid the following statement on the table of the Lok Sabha on March 28

Punjab The State Government have decided to introduce the new system of Secondary Education with effect from the academic year starting from April 1 1958 Regulations have been framed by the University and the State Government have agreed to these with the proviso that the change-over should be staggered over a period of five years instead of three years as suggested by the University of Punjab

Orissa The State Government have finally accepted the new system of Secondary Education and preliminary arrangements like the construction of buildings etc. have been made for the conversion of the first batch of schools into higher secondary type The first examination under the new syllabus prepared by the Board of Secondary Education Orissa will be held in 1961

Bombay No final decision has been taken so far

Uttar Pradesh No final decision has been taken so far

Dr Shrimali added that the Central assistance was being given to State Governments for their approved programmes for this purpose with effect from 1956-57 The rate of assistance was 60% during 1956 57 and 50% during 1957 58

SPECIAL GRANTS BY U G C.

The University Grants Commission at its last meeting held at Jaipur accepted a proposal to give grants not exceeding Rs 1 lakh each to the colleges which have completed 100 years or more of their fruitful existence This grant in aid is intended for specific needs of each college and will be paid as a token of appreciation of the work done by these colleges during the last 100 years for the cause of higher education in India.

The following seven colleges in various parts of the country will benefit from these grants —

1. Agra College Agra.
2. St John s College Agra
3. Bareilly College Bareilly

4 Wilson College Bombay
5 Krishnnath College Berhampore
6 Scottish Church College Calcutta
7 Serampore Colleg Serampore Calcutta

The Commission also sanctioned a special grant of Rs 5 00,000/ to the S N D T Women s University Bombay as a symbolic token of its appreciation of the contribution made by Dr Karve the founder of the Uni versity to the cause of women s education and desired that this amount be utilised for the development plans of the University

* * *

RAISING STATUS OF TEACHERS

Dr K L Shrimali, Minister of Education n a statement laid on the table of the Lok Sabha on April 2 said that the Government of India had from time to time made certain sugg stions to the State Governments in con nection with the raising of status of teachers

Some of the suggestions the Minister said were

(1) The salaries of teachers should be raised as far as possible and for this purpose the Central Government offers financial assistance to the S ate Governments on a matching basis

(2) Teachers and their organisations should be associated in an increasing manner with the formulat on of educational policies at all levels and implementing educational pro grammes Due encouragement should be given to professional bodies and Associations of Teachers and Headmasters

(3) On the basis of merit and seniority teachers may be considered for appointment on important educational bod es as well as the welfare organisations engaged in constructive work

(4) Whenever a State contemplates any important piece of legislation it may consider the advisability of appointing an Advisory Committee of suitable University teachers to examine it from an academic standpoint

(5) The State Governments may organise special receptions for primary and secondary school teachers by the Head of the State and the Chief Minister

(6) Refresher courses and holiday camps should be organised for teachers

(7) Educational Officers should be direct ed to humanize adm nistration and maintain and enhance the social status and prestige of teachers by their treatment

(8) Due publicity should be given to outstanding work done by teachers in States

FILM WORLD

Annual Oscar Awards

Alec Guiness Britain's "man of 1,000 faces," and Joanne Woodward won the movie industry's top Oscar awards

"The Bridge on the River Kwai" was voted the best picture at Hollywood's 30th Academy awards a show (held in Hollywood on March 27) that many critics called one of the best ever

Red Buttons a comic unwanted by television won the Oscar for the best supporting actor for his first movie and first serious roles He played the U S airman who married a Japanese girl in "Sayonara"

And Miyoshi Umeki who played Buttons wife in the picture won the Oscar for the best supporting actress She was the first Japanese to win the honour

Mrs Woodward had an actress's tour de force in "The Three Faces of Eve" and she did it the hard way The picture was a true life psychiatric study of a Georgian woman with a triple personality Miss Woodward a Georgian herself did the sudden changes in continuity rather than shooting each personality separately

Alec Guiness's award was accepted by British actress Jean Simmons an old friend

Other top awards went to David Lean the British Director of "The Bridge on the River Kwai" and to song writers Sammy Cahn and Jimmy Van Huesen for their hit "All the Way"

* * *

The Oscar

Founded in 1927 by a small group of artistes writers and film technicians the Academy initiated the conferring of Oscar awards as an incentive in raising the standard of motion picture production educationally culturally and scientifically

The Oscar is in the form of a small golden statuette of a man somewhat resembling a mediaeval knight holding a sword vertically in front of him with its point touching the ground For three years the golden figure remained nameless Then in 1931, Mrs Margaret Herrick reported for her first day's work and was formally introduced to the statuette He reminds me of my Uncle Oscar she said thoughtfully and a newspaper columnist who heard the words wrote in his column Employees have affectionately dubbed their famous statuette 'Oscar' and Oscar it remains today

* * *

State Awards For Films

The Hindi feature film *Do Ankhen Barah Haath* has been adjudged the best film of the year It was awarded the President's Gold Medal and a cash prize of Rs 25 000 The Bengali film *Andhare Alo* is second and wins certificate of merit and a cash prize of Rs 12 500 A certificate of merit went to the Hindi film *Mother India*

* * *

Pictures Produced in 1957

Statistically production of Hindi features registered a fall from 123 in 1955 to 116 in 1957 out of which 110 were produced in Bombay and six in South India This represented about 40 per cent of the all India production of 293 features in 1957 as compared to 296 in 1956

The length of these films varied between 10 554 feet and 16 687 feet Four pictures were produced in colour while a number of others had dance sequences in colour Four films were granted 'A' certificates

Production during the year was marked by a swing towards social themes in a larger measure presentation of spectacle and thrills to woo the box office and a record rise in star prices

* * *

Rising Popularity of Cinema

The cinema and radio are continuously becoming more and more popular sources of entertainment with the public of Delhi This conclusion is arrived at by the Bureau of Economic and Statistics Delhi after analysing the data for the first and second quarter of the last year

The general index of cine-goers in Delhi indicates that cinemas are gaining more and more popularity with the people The general index which stood at 235 in May 1956 rose by 23 points and stood at 258 in May last

The index however showed a sudden steep decline from 258 in May last to 99 in June last due to the break of influenza epidemic necessitating in the closure of cinema houses in the Capital

* * *

Film Finance Body

In reply to a supplementary question in the Lok Sabha Dr B V Keskar, Union Minister for Information and Broadcasting disclosed that the preliminaries of the Film Institute the Film Production Bureau and the Film Finance Corporation had already been worked out He, however added that the delay in the setting up of these bodies was entirely due to the present difficult financial position All these three units had been accepted in principle He expressed the hope that the Government would be able to set them up as quickly as possible

Dr Keskar added that as far as the Film Finance Corporation was concerned the [illegible] long discussion between the Finance Ministry and the Ministry of Information and Broadcasting The plan for the other two units was also ready It would now depend on financial availability when the Government could begin all the three units

Answering another supplementary Dr Keskar said that the Government had advanced a loan to only one film producer

Dr Keskar also said in reply to another question that the Government did not propose to change the constitution of the Central Board of Film Censors

* * *

Film Festival in Italy

Japan the United States and Canada were among the winners of six gold medals at the fourteenth International Sports Motion Picture Festival which was held in Ampezzo (Italy)

The Italian Olympic Committee awarded the medals to what were regarded as the best of 65 sporting films shown there by a total of fifteen nations

Among the winners of other cups donated by public and private organisations was India with Operation Keddah

* * *

Censor Certificate

The validity of Censor certificates has been raised from five to ten years with effect from March 1 1958 it was officially stated

This concession will be applicable to all certificates in force on that date

It has however been provided that the Central Government may of its own accord or on the advice of the Central Board of Film Censors reduce the certificate of ten years to any period but not less than five years from the date of issue as it deems fit These changes have been embodied in the Cinematograph (Censorship) Rules 1951

The extension of the life of certificates of public exhibition for films has been done on the request of the film industry

* * *

The Metropolitan Exhibitors Union of Tokyo is studying means to prevent unrestricted construction of cinema houses in the city and has decided to set up a committee to examine would be-builders before their applications are accepted by the construction office

The number of cinema houses in the city as at the end of 1957 was 633, compared with 326 in 1953

* * *

Walk of Fame"

The names of 1,500 top film stars of all time have been selected to be engraved in bronze and cemented into a new Walk of Fame in Hollywood One top name is missing Charlie Chaplin s

The chairman of the name choosing committee said that ' opinion on him was divided He added We are not trying to rewrite the history of the entertainment industry

"Hitler s name can t be erased from the pages of history but I doubt if anyone is interested in aggrandising him further"

* * *

Film Feelies

Attempts are being made to make films containing "shots which will not be visible to the audience Such pictures may be known as film feelies

According to the new process called the subliminal process a message is flashed on a screen so quickly that it leaves no visual impression It does however register on the subconscious mind Advertisers are interested in the technique, which it is claimed makes people want to buy a product without realising why

Producer Hal Roach Jr who plans to make a film in the new process believes that the subliminal method can be employed to strengthen the dramatic content and emotional appeal of his story by presenting on the screen symbols or other information projected at such a speed that it would not be visible Roach s film in which this will be tried is a science fiction story dealing with extrasensory perception

The system has tremendous potential In fact adding a new dimension to movies namely the dimension of feel , it is explained

* * *

Position of British Film Industry

Britain s cinema owners campaigning for the abolition of entertainment tax on tickets say in their annual report the position is now desperate "

Immediate relief would enable them to move forward on a sound economic basis

During 1956 and last year says the Cinematograph Exhibitors Association 417 cinemas were closed down in that country because of their financial position

If " says the report, by tax relief exhibitors are able to meet the rises in operating costs which have occurred since 1939 there is no reason to believe that good films will not continue to draw the public from their homes in sufficient numbers to make film exhibition a satisfactory rewarding business

The reference to drawing people from their homes is an indication of the anxiety felt at the menace of television rivalry Licences issued numbered 7 752 000 last year against 46 000 in 1948

* * *

FAMILY PLANNING PROGRAMME

For execution of the various facets of the Family Planning Programme the sum allocated for the Second Plan is Rs 497 lakhs Rs 400 lakhs of it is intended for schemes by the Centre and Rs 97 lakhs for schemes in State Governments plans

The objectives aim to educate the people on the need for limiting families and the significance for such limitation in the larger context of national economic and social progress

A fundamental consideration in this connection is that population in India is growing at the rate of 5 million persons on an average every year and the various programmes for economic development envisaged in the Five-Year Plans would be in danger of being upset by a continuous increase in the population at this rate

A large scale opening of family planning clinics and centres at which instruction in family planning would be combined with popularisation of the methods by which the objectives can be attained is the first item in the programme

Next to it priority is to be given to the training of persons like doctors health visitors social workers and field workers

During the Second Plan period 2 000 rural and 500 urban clinics are proposed to be established throughout the country in addition to 147 set up in the First Plan period

For the training of personnel provision has been made at three institutions namely, the Family and Research Centre in Bombay the Family Planning Demonstration and Experimental Centre at Ramanagram and the All India Institute of Hygiene and Public Health, Calcutta

To carry out further studies in population trends and research work on better and effective contraceptives two Demographic Centres have been started—one at Bombay in collaboration with the Dorabji Tata Trust which will also function as a regional centre of the United Nations and the other in Delhi under the auspices of the Delhi University

LETTERS to the EDITOR

Letters from the readers giving their own opinion or point of view on all interesting subjects are published in these columns. Letters should be brief to the point neatly typed double space. They may be written under a pseudonym but must be accompanied by writer's name and address. The views expressed here do not necessarily reflect editorial opinion or policy.

OUR NATIONAL LANGUAGE

Sir,

I crave the hospitality of your columns to publish a few lines in your esteemed journal. I feel pained at the views expressed in your editorial column. In going to plead for Hindi as National language facts have been clearly denied. Our Parliament composed of so many eminent educationists and politicians endorsed the view that Hindi should substitute English as our National Language. But one point should be borne in mind that brute majority is inseparably bound up with the Democracy. Many scholars and politicians whose competence in their respective fields is beyond doubt have deplored the idea of Government imposing Hindi against the will of the people. The fear that the North will be in an advantageous position over the other parts of the country is not entirely baseless. The idea that those who oppose the imposition of Hindi are unpatriotic is fantastic as Chakravarty Rajagopalachari rightly pointed out that it is Bengal who is the pioneer of the struggle of independence.

Lovers of Hindi like to say goodbye to English only because it is a foreign language which is itself doubtful and no other arguments are available againt English. English is an International Language and the most developed language in the world. We must have English so that we may keep ourselves in line with the outside world and our progress may remain unhampered. To drive out such a rich language out of silly sentiment is deplorable and detrimental to the healthy growth of culture. Lovers of Hindi as evident from your article are very sensitive towards English being the foreign language but you propose to standardise and develop Hindi by borrowing words from English. In this case you did not feel repulsive against English which is according to you a foreign language. Such attitude is paradoxical. Only one third of the population of the country have their mother tongue in Hindi which they have decided to impose on the remaining two-third population of the country. Interest of the majority of the masses must be guarded in a country particularly with its Socialistic Pattern of Society. In all India Competitive Examinations the Hindi Speaking people on the imposition of Hindi will be in an advantageous position compared to those whose mother tongue is not Hindi. This will naturally stir the mental balance of those whose mother tongue is not Hindi and a sense of aggrandisement mixed with hatred will make the problem more acute. In view of these facts my suggestion is to let English continue as the official language of the Union and as an interstate language. Every effort should be made, in the mean time to develop Hindi and every one should try to learn Hindi but only on voluntary basis.

Shillong, 14.3.1958

Yours etc.,
S. N. Choudhury

* * * *

LINGUA FRANCA OF INDIA

Sir,

Hindi had already been adopted as the National Language of India in 1950 and 15 years time was allotted for its development but no drastic steps have yet been taken to achieve the proposed ends. The well wishers of Hindi on one hand have adopted a wrong concept to thrust it on the non Hindi speaking people and on the other hand the non Hindi speaking people are trying to ignore the fact that Hindi is the National Language and should be learnt as soon as possible. The simple and common

words from other languages should be adopted for enrichment of Hindi. At the same time the non Hindi speaking people should try to learn it and not be afraid of it. While Hindi is spoken by 42 per cent of total population of India, English is spoken by a decimal percentage. Hindi is the only language to become the *lingua franca* of India.

Simla — Yours etc

FOOD SITUATION IN INDIA

Sir,

Food has consistently proved to be the Achilles heel of Indian economy. This tragedy is accentuated by the fact that ours is essentially an agricultural country with a sizable proportion of the teeming millions drawing sustenance from the soil. With self sufficiency in foodgrains ever receding like the elusive horizon there is no knowing when the country would be able to do without imports from abroad to fill the bellies at home. There has been forsooth glib talk from time to time with regard to increase in production but the stark reality is there that nothing has countervailed against the natural calamities symbolised by the relentless floods and droughts through all these lean and trying years. All this constitutes a forbidding picture and it cannot be said with any degree of precision that the situation in this wise is going to improve in the measurable future.

Today there is an avalanche of loose talk about industrialisation of the country at a galloping speed. But the dictates of reason and robust realism suggest strongly that the superstructure of this imposing edifice of industrialization will continue to be based on a sandy foundation so long as there is not a sound agrarian economy to sustain it at the bottom. If we are inured to importing foodgrains for domestic consumption making a draft on our precious little foreign exchange in the process the country is never never going to make much headway no matter how pious the resolution may be to reconstruct the nation. It is on the authority of a person no less than the vigilant Prime Minister that the clamant and exigent need of the hour is more and more production. It simply comports with a country like India where agriculture provides the mainstay for the subsistence of 70% of the population that there should be at least enough food in the country to go round. Our proposed development will be grievously lop-sided if agriculture which accounts for nearly 40% of the total national income is indiscreetly relegated to the back water. Any form of inefficiency or insouciance in the matter of improving and toning up our agrarian economy should not at any rate be countenanced at this crucial hour of our national existence. The machinery of the State should not move sluggishly in rising to the occasion and making up the leeway through a bold bid to augment the indigenous resources. For the successive onslaughts make the conclusion irresistible and ineluctable that there should be no unconscionable delay in devising ways and means to proffer seasonable incentives to make our cherished dream of increased production come true. Experience, a hard task master teaches us in the painful way that we can ill afford to leave our agricultural operations to the tender mercies of rains and floods or for that matter take half-hearted measures to forestall the ruin that these natural agencies bring in their wake.

Yours etc
Arrah (Bihar) — Prem Chandra Sinha

INDIAN INSTITUTE OF TECHNOLOGY

Dear Sir,

With reference to the Question Box column of Careers and Courses March 58 I regret to point out the glaring omission of Indian Institute of Technology Kharagpur from the list of technical centres providing training in Tele Communication Engineering.

Indian Institute of Technology was established in *1951 and at present it has got 500* students in nine different engineering subjects. It provides facilities for post graduate and post doctorate studies in almost all engineering and particularly in Tele Communication and Electronics. In this department at present eight students are doing post graduate studies, four in U.H.F. and Microwave Engineering and four in Radio Broadcasting Engineering.

Indian Institute of Technology Kharagpur is now an autonomous body and enjoys the status of the Institute of National Importance from last year. Before being declared so it was directly under the Ministry of Education, Govt. of India.

Kharagpur — Yours etc
3-4-58 — W. S. Sodhi

• • •

In these columns we answer the queries from our readers. It may not be possible to answer each and every question but a considered reply shall be given to selected questions. Letters from our readers are welcome. These should be addressed to the **Editor, Question Box.**

SWITZERLAND AND THE U. N. O.

Q. 1. Switzerland being an independent nation for a long time is not a member of United Nations. Why? —*Narendra Ahuja, New Delhi*

Ans. Switzerland is a natural country whose neutrality is internationally recognised so it is not a member of any international political organization.

ATOMIC REACTOR

Q. 2. What is the function of the Atomic Reactor and its basic principle of action? —*Ranadhir Das, Balasore*

Ans. Atomic reactor is a structure consisting of fissile material e.g. uranium together with suitable moderator e.g. carbon or heavy water so arranged in a lattice that energy is continuously released in a controlled manner as the result of nuclear fission. A suitably designed pile can also be used for the production of plutonium, an element of great importance in connection with the atomic bomb. In the atomic pile the uranium atom is excited by capturing a neutron and undergoes fission. Apart from the elements of approximately equal mass formed as a result of this disintegration an average of two or more neutrons are also emitted. These neutrons produce further fissions in the uranium atoms and a chain reaction develops. This is controlled by inserting neutron absorbers into the pile, which absorb all neutrons in excess of the number required to maintain the reaction at a constant level. The moderator rapidly slows down the fast neutrons emitted by the fission process increasing their chance of capture to produce further fissions.

THE CENTRE AND THE STATE GOVERNMENTS

Q. 3. How does the Communist Government of Kerala abide by the decision of the Central Government of India which is Congress? They are quite two different political governments. —*Suchendra Nath Deka, Dandua*

Ans. The relation between the States and the Union are governed by the Constitution of India and any dispute arising between a State and the Union is referred to the Supreme Court. So it does not matter if the party in power in a State is different from the party in power in the Centre.

CHAIN REACTION

Q. 4. What is chain reaction in case of atomic fission? —*D. K. Kshemkalyani, B.E. (Civil), Ajmer*

Ans. A rapid Chain Reaction can be developed within the atomic pile. In this reaction a neutron splits a nucleus which instantly ejects at least two new high speed neutrons which in their turn split other nuclei. More neutrons are ejected to shatter other nuclei and so on indefinitely. Thus millions of nuclei yield their vast stores of energy instantaneously.

DELHI CORPORATION

Q. 5. What changes are likely to be there in the administration of Delhi with the enforcement of Corporation Act? —*Dina Nath Sharma, New Delhi*

Ans. As compared to the Delhi Municipality the Corporation will have wider powers and its jurisdiction will extend over larger area. The local bodies brought under the Corporation will function as zonal offices directly under the Central office of the Corporation at the Town Hall. The work of the Corporation will be conducted by different committees. Members to the Standing Committee, Electric Supply Committee, Transport Committee and Water Supply and Sewage Committee will be elected. The Standing Committee will have 14 elected members while

the Electric Supply Committee the Transport Committee and the Water Supply and Sewage Committee seven members each four elected and three nominated

DEFINITION OF PSYCHOLOGY

Q 6 Please let us know whether psychology is a study of the Human mind or of the 'Human Heart —*J M Sinha Dehra Dun*

Ans Psychology is defined as a science which classifies and analyses the phenomena or varying states of the human mind Recent developments in psychology have broadened the scope of this science and it studies the behaviours of the heart (in the sense of feelings) as well as the mental states

NATIONALITY—AN EVIL

Q 7 Nationality is the greatest evil for the nation and it is proper for a nation to avoid this evil

—*Jai Bahadur Singh, Askote*

Ans. The idea of a nation in the modern sense is of recent origin but the craving of the individual to belong to a certain group of his own kind is very ancient There is nothing wrong in this idea and 'generally speaking' it is conducive to good of humanity but it becomes an evil only if it implies hatred for other nations Shri Jawahar Lal's advocacy of co existence will greatly help in freeing the idea from any evil effects The need of the day is not to avoid nationality but to cleanse it of the evil that it sometimes breeds

ENERGY WORK AND POWER

Q 8 What is the difference between work, energy and power ?

—*Nirmal Kr Chakravarty Sahibganj*

Ans Energy is the capacity to do work. Work is the advantage gained through the transformation of one kind of energy into another kind and power is the measure of the capacity of a body or a machine to do work

INDEX NUMBER

Q 9 What is an Index Number ?

—*M A Karim Darbhanga*

Ans Figures of price levels arranged in a table with a view to showing the changes in the prices of goods and services

STOCK EXCHANGE

Q 10 What is Stock Exchange ?

—*Lilaraj Mitra Balrampur*

Ans A place where the operations of buying and selling stocks and shares are carried on

CIVIL AVIATION IN FIRST HALF OF 1957

The Air India International and the Indian Airlines Corporation between them carried 309 048 passengers and flew 11,587 929 miles during the half year ending on June 30 1957

Air India International alone flew on its scheduled services 3 081 556 miles carrying 41 582 passengers 1 773 024 lbs of cargo and 732 836 lbs of mail during the first half of 1957, as against 2 933 400 miles flown 39 974 passengers and 1 593,575 lbs of cargo and 672 110 lbs of mail carried during the preceding six months

During the period under review Indian Airlines Corporation flew 8 506 373 miles carrying 267 466 passengers 40 612 080 lbs of cargo and 5 748 104 lbs of mail. The respective figures for the preceding six months were 8 929 211 miles 242 602 passengers 47 077 105 lbs of cargo and 5 921 985 lbs of mail

During this period the Night Airmail Services carried 31 967 passengers 1,406 529 lbs of cargo and 2 113 967 lbs of mail

In addition to the two Corporations and the twelve Flying Clubs six other transport companies held current permits for the operation of non scheduled services on June 30 1957

On non scheduled services operated by Indian air carriers 3 146 550 miles were flown and 74 728 passengers and 56 826 093 lbs of cargo were carried during the half year ending June 30, 1957

The total number of aerodromes maintained by the Civil Aviation Department at the end of June, 1957 was 84

The number of aircraft holding current Certificates of Registration at the end of June 1957 was 533 of which 199 held current Certificates of Airworthiness

The number of persons holding current Pilot's A licences increased from 523 at the end of December 1956 to 715 at the end of June 1957 There was however no change in the number of B pilots holding current licences which stood at 586

The number of Aircraft Maintenance Engineers holding Indian licences increased from 870 in December 1956 to 903 in June 1957

SCIENCE & INVENTION

EXPERIMENT WITH DOG 'LAIKA' SUCCESSFUL

The dog Laika the first animal to travel into space aboard the Second Soviet Sputnik stood satisfactorily not only the launching and the orbiting of the Sputnik but also the orbital flight itself

This statement was made in Moscow on March 25 by Academician Aleksandr Topchiev, Chief Scientific Secretary of the Presidium of the USSR Academy of Sciences at the annual meeting of the Academy His report is devoted to the results of scientific research and its practical application in 1957

He said that the checking of the possibility of survival of an organism in cosmic flight was a unique experiment which was successful

Preliminary results of the study of 'Laika's' behaviour show that the acceleration of the Sputnik's flight at its launching and orbiting—which is the most difficult stage from the biological standpoint—had acted on the animal in the direction from its chest to its back He recalled that the movement of the Sputnik was accelerated and that the rate of acceleration was several times higher than the acceleration of gravity It has been established that simultaneously with the effect of the acceleratinn the animal was also affected by the vibration and for a certain period by the sound of the rocket engine

An analysis of the data has sh wn that immediately after the start the heart action quickened roughly three fold as compared with its initial state Later on as the effect of the acceleration persisted and even increased the frequency of the heart action fell The electrocardiogram did not reveal any still effects. It showed a typical picture of thick ned heartbeats the so-called Sinus Tachyca dia

As the apparent weight of the animal increased its respiration became more superficial and accelerated At the height of the effect of the acceleration the number of respirations was three to four times higher n th iy

Academician Topchiev declared that the animal had satisfactorily stood the flight of the Sputnik from start to orbiting During the subsequent flight in orbit the animal was in a state of dynamic imponderability The number of respirations declined the frequency of the systole continued to fall systematically and to approach the initial magnitude In spite of imponderability the motorial activity of th animal was moderate

The experiment with "Laika" has demonstrated that imponderability did not in itself cause any substantial enduring or changes in the animal's physiological funct ons

* * * *

DEVICE DOES WORK OF 3 000 CLERKS

A new electronic typewriting device has been perfected in the United States which can record enough data in 30 seconds to fill a 300 page book. It is made by the General Dynamics Corporation

Called the Computer Readout the device is designed to record information provided by giant computers or elcetronic brains It can record in permanent readable form the data output of computers at speeds 10 times as great as those of any other recording method

The General Dynamics Corporation says that the device is able to do as much work as 3 000 human stenographers It can record more than 259 000 000 words a day or their equivalent in figures or diagrams

* * *

ATOMIC CLOCK

Two U S scientists have told the Institute of Radio Engineers their of development of a compact atomic clock no bigger than a typewriter which would be accurate to within one second in every 100 years They said that with more work the clock could be made accurate to within one second every 3 000 years The clock operates on the principle of a radio frequency beat from gaseous sodium or cesium The regularity of this resonance keeps the time like the swing of a mechanical clock's pendulum The scientists are Maurice Arditi of the International Telephone and Telegraph Company and T R.

WHEELLESS VEHICLE THAT RIDES ON AIR

The Ford Motor Company of Detroit has demonstrated a three-foot model of a wheelless vehicle that rides on a thin film of air a fraction of an inch above the roadbed Tiny jets of air that can be produced either by a gas turbine or turbojet engine hold the vehicle up Ford engineers say the vehicles will be able to travel for long distance at sustained speeds over 200 miles an hour —an impossible fact today with conventional land vehicles Ford engineers estimated that only about 90 horse power would be required to levitate a one ton vehicle and propel it at 100 miles an hour

• • •

COLD WELDING OF METALS

Academician Konstantin Khrenov and Grigori Sakhatsky M Sc (Engineering) have elaborated a method for the cold welding of metals at the Electric Engineering Institute of the Ukrainian Academy of Sciences in Kiev It is based on the utilization of the following qualities of certain metals under high pressure

For instance a firm connection of wires is achieved with a simple instrument with special hand plyers weighing less than 1 5 kg The ends of the wire when pressed by the plyers are subjected to pressure of several thousand atmospheres This effort is sufficient for the firm piecing of the wire ends No traces are left at the joint as for instance, can be found after soldering or electric welding of metals Tests have proved that the joints made by cold welding are by far superior in durability to the other parts of the wire

This method is used at the Kiev Ukrkabel Plant for welding aluminium wire At the Zaporozhye Transformer Plant this method is used for welding bars 6 mm thick and 60 mm wide for the electric distribution devices

• • •

"RUBY EYE" SEES TEN TIMES CLOSER

The Navy's radio telescope in Washington has been equipped with a ruby eye for a ten times closer glimpse of venus one of the earth's nearest planetary neighbours.

Developed jointly by the Naval Research Laboratory and Columbia University the device will permit greater amplification of microwaves coming from outer space radio-

Prof. Charles H Townes, Columbia physicist, said the amplification device with a synthetic ruby as its core represents "the first step toward eventual increase to about 100 times the sensitivity of today's electronic telescopes"

The amplifier is known as a maser The term means "microwave amplification by stimulated omission of radiation"

The first maser unit produced in 1954 used gas as its operating medium The latest unit has instead of gas a synthetic ruby Scientists are already at work on still another medium — a crystal of potassium cobalticy anide

Radio-astronomers said electronic telescopes do not give an optical image of a heavenly body By examining radio waves from venus and using data reduction machines, scientists are expected to acquire much new information about outer space

One of the first tasks of the navy's "ruby-eye" equipped 50-feet (65 meters) telescope will be to learn more of the temperature of venus, second planet from sun which is slightly smaller than the earth Venus comes within 26 million miles of the earth at its nearest point

"The radio telescope is making it possible to find out such things as the temperature of venus surface, and may give us information on the length of its day and the nature of its terrain Townes said "Thus we will know more about conditions that exist on venus for possible life on the planet

• • •

TRIP TO MOON

Man should be able to land on the moon and the planet Mars within 10 to 15 years Mr James E Edson Assistant to the Director of Research and Development of the U.S Army said in Chicago on March 20

He wrote in a scientific bulletin that such landings would be possible at the normal rate of engineering progress

And the moon pioneers may not need oxygen he stated Space medicine people are working towards the development of a synthetic nutrient which could be injected into the bloodstream making breathing eating and drinking unnecessary

He thought that within the next two or three years trained men could confidently go on space trips lasting several days.

The United States announced plans to send space ships to the moon and perhaps even land on it

The space ships will carry a "primitive television" device to scan the satellite including the side which cannot be seen from earth.

The American plans approved by President Eisenhower, in Washington on March 27, call for at least five attempts to send unmanned space vehicles to the lunar area Two of these attempts will be made by the Army three by the Air Force

A Defence Department spokesman said it was not the present intention to hit the moon but it was possible that one of the five vehicles could do so

An initial allocation of about eight million dollars (about £2 857 000) had been made to the three services the Department said

The Los Angeles ' Examiner reported on March 28 that the jet propulsion laboratory of the California Institute of Technology will try to send an artificial satellite to the moon possibly as early as next August

The laboratory which developed the U S Army s Explorer satellites is capable of putting a satellite 'in the vicinity of the moon with present equipment the newspaper report said

The California laboratory s plan would equip the satellite with a two or three pound booster propellant charge which ignited at the peak of the orbit would be timed to send the satellite out of orbit and towards the moon There was a remote possibility the satellite would hit the moon the report said

GIANTS FROM DWARFS

A Harvard University medical school professor claimed in Boston on March 29 that he could make dwarfs grow and produce giants at will within a few years thanks to hormone injections taken from the brain s pituitary gland

Speaking to American and foreign newsmen who were visiting American cancer research centre Dr Philip Heneman said biologists can now control human and animal growth thanks to intravenous injections taken from the finger sized pituitary gland

The pituitary gland holds the key to all the body s hormonal system growth sexual activity heart beats etc

Dr Heneman said he had treated seven child dwarfs ranging in age from three to thirteen whose pituitary gland either did not work or had been removed

Results obtained on three of the children were remarkable he said In 45 days they grew two centimeters while their normal yearly growth had varied between one and two centimeters

When adults were injected with the hormone no exterior growth was noticed although their bones became thicker and stronger

Heneman also noted that all during the treatments the patients lost rather than gained weight The body used the fat to furnish the energy needed for the growth he added

Heneman concluded that this pituitary gland hormone was a decisive factor in obesity The hormone may also hold the secret to youth and the key to senility may be tied to a hormone deficiency he said

These experiments may have great importance in the fight against cancer which in basic terms is a rapid growth of abnormal glands in the body The removal of the pituitary gland from women suffering from breast cancer has done away with all trace of cancer in their bodies Heneman noted

STRONTIUM 90 IN HUMANS

The concentration of radioactive cancer-producing strontium 90 in human beings rose 33% last year but is still only a hundred and fiftieth of the maximum permissible total

This was reported in New York on February 6 by three scientists of Columbia University—Dr Laurence Kulp Associate Professor of Geochemistry and Dr Arthur Schulert and Dr Walter Eckelmann, research associates at the university

They said that if atomic and hydrogen bomb tests continued indefinitely with the present rate of fallout the levels would rise to one fifth of the maximum permissible concentration about the year 2000

The Columbia University report was based on an analysis of more than 1 000 human bone samples as well as food and soil

Now *in its fifth year* the survey consists of a worldwide study *of the concentration of radioactive fallout in the bone structure of* man

It was found that children up to the age of four have 10 times the concentration found in adults of 20 years and older

The scientists said levels in Russia were most likely higher than in the USA due to the closer proximity of test sites

They said human beings absorbed strontium from vegetables and milk products ***

PEOPLE IN THE NEWS

The Union Cabinet was reshuffled on March 13 1958 In addition to new Ministers some old Ministers were allotted new port folios Here are brief life-sketches of Ministers with new portfolios.

MR MORARJI DESAI

Mr Morarji Desai (Minister of Finance) former Chief Minister of Bombay was born in 1896 and was educated at Wilson College Bombay He is a member of the Congress Working Committee He has been Union Minister of Commerce and Industry and is the unofficial Vice-Chancellor of the Gujerat Vidyapeeth

MR S K PATIL

Mr S K Patil (Minister of Transport and Communications) who was born in 1900 at Jaswantwadi, in the Ratnagiri district of Bombay was educated at St Xavier s College Bombay and London University College He was in the thick of the political movement and was Mayor of Bombay for three consecutive years He was a member of the Bombay Legislative Assembly and later of the Constituent Assembly of the Provisional Parliament and of the first Lok Sabha. Mr Patil was the President of the Bombay City Congress Committee for several years until he joined the Union Cabinet

HAFIZ MOHAMMAD IBRAHIM

Hafiz Mohammad Ibrahim (Minister of Irrigation and Power) 65 who has been a member of the Uttar Pradesh Cabinet since the first time the Congress took office in 1937, is a tried Congressman He is highly respected as a social worker and was recently included in the Congress Working Committee

MR B GOPALA REDDY

Mr B Gopala Reddy (Minister of Economic Affairs) has considerable experience as an administrator having been a member of Rajaji s first Cabinet of Madras in 1937 He was Chief Minister in Andhra and has been Finance Minister of the expanded State of Andhra Pradesh Born in 1907 he graduated from Viswa Bharati, Shantiniketan He was a member of the University Syndicate

MRS TARAKESWARI SINHA

Mrs Tarakeswari Sinha (Deputy Minister of Economic Affairs) is the youngest member of the Council of Ministers being just past 31 As member of the Lok Sabha for a second term she has from the start of her parliamentary career been taking a keen and active part in discussions on economic and financial matters and her presence is invariably felt during question hour

Daughter of the late Dr Shivanandan Prasad Sinha, Mrs Sinha was educated at the Arya Kanya Mahavidyalaya Baroda Calcutta University Bankipore Girls College Patna and Patna Women's College where she obtained her M. A

She was married in 1943 to Mr Nidhi Dev Narayan Sinha and has a daughter From 1945 onwards she has held prominent positions in student labour and cultural organisations On her election to Parliament, she became a member of the Consultative Committees of Finance Commerce and Industry and also of the Public Accounts Committee of the first Lok Sabha

She was a member of the Indian delegation to the last session of the U N Security Council.

MR S V RAMASWAMY

Mr S V Ramaswamy M A Bar at Law F.P C S (London) (Deputy Minister of Railways) has been representing the Salem constituency in Parliament from the first Lok Sabha onwards Born in 1906 he was educated at the Madras Christian College London School of Economics and the Middle Temple He is a senior advocate in the Supreme Court. He has been associated with several welfare organisations and has been a member of the Advisory Committee for Government hospitals since 1950

In 1949 he erected a replica of Sarnath Stupa in memory of those who lost their lives in the freedom struggle

Mr Ramaswamy was a member of the

Indian Parliamentary delegation to Turkey and was parliamentary adviser to the Indian delegation to the eleventh General Assembly session of the United Nations

MR. PURNENDU SEKHAR NASKAR

Mr Purnendu Sekhar Naskar, M A, (Deputy Minister of Rehabilitation) who has been a member of Parliament since his election to the first Lok Sabha, representing the Diamond Harbour constituency of West Bengal, was born in 1921 He graduated from Calcutta University He has been Parliamentary Secretary to the Minister of Works, Housing and Supply since 1956 He was member of the Indian delegation to the ninth and tenth sessions of the General Assembly Mr Naskar belongs to the Scheduled Castes

MR. AHMED MOHIUDDIN

Mr Ahmed Mohiuddin B A (Cantab) (Deputy Minister of Civil Aviation) who has been a member of Parliament for a second term representing Secunderabad Andhra Pradesh was born in 1898 He was educated at Aligarh and Cambridge Universities He was professor of Economics Nizam s College and member secretary of the Hyderabad Banking Inquiry Committee and later of the Hyderabad Co-operative Finance Inquiry Committee

He was Director of Commerce and Industry Hyderabad from 1938 to 1943 and represented Hyderabad on the National Planning Committee appointed by the Congress in 1939

* * *

VIVIAN ERNEST FUCHS

'Bunny Fuchs Age 50 Doctor of Philosophy in geology Father of a grown up daughter and a senior schoolboy son

He is the son of a German who came to England at an early age and prospered as a farmer His schooldays were spent during the First World War when anti German feeling ran so high that some patriots even stopped keeping Dachshunds Possibly it was then that Vivian Fuchs learned the self control and determination which now are his predominent characteristics

By training and profession Vivian Fuchs is a geologist But his training was done at St John s College Cambridge, famous as a breeding ground for explorers He was only 21 when he went to East Greenland with a university exploration party

Yet the man who was to become famous as an Antractic explorer found the outlet for his questing urge in the tropics Three times he joined expeditions to East Africa During these he worked on his Ph D thesis on the tectonic geology of the Rift Valley the great natural depression which swings up through East Africa. On another occasion he nursed an ancient motor car across the Sahara Desert

In 1935 he was awarded his doctorate But two years before then he had married Joyce Connell, an enterprising and adventurous young woman who had already journeyed alone around the world and with family responsibilities looming Fuchs saw that he would have to settle down to a bread and butter job As a geologist the choosing of a job was uncomplicated It would have to be with one of the big oil companies

Fuchs however managed to squeeze in one last expedition to East Africa and before he could become enmeshed in bread winning routine war broke out

The Army sent him not to East Africa which he knew but to West Africa a wartime backwater Even there his qualities as a leader and organizer attracted attention and he was posted to the Staff College at Camberley From then on he was in the thick of the war serving throughout the European campaign until V day For this work he was mentioned in dispatches

During the war the Argentinians laid claim to the whole Graham Land sector of the Antarctic Britain had a longstanding claim to this area and it was decided that this should b demonstrated by setting up basis there The job was given to the Falkland Islands Dependencies Survey Not much public attention was paid to this or to the recently demobilized Major V E Fuchs who was made chief of the Survey At one point Fuchs was marooned in Graham Land for a year when his relief was turned back by impenetrable ice

That enforced isolation was to pay dividends in terms of British prestige For Fuchs used his time to plan in detail a dream he had been nursing—to follow through Sir Ernest Shackelton s plan for a trans Antarctic crossing No doubt Dr Bunny Fuchs the quiet geologist from Cambridge can stand proudly in the line of men of high adventure

Foreign Events

UNITED ARAB STATES

A plebiscite held in Egypt and Syria on February 21 resulted in an overwhelming majority for the union of the two countries and in the election of Colonel Nasser as first President of the United Arab Republic (U A. R.) President Nasser formed the first U A R. cabinet on March 6 An agreement was subsequently signed on March 8 whereby a federal union was established between the U A R and the Yemen under the name of the United Arab States

The plebiscite of February 21 resulted in a 99.99 per cent majority in favour of union in Egypt and a 99 8 per cent majority in Syria For Colonel Nasser's election as President the voting figures were 6 102,116 in Egypt and 1 312 809 in Syria against 265 in Egypt and 186 in Syria

After the result was announced President Kuwatly and the Syrian Canbinet headed by M Sabry Assali tendered their resignation to President Nasser Foreign diplomatic missions to Syria automatically lost their official status with the confirmation of the union but were allowed two months in which to wind up their work during which period their immunity and privileges continued

Between February 22 and 25 the United Arab Republic was officially recognized by Afghanistan Albania Belgium Bulgaria Ceylon Communist China Czechoslovakia Denmark Western Germany Greece Hungary Indonesia Italy Japan Netherlands Norway Spain Sweden Switzerland Tunisia the U S A the U S S R. and the Vatican Lebanon and Saudi Arabia announced their recognition on February 26 the Sudan on March 3 and Pakistan on March 11 By March 13 recognition had also been accorded by Ethiopia India Yugoslavia and all other countries having diplomatic representation in Cairo except Iraq Jordan Panama and the Philippines (Great Britain France and Australia have at present no diplomatic relations with Egypt) The Iraqi Foreign Minister (Dr Jamali) stated on March 6 that Iraq would not recognize the U A R. at present and denounced it as an "unnatural union" and "a forgery and a farce

The U N Secretary General Dr Hammarskjold, announced on March 7 that he had accepted the credentials of the delegation of the U A R. which had become a single member of the U N in place of Egypt and Syria—thereby reducing the number of U N member countries from 82 to 81 The delegation of the United Arab Republic at United Nations headquarters will be headed by M Omar Loutfi formerly head of the Egyptian delegation at the United Nations

On February 24 President Nasser flew to Damascus for consultations with Syrian political leaders on the Constitution of the U A R and on formation of his Cabinet. A provisional Constitution which expanded to 75 Articles the 17 point programme announced on February 5 was proclaimed on March 5 the most important new provisions were that the President could appoint and dismiss one or more Vice Presidents and that the National Assembly would have the right to pass a vote of no- confidence in a Minister of the Republic.

The appointment of President Nasser and four Vice-Presidents of the United Arab Republic and the membership of the first Cabinet of the U A R. were announced in Damascus on March 6

Union with Yemen An agreement establishing a federal union between the United Arab Republic and the Yemen under the name of the United Arab States was signed in Damascus on March 8 by President Nasser and the Crown Prince of the Yemen Mohammed el-Badr The terms of the agreement which had been drafted during negotiations in Cairo on February 6—16 and subsequently approved by the Imam of the Yemen were as follows

(1) The United Arab States would be a federation of the U A R the Kingdom of the Yemen and those Arab States which will agree to join this Union

(2) Each State would preserve its

international personality and its system of government

(3) Defence and foreign policy would be unified and economic policies co-ordinated A Customs union and a common currency would be established later

(4) The heads of member States would constitute the Supreme Council of the Union

(5) A permanent Federal Council consisting of six representatives from each member State appointed for three years would assist the Supreme Council in the exercise of its duties handle the political affairs of the Union and prepare plans and measures designed to achieve closer unity The members of the Supreme Council would preside in turn over the Federal Council for a year at a time and their decisions would have to be unanimous

(6) Councils for defence economic questions and cultural matters would be attached to the Federal Council

(7) The United Arab States would have a separate Federal budget to which the U A R would contribute 97 per cent and the Yemen 3 per cent

(8) A federal authority would define the frontiers of the United Arab States

Orders issued by the Supreme Council on March 13 appointed Field Marshal Hakim Amer as C in C of the armed forces of United Arab States named the Yemeni port of Hodeida as the permanent seat of the Federal Council which however would also meet periodically in Cairo and Damascus and set up a central currency organization for the Yemen with authority to issue currency and control financial operatians A new paper currency would be issued—to be known as the Yemen pound with the same value as the Egyptian pound—and silver rials of the same value as the existing Maria The esa thalers would be the smaller monetary units

The Total population of the United Arab States is about 35 000 000 — 23 000 000 Egyptians 4 000 000 Syrians and 8 000 000 Yemenis

S-EATO COUNCIL OF MINISTERS MEETING

The Council of Ministers of the South East Asia Treaty Organization consisting of Australia France New Zealand Pakistan, the Philippines, Thailand, the United Kingdom and the United States met in Manila from March 11 to 13

Inaugurating the session the Philippines President Mr Carlos P Garcia said "I would commend to this Council an increased emphasis in research or appropriate ways of lending greater substance and reality to the provisions of the Treaty pertaining to economic, social and cultural progress He also emphasized need of having appropriate forms of contact between S EATO and other free world collective security arrangements

Mr Mozaffar Ali Khan Qizilbash (Pakistan) said There is a growing feeling among the Asian members of S-EATO that the aid they have received has neither been commensurate with their Treaty obligations nor is it in adequate proportion to the aid received by neutralists from both the camps.

He did not name India as one of the neutralist countries he talked of but left no doubt that he was referring to India

He said It seems there is an understanding between the communists and the so called neutralists While the communists give full diplomatic support to the neutralists in the United Nations and elsewhere and also provide them with substantial economic and military aid the neutralists provide a basis for communist subversion

In a brief reference to the Kashmir question he said I would like to re state with all the emphasis at my command that the continuance of this long standing dispute remains a serious threat to the peace and security of the Treaty area

The US Secretary of State Mr John Foster Dulles, in an obvious reply to Mr Qizilbash s remarks on economic assistance said that USA had poured more than $500 million in non military aid into the economics of the three Asian member nations of S EATO in the four years since the alliance was formed

Mr Richard Casey (Australia) offered £1 000 000 to the Asian members of S EATO in economic aid and said that Australia s policy was to give economic assistance to fellow S-EATO members to enable them to build up their defences The promised £1 000 000 would bring to £3 000,000 the total Australian contribution to the Treaty members in the past three years

The French Foreign Minister M Christian Pineau, said that S-EATO was aimed only at

those who would deliberately assail the liberties of S-EATO nations.

After the opening speeches the Council went into closed session and a communique was issued at the close of the meeting on March 13. Following are excerpts from the communique

"The fourth annual meeting of the S-EATO Council was held in Manila from March 11 to 13, 1958 under the chairmanship of the acting Secretary of Foreign Affairs of the Philippines Mr Felixberto M. Serrano.

"The Council reviewed the world situation with special attention to the Treaty area approved the work of the Organisation since the meeting in Canberra a year ago and considered reports by the Council representatives Military Advisers and the Secretary General The Council welcomed the appointment of Nai Pote Sarasin of Thailand as Secretary General of the Organization.

"The Council considered the continuing communist threat to the region. The Ministers re-affirmed their determination to maintain national and collective defence against the possibility of communist and communist inspired aggression while at the same time earnestly working for international disarmament with *adequate safeguards covering both nuclear* and conventional weapons

S-EATO has become a bulwark which has enabled the countries protected thereby to proceed in peace with their programmes of national development

Members of S-EATO recognized that a threat to security or to freedom in any region of the world was a threat to security and freedom everywhere

The problems of communist subversion in the Treaty area were discussed at length It was recognized that this represented the most substantial current menace

"The Council was of the opinion that collective security measures had resulted in the diversion of the emphasis of communist activities from military to non military field.

"The Council agreed to continue and expand its programme of cultural activities

The United States and the Philippines announced that they intend to co-sponsor a defence college to be located in the Philippines This would be open to members and non members of S EATO"

1958 59 Budget The Council approved estimates totalling $[illegible]0,360 for the financial year 1958-59 to cover the cost of the Secretariat General and Military Planning Office in Bangkok and to finance certain programmes

The Council accepted with pleasure the invitation of the New Zealand Government to hold its next annual meeting in Wellington.

Conclusion. The Council considered the the work of the present meeting had helped to consolidate the work already achieved by S-EATO They placed on record their determination to continue to work together for the security and progress of South East Asia in accordance with the *principles and purposes of* the Charter of the United Nations The Council members again emphasized the defensive character of S-EATO and re affirmed the principle that international disputes be settled peacefully in accordance with the principles of the United Nations Charter

• • •

REBELLION IN INDONESIA

A 'Provisional Government' headed by Dr Sjafruddin Prawiranegara the former Governor of the Bank of Indonesia was proclaimed on February 15 by the Central Sumatran Revolutionary Council (the 'Banteng' Council headed by Lieut Colonel Achmed Hussein) after the Indonesian Government had *rejected an ultimatum demanding its resignation* Central Sumatra had been one of the areas which for some time had demanded greater local autonomy, a fairer share of the national revenue and of the proceeds of their own exports and a strictly non-Communist Government in Jakarta The continued deterioration in the relations between the Central Government and the military administration in Central Sumatra was attributed to the interruption of inter-island traffic caused by the taking over in December 1957 of the Royal Dutch Packet Navigation Company (K.P.M.) which had compelled the provincial administrations to organize barter trade in rubber tea coffee copra and other products with Malaya and Singapore in return for rice consumer goods and equipment Fears of increasing Communist influence in Java and dissatisfaction at the continued non participation of Dr Hatta in the Government, were also believed to have been contributory factors

During January 1958 a number of prominent political figures openly associated themselves with the Revolutionary Council including two former Premiers Dr Mohammed Natsir and Dr Burhanuddin Harahap and two former Finance Ministers Dr Sjafruddin Prawiranegara and Dr Sumitro Djojohadikusumo. (Dr Natsir Dr Harahap

and Dr Sjafruddin are members of the *Masjumi* and Dr Sumitro is a Socialist) Several senior military officers also took refuge in Central Sumatra, among them Colonel Lubis the former Deputy Chief of Staff who had been evading arrest since the fa lure of his attempt in November 1956 to lead a military coup in Java Colonel Simbolon, leader of the abortive coup in North Sumatra in December 1956 and Colonel Djambek a former staff officer

Dr Sjafruddin Prawiranegara had gone to Sumatra on leave in December 1957 and refused to return to Jakarta when summoned by the Government In an open letter to President Sukarno published on January 22 1958 he expressed the opinion that there were only two ways to restore *de facto* authority over the whole of Indonesia—either by establishing 'a national Government which is not only strong but has authority and has been formed according to the Constitution or by asking for Soviet aid He re ected the latter alternative however and appealed to all patriots to safeguard Indonesia from becoming a Soviet satellite He was subsequently dismissed from h.. post as Governor of the Bank of Indonesia

The Revolutionary Council meeting at Padang on February 9 1958 approved an ultimatum calling on President Sukarno to dismiss Dr Djuanda s Cabinet within five days to abandon his policy of guided democracy and to appoint a new Government headed by Dr Hatta and the Sultan of Jogjakarta (a former Defence Minister who resigned in 1953 after the failure of a military *coup* in which he was allegedly implicated) If President Sukarno failed to comply with these demands the Council would regard themselves as no longer bound to obey him as Head of State

The Cabinet rejected the Council s demands on February 11 ordered the dishonourable discharge of Lieut Colonel Hussein and Colonels Lubis Simbolon and Djambek, and placed the military forces in Central Sumatra under the direct command of the Chief of Staff Major General Nasution In a broadcast on the following day General Nasution ordered the arrest of the four Colonels whom he accused of complicity in the attempt to assassinate President Sukarno in November 1957

In view of the Government s refusal to accept its demands the Revolutionary Council proclaimed a rival 'provisional Government at Pandang on February 15 The proclamation stated that the new 'Provisional Government would be prepared to make way at any time for a Government heaced by Dr Hatta and the Sultan of Jogjakarta and that it would carry out its threat to withdraw its recognition of President Sukarno if such a Government were not formed within a reasonable time

Immediately after its formation the rebel 'Government declared the Central Government s assets abro d to be blocked and the signatures of directors of the Bank of Indonesia to be invalid The three oil companies operating in Sumatra—Caltex Royal Dutch Shell and Standard Vacuum—were ordered to discontinue paying royalties to the Central Government and sending oil products from their refineries to Jakarta

Lieut Colonel Somba commander in North Celebes where a separate administration had been set up in January 1958 declared his support for the rebel 'Government on February 17, but no other commander followed his example In South and South East Celebes West Java Central Java Borneo and the Lesser Sunda Islands the military commanders announced their support for the Central Government

Strong measures were taken by the Central Government to meet the threat from the rebels The naval force stationed off the Sumatran coast was heavily reinforced, and on February 17 the ports of Padang and Teluk Bajur (Central Sumatra) and Menado and Bitung (North Celebes) were declared closed Air Communication with North Celebes was suspended on the following day and Dr Djuanda announced on February 21 that an economic blockade would be imposed as one of the Government s measures to subdue the rebels

President Sukarno returned to Jakarta from Tokyo on February 16 five days earlier than he had intended and was greeted by enthusiastic crowds He had talks on February 18 with Mr Suwirjo and Dr Sukiman the respective chairmen of the Nation list Party and the Masjumi and a two-hour meeting on February 20 with Dr Hatta

In a broadcast on February 21 when he resumed his Presidential functions President Sukarno said that the efforts of a certain small group had reached a climax in their attempt to impose their will upon the entire people He claimed that the Central Government had unsuccessfully tried to find a peaceful solution and announced that it would deal

with the new situation firmly and with all the means at its disposal, though it would seek to avoid the use of force

Military operations began on the same day, when Government aircraft bombed a bridge at Painan 43 miles south of Padang The radio stations at Pandang Bukittinggi and Menado (N Celebes) were bombed and temporarily put out of action on February 22

Army headquarters in Jakarta announced on March 11 that the rebels had been cleared from Bengkalis Selat Panjang (an island South of Bengkalis also opposite the mouth of the Siak River) and Sungei Pakning (the oil terminal at the river mouth) The statement claimed that civil servants the police and the local population had proved to be loyal and had given full support to Government

In the early hours of March 12 bombers and fighters of the Indonesian Air Force attacked Pakanbaru in strength after which 300 paratroopers were dropped on the nearby airport from Dakota aircraft, after short but bitter fighting the paratroops cleared the airport, thus making it possible for transport planes to land reinforcements

On March 14, Indonesian Army H Q announced that their forces were in complete control of Pakanbaru its airfield and the surrounding district and had also occupied Dumai on the coast north east of Pakanbaru

Meanwhile the rebellion had spread on March 16 to Medan the capital of Northern Sumatra and the largest town in the island with a population of about 260 000 Pandang radio announced that Medan airport had been captured earlier the same day by Government units which had defected to the rebels after severe fighting with the Air Force garrison at the airport.

On March 17, however the rebel forces were reported to have withdrawn from Medan and Indonesian Army H.Q claimed that the city was again under the control of Government forces which had recaptured Medan airport and had also reoccupied Belawendeli the port of Medan

Warships of the Indonesian Navy had meanwhile shelled various rebel held areas on the west coast of Sumatra at intervals between March 7 and 14

The Indonesian Navy announced on March 26 that mines had been laid along the West Sumatran coast from Painan to Pariaman 30 miles north and south of Padang respectively and that the area had been closed to shipping.

Indonesian Army H Q in Jakarta alleged on March 13 that the rebel forces at Pakanbaru had been receiving arms dropped by foreign aircraft and stated that most of these arms had been captured by the Government forces

Dr Djuanda issued a statement on March 19 declaring that any foreign intervention in connexion with the Sumatran rebellion could lead to developments prejudicial to world peace

The Malayan Government announced on March 18 that its policy was one of strict non-interference as the situation concerned only the people of Indonesia.

The Australian Minister for External Affairs (Mr Casey) said on February 16 that political developments in Indonesia must be regarded at the present stage as a domestic affair but he hoped the Indonesian people would find a peaceful solution

HOME AFFAIRS

Delhi Municipal Corporation

A new chapter opened in the civic history of Delhi from Monday April 7 when the Delhi Municipal Corporation came into being replacing a number of big and small civic bodies which were administered under the outmoded 47 year old Punjab Municipal Act It is the second largest metropolitan area in the world next only to Tokyo

The Corporation is the outcome of the deliberations on the part of the Government of India and agitation by Delhi s political leaders for some kind of an agency where the ambitions and aspirations of the people could be voiced through the elected representatives of the people The need for providing an outlet to the bottled up energies of Delhi s political leaders became important particularly after the Delhi Vidhan Sabha went out of existence following the abolition of Part C States among which Delhi was one

The Corporation has 80 councillors who were elected from the Delhi Union Territory on March 20 The councillors who have now become the electoral college for Delhi s Raj ya Sabha seats have already chosen six aldermen on April 4 and the Mayor Mrs Aruna Asaf Ali was elected on April 14

The Corporation is the biggest in India as its jurisdiction extends to over 520 sq miles of territory A unique feature of the Corporation is that it also manages the affairs of Delhi s rural areas of 300 odd villages The rural area will also continue to be governed by the Delhi Panchayat Raj Act The Corporation however can declare a rural area urban The corporation will serve nearly two million people while the NDMC and the Cantonment Board are left with a population of a little over 200 000 The Corporation s annual revenue will be in the neighbourhood of Rs 17 crores

As has been planned the head quarters of the Corporation will be in Delhi Town Hall from where the Delhi Municipal Committee used to function It is proposed to have zonal offices in Shahadara the Civil Lines West Delhi and South Delhi where at present there are offices for the municipal committees An additional office will be set up in Karol bagh which is the biggest residential area within the Corporation limits

The zonal offices will accept payment for water and electricity and municipal taxes and also attend to public needs and complaints in regard to sanitation, public health, water supply and electricity

Though New Delhi and Delhi Cantonment have been kept outside the Corporation it still has under its control the Delhi Transport Service the Delhi State Electricity Board and the Joint Water and S wage Board The clamour of the political elements to get the Delhi Development Authority under the Corporation and also to get New Delhi and Delhi Cantonment included in it will get support only if the Corporation makes a good showing

The jurisdiction of the NDMC will extend to about 15 square miles approximately half of New Delhi and it will continue to be responsible for maintaining civic services in this restricted area

The Delhi Development Authority will have as its chief function the preparation of the Master Plan It will also operate in certain development areas and may undertake slum clearance work Since two members of the Corporation and the Municipal Commissioner will be on the DDA board the Authority is expected to function in clearly demarcated areas not served by the Corporation

The Chief Commissioner who remains the Administrator of the Union Territory will continue to be responsible for law and order and will have under his jurisdiction such subjects as labour industries sales tax, excise revenue and agriculture But the Administrator s powers will be greatly reduced since the Corporation will have control over road transport and water and electricity services run by two statutory authorities under the chairmanship of the Chief Commissioner Primary education has also been taken away from the local administration to be handed over to the *Corporation*

The Party position in Delhi Municipal Corporation is as follows

	Members	Aldermen
Congress	31	2
Jan Sangh	25	2
Independents	14	2
Communists	8	—
Hindu Mahasabha	1	—
P S P	1	—
Total	80	6

Dr Graham's Report on Kashmir

The U N Representative for Kashmir Dr Frank Graham has recommended a high level conference between India and Pakistan to discuss the "basic differences which the parties find to stand in the way of a settlement" and other matters that might contribute towards implementation of the U N C I P resolutions of August 13 1948 and January 5 1949 This is the only operative recommendation that Dr Graham has made in a brief report to the Security Council, released on April 3 1958

Five other proposals made by the U N Representative to India and Pakistan including the holding of a high level conference or preferably a meeting between the two Prime Ministers were accepted by Pakistan and rejected by India.

Dr Graham's five proposals, submitted to the two Governments on February 15, 1958 the day of his departure from the sub-continent were as follows

(a) The withdrawal of Pakistani troops from Kashmir and the stationing of a U N force within the territory of Pakistan along the Pakistan-Kashmir border to safeguard the security of the evacuated areas of Kashmir which would be administered by the local authorities under the surveillance of the U N Commission pending a final settlement

(b) An appeal by both Governments to their respective peoples to assist in creating and maintaining an atmosphere favourable to negotiations

(c) A reaffirmation by both sides of the integrity of the cease fire line

(d) Early agreement between the two Governments with the assistance of the U N representative on the interpretation that should be placed on Part III of the resolution of August 13 1948 and those parts of the resolution of January 5 1949 which provide for a plebiscite

(e) Further negotiations at Prime Ministers level under the auspices of the U N representative in the early spring" of 1958 or as early as practicable

Dr Graham reports that the Pakistan Government has agreed to these five recommendations in principle but that the Government of India has declared itself unable to accept any one of them

India has objected both to the approach and the substance of the recommendations put forward by the U N Representative

The Government of India's contention is that the recommendations were made without regard to the failure to implement the Security Council resolution of January 17 1948 and Clauses B and E of Part I of the August 13 1948 resolution for which it holds Pakistan responsible (Clause B calls on both sides to refrain from augmenting their military potential in Kashmir and Clause 'E' enjoins both Governments to assist in creating and maintaining an *atmosphere favourable to negotiations*)

The Indian view according to Dr Graham is that the sole onus of performance is on Pakistan and the U N both of whom have the responsibility and the capacity for taking steps towards a peaceful approach

The various recommendations taken together India feels would tend to by pass and evade the main issue of illegal occupation of Indian territory by Pakistan It might be considered to displace previous engagements and condone the violation of these engagements by Pakistan The proposal for "summit talks would further place the aggressor *and the aggressed on the same footing*

Although the Government of India does not object to sovereign nation like Pakistan agreeing to have a U N force stationed on its soil it regrets this recommendation and would for its own part consider it an unfriendly act to promote a suggestion which would involve the stationing of foreign troops in a neighbouring country with which it desires nothing but the most friendly relations

Mr Nehru in a press conference in New Delhi on April 4, ruled out the possibility of a high level conference between India and Pakistan on Kashmir as recommended by Dr Graham in his latest report to the Security Council He said that recent public statements did not indicate the probability of fruitful discussions In any case Dr Graham's proposal that he should sit with the two Prime Ministers as some kind of umpire" was totally unacceptable If there were to be talks these

would take place directly between the representatives of the two countries

He described Dr Graham as a very nice gentleman and full of goodwill who was somewhat entangled in a past period of history The basic facts of Kashmir could not be ignored These were that the State had acceded to India and that Pakistan aggression had not been vacated

* * *

The Rajasthan Canal

A new page in the history of Rajasthan s re construction was turned when the Union Home Minister Pand t Govind Ba'labh Pant in augurated the work on the Rajasthan Canal Project at Tilwara on March 30 1958

For this 425 mile long canal when comp leted at a cost of approximately Rs 70 crores will usher in an era of plenty and prosperity for the people of the State s north western desert area which has been vulnerable to famine death and starvation

Rajasthan s desert area covers nearly 15 mi lion acres of land a third of which is to be benefited by irrigation from the canal.

The desert must have been the outcome of nature s wrath Rivers flowing through the area that cradled the Indus Valley civilisation dried up giving birth to the desert By mak ing waters from the Rajasthan Canal available to this area, man now proposes to restore to the land its erstwhile fertility

Taking off from Harike Barrage on the Sutlej in the Punjab the Rajasthan Canal will run as a feeder for the first 133 miles For nearly 110 miles it will run in the Punjab along the alignment of the Sirhind feeder and then enter Rajasthan a few miles north east of Hanumangarh It will run southwards for the next 23 miles before taking a turn towards south west running almost straight to Nachna in Jaisalmer district Then it takes a westward course to tail off at Ramgarh, about 45 miles north west of Jaisalmer town

The entire Rajasthan desert area lying west of the proposed canal has a natural slope The area thus commanded by the canal aggregates about five million acres, which can be brought under cultivation This area is at present sparsely populated and has practically no cultivation worth the name With the supply of irrigation facilities the area would afford excellent opportunities for the settle ment of numerous farmers

At mile 132 where the canal takes a south westerly turn will take off the low level Suratgarh branch expected to be completed in two years time This 110 mile long branch will irrigate 8 00 000 acres stretching between Hanumangarh and Suratgarh The second Five Year Plan should see the completion of this phase of the project

The remaining part of the project will be completed in another seven years and the fruition of the entire project if everything goes according to the schedule should be achieved in ten years from now

The work on the Punjab portion of the main feeder is to be carried out by the Punjab Government while the rest is to be completed by Rajasthan

Besides the main canal 425 miles in length there will be branch canals totalling in length 500 miles The distributaries and minors will be 6 000 miles long

At its head the Rajasthan Canal will have a tentative capacity of 18 500 cusecs with scope of raising the discharge for lift irrigation

Cheap power generation is also contem plated by construction of two powerhouses on the Suratgarh branch helping rapid industriali sation of the area

Production of long staple American cotton is considered feasible in the area developed by the canal

The canal will arrest the eastward march of the desert

During its construction the canal will provide employment to thousands and later afford them facilities for settling on the land irrigated by it

* * *

Rajya Sabha Biennial Elections

The Congress annexed 31 of the 41 seats results for which were announced in New Delhi on March 24 to the Rajya Sabha from the various State Assemblies

Of the other all India parties the Com munists bagged four seats the P S P two the Jana Sangh and the Socialist Party one each The Indian National Democratic Congress a Madras party claimed one seat while one independent was declared elected from Himachal Pradesh

Among the successful Congress candidates were Pandit Govind Ballabh Pant Union Home Minister Mr G Rajagopalan Parliamentary Secretary Mr Tika Ram Paliwal, a former Chief Minister of Rajasthan, Rajkumari Amrit Kaur former Union Health

Minister and Begum Saddiqa a sitting member from Delhi

Dr Z A Ahmed, a top Communist leader of U P, was one of the prominent Opposition candidates returned from U P

The following were declared elected from Uttar Pradesh

Pandit Pant (Congress) Mr Tarakeswar Pande (Congress) Mr Nawab Singh Chauhan (Congress) Mr Jagan Nath Prasad (Congress) Mr A. Dharam Dass (Congress) Mr Mahabir Prasad (Congress) Mr S D Misra (Congress) Shyam Sunder Narain (Congress) Mr Faridul Haq (PSP) Dr Z. A Ahmad (Communist) and Raja Ajit Pratap Singh (Jana Sangh)

In Punjab the Congress won all the four seats The successful candidates were Rajkumari Amrit Kaur and Mr Jagan Nath (sitting members) Dr Madhoram and Sardar Darshan Singh Pheruman

Five Congressmen including three sitting members and a Praja Socialist were declared elected from Madhya Pradesh The seat which has been won by the P S P has gone to Thakur Niranjan Singh leader of the Opposition in the former Madhya Pradesh Assembly

Those who were elected from M P included Dr Seeta Parmanand Mr Banarsi Das Chaturvedi, Mr Dayal Das Durre Mr V V Saraswati and Mr T D Pustake

In Rajasthan the Congress claimed all the three seats The successful candidates were Mr Hardeo Joshi Mr Tikka Ram Paliwal and Mr Keshavanand

Mr Joshi and Mr Paliwal are sitting members of the State Assembly, Mr Keshavanand has been re-elected to Rajya Sabha having just retired

In Himachal Pradesh Mr Anand Chand (Independent) defeated a sitting Congress member Mr C. L. Verma, by a narrow majority of only two votes in a straight contest

In Kerala, two Communist and a Congressman were elected They are Mr P A Solomon and Mr Subba Rao (Communist) and Mrs Bharathi Udayabhanu (Congress)

In Madras five Congress and one Indian National Democratic Congress candidate were returned Mr H D Raja the only I N D C. candidate secured the maximum of 38 against the minimum

The successful Co[illegible]
T S. Avinasilingam [illegible] gopalan Mr S Chattanatha Karayalar Mr B Parameswaran and Mr N M Lingam

In Andhra Pradesh the Congress won four of the six seats The remaining two seats were shared by the Communist and the Socialist Parties

The successful candidates are Mrs Setha Yudhvir Mr Narla Venkateswara Rao, Mr M H Samuel and Mr S Chenna Reddi (all Congress) Mr K. L. Narasimham (Communist) and Mr A Chakradhar Rao (Socialist)

PARLIAMENTARY AFFAIRS

RESOLUTION ON SCIENTIFIC POLICY

In a resolution placed before Lok Sabha on March 13 by the Prime Minister the Government of India have announced their decision to offer good conditions of service to scientists to give them an honoured position by associating them with the formulation of policies and to take such other measures as may be necessary to promote science and technology

The resolution points out that the key to national prosperity apart from the spirit of the people lies in the modern age in the effective combination of three factors technology raw materials and capital Of these technology is perhaps the most important since the adoption of new scientific techniques can make up for a deficiency in natural resources and reduce the demands on capital The wealth and prosperity of a nation depends on the effective utilisation of its human and material resources through industrialisation

A copy of the resolution was also presented to the Rajya Sabha

Prime Minister s Reply to the Budget Debate

The Prime Minister Shri Nehru replying to a general discussion on the Budget (Central) said in the Lok Sabha on March 18 that the task before India was to convert an agricultural community with hundreds of years of poverty into a highly industrialised progressive and dynamic society He had no doubt that India would succed in her efforts to industrialise and raise her standard of living In spite of difficulties the Second Plan would succeed He had no doubt that there would be *increased* food production

Shri Nehru said while India s economy was strong and she would repay the loans she had taken he was greatly worried and troubled about some forces that had been set in motion inside the country What troubled him was not the economic situation but the things that were being done to disrupt the country in various ways on communal linguistic and provincial grounds

To implement the development plans there was no alternative to high taxes He turned down the demand to raise the exemption limit for income tax The burden of taxation had to be equalised when the country was engaged in building up its economy

On foreign exchange Mr Nehru said in the week ended March 14 instead of a decline there was an addition of 3 68 crores in India s sterling balances About deficit financing Shri Nehru said Government did not wish to go beyond legitimate risks

About public undertakings the Prime Minister said by and large they were doing very well and were run efficiently Their production was increasing Difficulties had however arisen in the private sector where production had gone down He gave figures to show that national income was increasing steadily Between 1952 53 and 1956-57 the *per capita* national income had gone up by nearly Rs 28

Excise Duties on Cloth Reduced

Also in his reply to the discussion on the Budget Shri Nehru announced certain excise reliefs on cloth He said that during the current financial year no deposits would be called for from companies either in respect of accumulated profits and reserves or of current profits

About cloth the Prime Minister said the existing duty on coarse *dhoti* and *saris* is being reduced from 3 125 Np to 3 Np per spuare yard coarse cloth of other varieties from 9 375 Np to 6 Np per square yard

Medium category is being split up into two categories namely *dhotis* and *saris* and other varieties In the case of *dhotis* and *saris* the existing duty of 9 375 Np per square yard is being reduced to 7 Np and on medium and on other sorts from 9 375 Np to 9 Np

In the case of Fine variety the existing duty of 18 75 Np is being reduced to 17 Np

In the case of Super fine the existing duty of 25 Np is being reduced to 22 Np

The Prime Minister said these reduced rates would take effect from to-morrow These proposals would cost the exchequer nearly fifteen crores

Film On Removal Of Untouchability

The Minister for Information and Broadcasting Dr B V Keskar said in the Lok Sabha during question time on March 18 that Government hoped to be able to finalise a script soon for producing a full length educative film on the removal of untouchability He said it was not merely a question of producing a film on untouchability but it should be such that would evoke in those who saw it a kind of disgust for untouchability and help in eradicating the evil

Dr Keskar also said that Government were thinking of having short films on the various aspects of untouchability in addition to this big feature film

The Lok Sabha voted demands for grants for the Commerce and Industry Ministry and the Ministry of Education and Scientific Research

Government s Export Policy

Replying to the debate on the demands of his Ministry the Minister for Commerce and Industry Shri Morarji Desai said on March 20 that Government s export policy was being vitalised from day to day to keep pace with the changing needs of the situation On account of foreign competition it was possible that some of the traditional exports might suffer a set back despite of Government efforts About textile production he said there had been a recession in the industry with the result that the production that had been increasing decreased during the second half of last year Government felt that with the reduction in the excise duties on cloth the production of textiles would rise

Earlier on March 19 Shri Manubhai Shah speaking in the debate on the demands for grants for the Ministry of Commerce and Industry countered the argument of falling industrial output by showing that except for cotton textiles there had been a continuous growth in industrial output in spite of extreme foreign exchange difficulties

Debate On Education Ministry s Demands

Dr K L Shrimali Education Minister replying to the debate on the Education Ministry's Demands For Grants said in the Lok Sabha on March 21 that it would be Government s endeavour to provide universal free and compulsory primary education by the end of the third Five Year Plan for children between the ages of 6 and 11 He announced that the Government had given their final approval to the adoption of the three year degree course by universities He further stated that Government were appointing a special committee under the chairmanship of Mrs Durgabai Deshmukh to survey the question of women education

Dr Shrimali said that next year Government proposed to institute a scheme of national awards for teachers This was intended to give recognition to the services of outstanding teachers who had worked in a spirit of dedication and service

Dr Mono Mohon Dass the Deputy Minister, who intervened in the debate earlier on that day denied that there was any large scale unemployment among engineers All the engineering graduates coming out of colleges were absorbed every year Dr Dass also said that in addition to the existing 18 scientific laboratories and institutions 3 more institutions would be established soon—a Central Mechanical Engineering Research Institute, a Public Health Engineering Research Institute and the Assam Regional Institute

The Lok Sabha voted Demands for Grants fo the Ministries of Health Irrigation and Power and Transport and Communications during the week ending March 28

Family Planning

Replying on March 24 to a five-hour discussion in the Lok Sabha on the budget demands of his Ministry the Union Health Minister Shri Karmarkar said that people had generally accepted the principle of family planning and the response on the whole had been good People had begun to think about this matter seriously and that was a good sign for the success of the programme Shri Karmarkar added that already more than 370 family clinics had begun functioning in different parts of the country Family Planning Officers had been appointed in most of the States Speaking of T B the Health Minister said the recent surveys put the number of those suffering from this disease at about 25 lakhs It was not possible to give treatment to all of them in sanatoria or in hospitals. An experiment was being conducted in Madras to treat patients in their homes

Canal Waters Dispute

The Minister for Irrigation and Power Shri S K Patil said in the Lok Sabha on March 26 that all along India had taken an honourable consistent and good neighbourly attitude to the canal waters question He said India desired to be a good neighbour of

Pakistan Shri Patil said India was ready to pay for the link canals in Pakistan and did not wish to withdraw the water supply unless other arrangements had been made by Pakistan But India would wait only until 1962 by which time she would need the supply for use in the Rajasthan Canal and Sirhind feeder Shri Patil was replying to a debate on the budget demands for the Ministry of Irrigation and Power totalling over 11 crores of rupees

Shri Patil said irrigation and food production were the hardest core of the Plan and they could try to increase the output to such an extent that they might have an exportable surplus worth about 50 crores of rupees

Kidnapping By Pakistani Military Personnel

In the Lok Sabha on March 26 questions were asked about the recent incidents in which Indian nationals were kidnapped by Pakistani military personnel Mrs Lakshmi Menon Deputy Minister for External Affairs, informed the House that in these incidents which occured on March 6 and 7 in all seven Indian boatmen had been kidnapped by Pakistani military personnel who had trespassed into the Indian side of the river Kalindi

Ministry Of Transport And Communications

Replying on March 28 to a ten hour discussion on the budget demands for grants in respect of his Ministry Shri Lal Bahadur Shastri Union Minister for Transport and Communications declared that if it was desired that the P & T Department should be run on commercial lines and should be a profitable concern, it was absolutely essential that more freedom and more autonomy should be given to that Department He hinted that he favoured the creation of a separate Board for the Post and Telegraphs Department on the lines of the Railway Board

Shri Shastri observed that there were three important things which should be done in case we wanted to improve the efficiency of the P & T Department The first is the re organisation of the P & T Directorate at the top level The second is making adequate arrangements for the training of the staff whether new recruits or those who are already in service The third thing which is equally important is a fresh approach in the Directorate towards the workers of the Department

Referring to the new shipyards Shri Shastri said that he would very much like these to be set up within the Second Plan period itself There was a possibility of foreign participation in this project Shri Shastri also said that it might be possible for India to get at least ten new ships from Japan as a result of the recent Yen credit offer by that country He informed the House that the Government had decided to get three ship building technical experts from West Germany

The Minister for Shipping Shri Raj Bahadur who intervened in the debate on March 27, said that road development was hampered by high taxation on vehicles and it was high time that this burden was relieved He said that it was necessary to do two things to achieve a uniform level of taxation for the whole country and to simplify the machinery for the realisation of the taxes

The Lok Sabha voted during the week ending April 3 demands for grants for the Ministeries of works Housing and Supply Steel Mines and Fuel and Food and Agriculture

Coal Production

The Lok Sabha voted on April 2 the budget demands of the Ministry of Steel Mines and Fuel Replying to the debate on the demands of his Ministry S Swaran Singh Minister for Steel Mines and Fuel gave figures to show that existing collieries in the public sector had done extremely well in raising coal production He said the overall coal production in the public as well as the private sectors was 14 per cent higher than the production in 1955 On the basis of arrangements and commitments already made, the expected production from the new collieries coming up in the public sector would be about seven million tons a year

About the Neiveli Project the Minister said its briquette and carbonizing scheme provided a ray of hope to the feeling in the South about the possibility of starting a steel plant there Lignite in certain quantities when pressed in the form of briquette could be used for manufacturing steel The Minister said in the course of time briquette might turn out to be substitute for metallurgical coal for the production of steel in the south

Progress Of Three Steel Plants

Ealier on March 31 inititiating the discussion on Demands for Grants for the Ministry of Steel Mines and Fuel S Swaran Singh gave the House report of the latest progress of the three steel plants under erection. He said he expected the first blast furnance at Bhilai to be ready for operation by the end of this year Two

engineers 500 Indian engineers and over 40 000 people were at work 150 000 tons of Plant equipment and stores had been received from the U S S R About the Durgapur Steel Plant Minister for Steel Mines and Fuel said work was going on according to schedule About 17 000 people were at work under the command of 100 Indian officers Work had started on the first coke ovens S Swaran Singh said the supply position of steel would ease towards the end of the year but in pig iron the country seemed to have crossed the hump

Oil Exploration Programme

Intervening in the debate on April 1 the Minister for Mines and Oil Shri K D Malaviya, referred to the Government s programme of oil exploration and said that the tempo of work would increase this year Exploration for oil was going on from Cambay in the West to Assam in the East The Minister also reported to the Lok Sabha that negotiations were not proceeding satisfactorily between the Government and Oil Companies for a proper reduction in the prices of petroleum products in India The Government had not been about to get any conclusive decision from the oil companies on proposals to reduce the prices

Slum Clearance And Rural Housing Programme

Replying to the debate on the budget demands of his Ministry the Minister for Works Housing and Supply Shri K C Reddy, said in the Lok Sabha on March 31 that the Centre had already sanctioned Slum Clearance Scheme estimated to cost eight crores of rupees He said that so far as the Low Income Group Housing Scheme was concerned, it had been making very good progress The subsidized Industrial Housing Scheme was also gathering momentum

The Minister said he was not satisfied with the Rural Housing scheme In order to do justice to this problem they might require at least 2 000 crores of rupees The problem had therefore, to be tackled on aided self help basis

Government s Food Stock

The Food and Agriculture Minister Shri Ajit Prasad Jain told the Lok Sabha on April 3 that India hoped to conclude a fresh agreement with the United States for the import of wheat under Public Law 480 Shri Jain was replying to the debate on Demands for Grants of his Ministry

Pointing out that the bulk of the country's import of foodgrains now came under P L 480 and was paid for in terms of rupees, and out of this payment 80 per cent was given back to India for being spent for development purposes Shri Jain said it was no small advantage to augment our rupee finance by substantial amounts every year which added to our internal resources

Shri Jain said that he would dare say with a large amount of confidence that during the past years the country s agricultural production—cereals pulses and cash crops had shown a rising trend The agricultural production during the last seven years had gone up by more than 25 per cent

Waste Lands To Be Reclaimed

Speaking in the debate, the Minister of State in the Ministry of Food and Agriculture, Dr Panjabrao Deshmukh said there was a proposal to co-ordinate the Government's efforts to reclaim waste lands with the Bhoodan movement for the benefit of the landless Government had planned for 600 more co-operative farming societies during the current financial year

Government wanted to give larger credit to small farmers A title to property would not be insisted upon as being the asset against which the credit was given Government was prepared to take into consideration the crop that was likely to be raised in his field

Mahatma Gandhi s Samadhi

The Deputy Minister for Works, Housing and Supply Shri A.K Chanda said in the Lok Sabha on March 31 that at a rough estimate the cost of the construction of Mahatma Gandhi s Samadhi at Rajghat might be approximately seventy lakhs of rupees spread over a period of about five years He said the architects were expected to submit details in about six months and work would begin thereafter

The Demands for Grants for the Ministries of Community Development Information & Broadcasting, Labour and Employment External Affairs and Rehabilitation and for Department of Atomic Energy were voted by the Lok Sabha during the week ending April 11

Shri Nehru s Statement on Foreign Policy

Initiating the debate in the Lok Sabha on the Demands for Grants for the External Affairs Ministry Shri Nehru said on April 9 that India s relations with other countries were carried on 'on a remarkably friendly level",

(Continued on page 412)

Ambassador to Yogoslavia He will take charge in May 1958

Mr I.S Chopra Indian Ambassador to Sweden appointed Ambassador to Baghdad He will take the new assignment in July 1958

Dr Arno Halusa Austrian Minister designate presented his credentials to President of India in New Delhi on April 9

Mr P A Gopalkrishnan took over as chairman of the Life Insurance Corporation from Mr G.R Kamath on April 10

Mr R C Radjwade arrived in Tunis on April 8 to take charge of India s first Charge d Affairs in Tunisia

OBITUARY

Mr Charlie Kunz (61) American born Pianist died on March 16 at Middleton on sea (Sussex)

Mr Henry Noel Brailford (84), Socialist author and journalist died in London on March 23

Don Hartman (57) who produced the Bing Crossly Bob Hope Road films died at Palm Springs (California) on March 23

Lord Maugham (92) a pre war Lord Chancellor and elder brother of Somerset Maugham died at Chelsea on March 23

Justice S R Temdolkar (59) a senior Judge of the Bombay High court, died in Bombay on March 26

Mr A C Malhotra (56), Chief Engineer of the Kosi Project died in Patna on March 27

Alessandro Cardinal Verde (93) oldest Prince of the Roman Catholic Church died on March 29 in Rome

Mr Cly Pangborn who flew non-stop across the Pacific from Tokyo to Washington State in 1931 died in New York on March 29

Lord Campion (75) Clerk of the House of Commons (1937 to 1948) and Britain s greatest authority on Parliamentary procedure, died in Surrey on April 6

REWARDS PRIZES etc

The Supreme Council of the Portuguese Red Cross awarded on March 15 the Red Cross of High Merit to Rajkumari Amrit Kaur President of the Indian Union Red Cross and the Red Cross of Merit to Sardar Balwant Singh Puri Secretary General of Indian Red Cross

VISITORS ARRIVALS etc

The Prime Minister of New Zealand, Mr Walter Nash arrived in New Delhi on March 17, on a two day State visit to the Capital

Dr Arno Haluse Minister designate of Austria in New Delhi arrived in New Delhi on March 28

(Continued from page 410)

and that the broad policies of the Government had the approval of large sections of the House and of the country

At the present moment, Sri Nehru continued, the most important question facing the world was the problem of disarmament as this was likely to affect the whole future of the world The most outstanding event of the last few months had been the proposal made on behalf of the Soviet Government or rather their decision not to have nuclear test explosions This had been criticised on the ground that having just finished a vast number of tests they could afford not to have them for some time That might be true but such criticism could always be advanced against any action Shri Nehru added A good step is a good step however it may come into being We must welcome and indeed the country has welcomed this step of the Soviet Government in regard to the stoppage of nuclear tests

Indo-Pakistan Relations

The Prime Minister said as regards Indo-Pakistan relations a long list of outstanding issues could be made out—Kashmir canal waters exodus from East Pakistan and financial issues. While some of the minor issues might have been solved by and large none of our major problems had come towards solution which was most distressing While in India both the Government and the leaders of all parties had deliberately aimed at avoidance of conflict and creation of better relations with the people of Pakistan in Pakistan the leadership had not done that Instead stress had been laid on perpetuation of the conflict It was wrong to think that once the Kashmir issue or any other outstanding issue was settled all would be well. So long as the persent anti Indian approach continued it just did not matter what you settled and what you did not settle Unless the basic approach was changed there would always remain fresh issues to be resolved.

NEWS DIARY

MARCH

14 Mr Khrushchev in an election speech in Moscow warned the United States to keep its hand off Russia s East Europen allies or risk war

The U S Atomic Energy Commission announced in Washington that Russia has conducted two more nuclear tests but neither in megaton range (A megaton is the equivalent of a million tons of T N T and generally indicates a hydrogen weapon)

15 The Soviet Government said it will consider President Eisenhower s proposal for the control of outer space only if the U S agrees to discuss the liquidation of U S Military bases in Europe and West Asia.

The first group of withdrawing Chinese volunteers left North Korea by train for home

In an interview with a monthly magazine in Karachi President Iskandar Mirza reiterated his personal view that presidential form of government alone as against the present parliamentary form suited Pakistan

The Lebanese Premier Mr Sami Solh (whose cabinet resigned on March 12) formed a new 14 man cabinet including six former ministers

16 The U S rejected as wholly unacceptable Russia s offer to accept President Eisenhower s space for peace plan in exchange for the elimination of U S overseas bases

16 Medan the capital of North Sumatra province fell to Indonesian revolutionary forces after seven hours of fighting

President Tito of Yugoslavia addressing a public meeting in Belgrade accused the Western Powers of trying to sabotage East West summit talks

An All India Shia Convention in New Delhi declared that Jammu and Kashmir State was an integral part of India and the State s accession to India was final and irrevocable legally and constitutionally

Addressing a meeting at Aleppo (Syria) President Gamal Abdel Nasser pledged all out support to Arab liberationists in every part of the Arab fatherland in their struggle to free all Arab countries from imperialism foreign intervention or domination '

17 The U S Navy put its Vanguard satellite into orbit around the earth from Cape Canaveral Florida

Discoveries and Inventions

PHYSICS

1687—*Newton* Law of gravity
1785—*Coulomb* Fundamental laws of electrical attraction
1798—*Thompson* (Baron Rumford) Mechanical theory of heat
1815—*Fresnel* Diffraction of light
1840—*Joule* Measurements of electric current
1847—*Helmholtz* Law of conservation of energy
1873—*Maxwell* Electromagnetic theory of light
1896—*Becquerel* Discovery of radioactivity
1897—*Wilson* Development of cloud chamber to detect sub-atomic particles
1897—*Thomson* Discovery of electrons
1901—*Planck* Quantom theory
1902—*Michelson* Velocity of light.
1905—*Einstein* Special theory of relativity
1911—*Rutherford* Theory of atomic nucleus
1913—*Bohr* Electron theory
1924—*De Broglie* Wave nature of the electrons.
1931—*Lawrence* Invention of the cyclotron
1932—*Chadwick* Discovery of the neutron
1932—*Anderson* Discovery of the positron
1934—*Fermi* Use of slow neutrons in atom smashing
1938—*Hahn* Discovery of uranium fission
1941—*Fermi* et. al Atomic pile for generation of power

ELECTRICITY

1745—*Von Kleist* Leyden jar condenser
1752—*Franklin*—Lightning rod and the nature of lighting
1791—*Galvani* Theory of animal electricity
1800—*Valta* Current electricity and electric battery
1826—*Ohm.* Laws of electrical resistance
1828—*Henry* Electro-magnetism and induction.
1831—*Faraday* Electromagnetic induction

1832—*Morse* Electric telegraph perfected
1832—*Gauss* System of absolute electric measurement.
1838—*Page.* Induction coil.
1870—*Gramme* First industrial dynamo
1876—*Bell* Telephone
1878—*Crookes* Discovery of cathode ray
1878—*Edison.* First electric incadescent lamp
1885—*Stanley* Electric transformer
1892—*Tesla* Alternating current motor,
1892—*Steinmetz* Laws of alternating current.
1895—*Roentgen.* Discovery of X rays
1896—*Marconi* Practical wireless
1897—*Thomson* Isolation of the electron
1904—*Fleming* First diode radio tube
1907—*De Forest* Triode radio tube.
1914—*Collidge* Tungsten filament lamp
1925—*Baird* Televisor, precursor of televison
1945—*Atom Bomb*

CHEMISTRY

1766—*Cavendish* Discovery of Inflammable air (hydrogen) as distinct substance Also demonstration (1781) that it burned to form water
1774—*Priestley* Discovery of oxygen
1783—*Lavoisier* First quantitative synthesis of water
1803—*Dalton* Atomic theory laws of chemical combination
1809—*Gay Lussac* Law of gases
1811—*Avogadro* Molecular hypothesis.
1828—*Wohler Liebig* Synthesis of urea, foundation of organic chemistry
1841—*Faraday* Induction of electric current
1860—*Bunsen Kirchhoff* Invention of the spectroscope
1868—*Lockyer* Discovery of helium on the sun by use of spectroscope
1869—*Mendeleev* Periodic table of elements, established families of elements.
1887—*Arrhenius.* Ionic dissociation of solution
1896—*Becquerel* Radioactivity of uranium.
1899—*Curie* Discovery of radium
1903—*Onnes* (Kamerlingh) Liquefaction of helium
1912—*Laue Bragg* X Ray structure of crystals.
1913—*Moseley* Atomic numbers
1919—*Aston* Mass spectroscope for separation of isotopes.
1932—*Urey* Discovery of deuterium
1934—*Joliot Curie* Artificial radioactivity

CHEMISTRY

1650—*Glauber* Manufacture of hydrochloric acid
1839—*Goodyear* Process for vulcanizing rubber
1846—*Schonbein* Invention of guncotton
1856—*Besemer* Air blast converter for manufacture of steel
1858—*Hofmann.* Discovered aniline in coal tar aniline dyes
1861—*Solvay* Manufacture of soda from salt.
1862—Nobel Invention of dynamite
1873—*Linde* Introduced ammonia refrigeration
1886—*Hall.* Manufacture of aluminium by electrolytic action
1891—*Frasch* Method for mining sulphur
1908—*Baekeland* Phenol formaldehyde resins (Bakelite)
1913—*Haber* Synthesis of Ammonia from nitrogen and Hydrogen.
1915—*Langmuir* Tungsten filaments
1923—*Midgley* Tetraethye lead gasoline
1930—*Carothers.* Nylon plastic.
1930—*Ipatieff* High-octane gasoline
1930—*Corothersand Collins* Neoprene, synthetic rubber.

PHYSIOLOGY AND MEDICINE

1628—*Harvey* Circulation of blood and function of the heart.
1665—*Hooke* Observation and naming of "cells
1675—*Leeuwenhoek.* Observation of bacteria by microscope
1688—*Redi* All life comes from life.
1737—*Linnaeus.* System for classifying plants and animals.
1768—*Spallanzani* Disproved spontaneous generation.

1796—*Jenner* Vaccinatian for smallpox.
1819—*Laennec* Invention of stethoscope
1839—*Schwann* All living matter composed of cells
1842—*Long* First to use ether as anesthetic in surgery (Jackson, Morton and Long first disputed use of ether)
1859—*Darwin* Evolution and theory of natural selection.
1865—*Mandol* Laws of heredity
1867—*Lister* Antiseptic Suregery
1882—*Metchnicov* Function of white blood corpuscles discovered
1882—*Pasteur* Robies preventive
1882—*Koch.* Tuberculosis bacteria discoveredt
1892—*Weismann.* Developed theory of germ plasm in heredity.
1894—*Kitazato* Discovery of bacillus of plague
1894—*Roux* Perfection of diphtheria antitoxin
1897—*Eijkman.* *Cause of beriberi vitamin deficiency*
1900—*Reed* Cause of yellow fever
1900—*Dr Vries* Nature of mutations and their role in heredity
1901—*Takamine* Isolation of adrenaline, first hormone isolated.
1905—*Binet* Intelligence tests
1906—*Wassermann* et al Test for syphilis.
1907—*Shull* Development of hybrid corn
1907—*Willstatter* Constitution of chlorophyll.
1908—*Freud* Doctrine of psycho-analysis
1909—*Morgan* Theory of the gene and detailed mechanics of heredity
1910—*Pavlov* Mechanism of the conditioned reflex
1912—*Cushing* Relation of pituitary gland to growth
1912—*Ehrlich.* Salvarsan
1913—*Goldberger* Cause and control of pellagra.
1913—*Schick* Test of suceptibility to diphtheria
1913—*Mc Collum* Isolation of vitamin A
1922—Bantin *Macleod* Inauline for treatment of diabets
1924—*Teenbock.* Production of vitamin by ultraviolet radiation.
1926—Minos *Whipple* and *Murphy* Liver treatment of anemia.

1932—*Domagk* Sulfa drugs as bactericides
1936—*Stanley* Molecular nature of viruses
1946—*Du Vigneaud* Synthetic penicillin.
Dr Selman Streptomycin

MECHANICAL

1450—*Gutenberg* Movable type
1560—*Porta* Camera obscura.
1608—*Lippershey* Telescope.
1643—*Torricelli* Barometer
1658—*Huygens* clock
1752—*Franklin.* Lightning rod
1769—*Watt* Steam engine patented
1783—*Montgolfier* Hot air balloon
1785—*Cartwright* Power loom
1786—*Reed* Machine cut nails
1787—*Fitch* Steamboat
1793—*Whitney* Cotton gin mass production of interchangeable gun parts 1798
1797—*Newbola* Cast iron plow
1807—*Fulton* First successful steam boat
1814—*Neepa* Photograph
1816—*Davy* Miner's safety lamp
1819—*Laenrec* Stethoscope
1827—*Walker* Friction matches
1829—*Stephenson* First successful steam railroad
1829—*Braille* Alphabet for the blind
1831—*Faraday* Dynamo-electric machine
1842—*Mac Millah* Bicycle
1833—*Cormick* Reaper
1835—*Colt* Revolver
1837—*Morse* Telegraph
1841—*Ersson* Screw propeller
1842—*Long* Ether as an anesthetic
1842—Macmillan Bicycle
1844—*Goodyear* Vulcaniezd rubber
1846—*Hoe* Rotary printing press
1846—*Hower* Sewing machine
1851—*Ruhmkorff* Induction Coil
1852—*Otis* Improved power elevator
1856—*Bessemer* Steel

h perfected

1912—*Laue Bragg* X Ray structure of crystals

1913—*Moseley* Atomic numbers

Mass spectroscope for separation of isotopes

of deuterium

and is as broad as the white strip It is dark blue and has 24 spokes

The National Flag was adopted by the Constituent Assembly of India on July 22 1947 and was presented to the nation on behalf of the women of India at the midnight session of the Assembly on August 14 1947

Significance of the Colours of the Flag

Dr Radhakrishnan gave philosophical interpretation of the colours of the National Flag when on July 22 1947 a resolution was moved by Pandit Jawaharlal Nehru in the Constituent Assembly on the adoption of the National Flag of India. Saffron colour, he said denotes renunciat on or disinterestedness, our leaders must rise above material gain and dedicate themselves to the ser vice of the motherland The white in the centre is light, the path of truth to guide our conduct. The green shows our relation to the soil 'Our relation of the plant life here on which all other life depends' The Asoka wheel in the centre of the white band represents the wheel of the Law of Dharma 'Truth or Satya, dharma or virtue he said ' ought to be the controlling principles of all those who work under this Flag Again, the wheel stands for motion There is life in movement and death in stagnation India must move and go forward

Use Of The Flag

The Ministry of Home Affair and the Defence Forces Headquarters have drawn up regulations to ensure the proper use of the Flag The regulation prohibit the dipping of the Flag to any person or thing The regi mental colour the State flag the organisational or institutional flag will be used for this purpose when necessary

No other flag or emblem should be placed above the National Flag or to its right All flags are placed to the left of the National Flag if they are hung in a line When other flags are raised, then the National Flag must be the highest.

When other flags are flown along with the National Flag on the same halyard the latter should at the peak. The Flag should not be carried flat or horizontally, but always aloft and free. When carried in a procession it must be borne high on the right shoulder of the standard-bearer and carried in front of the procession

When the Flag is displayed from a staff projecting horizontally or at an angle from a window sill, or a bal cony or the front of a building the saffron end should be at the top

Display On Buildings

Normally the National Flag should be flown on all important government buildings such as high courts, secretariats commissioners offices collectorates jails and the offices of district boards and municipalities. The President of the Indian Republic the Governors and Rajpramukhs have their personal flags

The use of the Flag will however, be unrestricted on certain social occasions such as Independence Day, Mahatma Gandhi s birthday, during the Nationol Week and other days of national rejoicing

NATIONAL ANTHEM

The song Jana gana mana was adopted as the National Anthem of India on January 24, 1950 It was concurrently decided that Vande Mataram which has played a historic part in India s struggle for freedom shall have an equal status

It was on December 27, 1911 that Rabindranath Tagore s Jana gana mana was first sung during the Congress session at Calcutta In January, 1912 it was published under the title Bharat Vidhata in the Tattva bodhini Patrika, of which Tagore was himself the editor The poet translated it into English in 1919 under the title Morning Song of India' The Song consists of five stanzas The first stanza, which has been adopted by the Defence Forces and is usually sung on ceremonial occasions, reads as follows —

Jan-gana adhinayaka jaya he
Bharat-bhagya-vidhata
Punjaba-Sindhu-Gujarata Maratha-
Dravida Utkala Banga
Vindhya Himachala Yamuna Ganga
Uchchala-jaladhi taranga
Tava subha name jage
Tava subha asisa mange
Gaye tava jaya gatha
Jana gana mangal-dayaka, jaya he
Bharat bhagya vidhata
Jaya he jaya he, jaya he
Jaya jaya jaya jaya he

The following is an English rendering of the stanza by Rabindranath Tagore :—

Thou art the ruler of the minds of all people
Thou Dispenser of India's destiny
Thy name rouses the hearts of the Punjab, Sind,
Gujarat and Maratha of Dravid Orissa and Bengal,
It echoes in the hills of the Vindhyas and Himalayas
Mingles in the music of Jammuna and Ganges,
and is chanted by the waves of the Indian Sea
They pray for thy blessing and sing thy praise,
Thou Dispenser of India's destiny,
Victory, Victory, Victory to Thee

Vande Mataram

Vande Mataram is an older song than Jana gana-mana and occurs in Bankim Chandra Chatterjee's novel 'Ananda Math' published in 1882. The first political occasion on which it was sung was the 1896-session of the Indian National Congress. The following is the text of its first stanza :—

Vande Mataram !
Sujlam, suphalam malayaja shitalam
Shasyashymalam Mataram !
Shubhrajyotsna pulakitajaminim
Phullakusumita drumadala shobhinim,
Suhasinim sumadhura bhashinim
Sukhadam Varadam Mataram !

The following is an English translation of the stanza by Sri Aurobindo :—

I bow to thee Mother,
Richly watered, richly fruited
Cool with the winds of the South
Dark with the crops of the harvest,
The Mother !
Her nights rejoicing in the glory of the moonlight,
Her lands clothed beautifully with her trees in
Flowering bloom sweet of laughter, sweet of speech,
The Mother, giver of boons giver of bliss.

Geographical Wonders in India

Largest Lake	Wulur Lake Kashmir
Largest River	Brahmaputra
Longest Road	Grand Trunk Road 1500 miles
Highest Tower	Kutub Minar Delhi
Largest City	Calcutta 29 82 307
Highest Waterfall	Gerssoppa Waterfalls, Mysore (960 feet)
Largest Mosque	Jama Masjid Delhi
Largest Bridge	Sone Bridge Bihar (10 052 ft)
Largest Gate	Buland Darwaza Fatehpur Sikri Agra (176 ft)
Longest Platform	Sonepur, Bihar (10 052ft)
Longest Corridor	Rameshwaram Temple (4 000 ft)
Tallest Statue	Ggmeteswara, Mysore (55 ft)
Wettest Place	Cherrapunji 424 inches
Hottest Place	Barmer (Rajasthan)
Largest Caves	Ellora Bombay
Finest Building	Taj Mahal Agra
Largest fair	Sonepur fair Bihar
Densest Population	Kerala 1 115 5 persons per sq mile
Largest Delta	Sunderbans (8 000 sq miles)
Largest Dome	Gol Gumbaz Bijapur
Largest State in Area	Bombay 190 919 sq miles
Largest State in Population	Uttar Pradesh 63 215 742
Smallest State in Area	Kerala 15035 sq miles
Smallest State in Population	Jammu and Kashmir 4,4000,000
Most Well-planned City	New Delhi
Biggest Library	National Library Calcutta
Biggest Museum	India Museum Calcutta
Largest Zoo	Alipur Zoo Calcutta
Longest Canal	Sharda Canal, Uttar Pradesh
State with largest forest area	Assam
Longest Cantilever Span bridge	Howrah bridge
Oldest Bridge	Iron bridge across Gomti, Lucknow

CERTAIN WONDERS OF NATURAL LIFE

The bird that never builds its nest	Cuckoo
The mammal that lays eggs	Drickilled Platypus
The bird that hatches eggs while standing	Penguin
The bird that lays the greatest number of eggs at a time	Partridge
The tree which gives us the Cricket bat	Willow
The wood that is used in Hockey Sticks	Ash
The animal that can shake off its own tail	Lizard
The bird that lays the smallest eggs	The Golden crested Wren
The animal which gives us the Catgut used in Tennis Rackets	Sheep
The metal which is liquid at normal temperature	Mercury
The largest animal without backbones	Giant Squids that live in the North Atlantic
The animal that makes the rock in the sea	Coral
Smallest animal in existence	Sea anemones
The little Gentleman in velvet	Mole
The animal that can conti	

...nue without water for a number of days	Camel
The animal that hides itself in sand when attacked	Ostrich
The animal that carries its young ones in its pouch	Kangaroo
The tallest animal	Giraffe
The Greatest Tree Giants	Red woods in the forests of California, 20 ft in diameter and 340 ft high
The insects that build sky scrapers	White ants or termites
The animals that give us sweet honey	Bees
The worms that give us a valuable textile	Silkworm
Cannibals in the insect world	Praying Mantis
The tree that weeps	Laurel tree on the Canary Islands
The animal that has a mixture of camel and leopard	Giraffe (Camelopard)
The appearance of the flame above the ground in marshy places	Will O the wisp
The wingless bird	Apteryx or Kiwi (New Zealand)
Animals that kill their prey with their claws and teeth	Lions Tigers and Leopards
Animals that chew up large bones	Hyenas
Largest animal on land	Elephant
The animal that gives us ivory	Elephant
The land animal with the largest mouth	Hippopotamus
Animal of Tropical dignity and impudence	Rhinoceros
The animal with a scornful look	Bactrian camel
Largest Antelope	Eland (S-E Africa)
The only wild monkey found in Europe	Barbary Ape
Terror of the monkey world	Mandrill
The animal whose eyes are used by natives as charms	Loris
Largest Mammal	Whale
Birds that walk about like crippled old men	Penguin
The bird that is imprisoned by her mate at nesting time	Hornbill.
The bird that is bred for its tail feathers	Ostrich
The animal that remains inactive for six months	Polar Bear

SEVEN WONDERS OF THE ANCIENT WORLD

1. Pyramids of Egypt
2. Hanging Gardens of Babylon (a series of terraced gardens rising 300 ft. above the ground
3. Temple of Diana at Ephesus
4. Statue of Jupiter by Phidias at Olympia
5. Colossos of Rhodes (a gigantic statue of Bronze over 100 ft high)
6. The Tomb of Mausolus at Halicarnassus.
7. The Lighthouse of Alexandria, 400 ft high built by Ptolemy

SOME WONDERS OF THE MODERN WORLD

1. Great Wall of China
2. Catacombs of Alexandria
3. Leaning Tower of Nanking
4. Porcelain Tower of Nanking
5. Tajmahal at Agra
6. Mosque of St Sophia at Constantinople
7. The Great Pyramid of Cheops at Giza Egypt.

REGULAR FEATURES

SMALL FEATURES

In 1901 the Government appointed a Committee and it was in accordance with its suggestion that the Act of 1904 was passed This Act aimed at the encouragement of thrift, self help and co-operation among agriculturists artisans and persons of limited means But this Act provided only for Credit Societies Thus unlike in other countries Credit Societies developed first in India

The Co-operative Societies Act of 1912 was the next landmark This Act was passed to remove the basic defects of the 1904 Act It widened the scope of co-operative movement and provision was made for the establishment of societies dealing with different problems Thus societies for the sale of produce purchase of silk and manure cattle insurance and milk supply etc. began to develop

The Reforms Act of 1919 based on the report of the Maclagan Committee made co-operation a provincial subject The outcome of this legislation was the establishment of Provincial Co-operative Societies

In 1929 the All India Co-operative Conference of provincial institutions and banks was formed This non-official organization of co-operative societies has played a major part in the development of co-operation in India

In 1949 took place the merger of the conference of Registrars of Co-operative Societies and the All India Co-operative Conference of provincial institutions and banks This has effected greater harmony between the official and nonofficial sectors and ensured a sound basis for Indian Co-operative Movement. At present co-operation in India embraces credit marketing and banking activity

Co-operative Credit Societies Co-operative Credit Societies—especially rural credit societies—constitute the basis of Indian Co-operative Movement. As the late Dr B V N Naidu put it, "the co-operative movement is essentially a credit movement and agricultural credit societies dominate the picture

But Co-operative Credit Societies have failed to keep pace with the fast growing credit requirements of the agriculturists As the Gorwala Committee Report has put it there is a startling inadequacy in co-operative credit." Co-operative credit current as it may appear satisfies only 3 1% of the total volume of rural borrowing

Bureaucracy, inefficiency and weakness of the primary society appalling ignorance of the members incompetent management, exorbitant interest rates—these in short account for th[illegible]

"The combined impact of commercial colonialism industrialization and urbanisation on the Indian rural structure , to quote Agricultural Credit Survey Report, is another major retarding factor

Co-operative Marketing Societies An efficient system of co-operative Marketing is essential to ensure the smooth working of any co-operative activity

Co-operative Marketing Societies can contribute substantially to the easing of marketing difficulties and thus has certain definite advantages over other types of marketing This type of marketing is suited to the conditions existing in India where the individual producer is a small unit Co-operative marketing ensures improved marketability of products improved bargaining power steadier supply to the wholesale market control of the flow to the market cheaper finance training in business methods etc.

Co-operative Marketing is the most important form of non credit co-operation in India. It has also achieved some success But there are various defects in its working and they have to be remedied to forge an efficient marketing system.

Co-operative Farming Co-operative marketing is closely allied with Co-operative Farming and of late it has assumed a new significance in Indian Economy There is acute controversy as to the suitability of Co-operative Farming to Indian conditions. But the framers of our Five Year Plans have recognized the necessity of introducing and popularising Co-operative System of Farming

Four types of Co-operative Farming are in vogue (1) Co-operative Joint Farming (2) Co-operative Better Farming (3) Co-operative Tenant Farming (4) Co operative Collective Farming Of these the first and the last types are not popular in India The other two types are practised in U P and Madras But Co-operative Farming has made no marked progress in India except in Bombay, U.P and Madras

The progress and spread of Co-operative farming in India are retarded by various difficulties The ignorance of the farmer and the consequent difficulty in convincing him of the advantages of co-operative farming are mainly responsible for the lack of progress

Co-operative Banking

Co-operation has also extended to the field of Banking in India. The progress registered in th[illegible]

it has failed to keep pace with the fast growing requirements of the people The rates of interest charged by the Co-operative Banks on their lendings are very high and hence the people are reluctant to approach these banks for credit

The high rate of interest charged by the Co-operative Banks according to Prof P C. Jain is the outcome of the following causes "(i) Co-operative Societies have generally failed to raise enough local deposits and to encourage thrift (ii) The central co-operative banks except in Bombay and Madras are generally small and uneconomic units with high administrative costs and can survive only by keeping high margin between their borrowing and lending rates and (iii) The various state governments which are assisting the movements by granting loans and subsidies are finding it increasingly difficult to raise the necessary funds from the money market and to make it available at low rates of interest for various co-operative activities "

Under The Plans

At the close of the First Five Year Plan Co-operative Movement embraced a little over 20 p c of the total population In 1956 the Co-operotive Movement included 22 State Co-operative Banks, 499 Central Banks and Banking Unions 126,954 primary credit societies and 9 Central and 291 Land Mortgage Banks At the primary level besides agricultural credit societies there were 30 306 agricultural Non-credit Societies and 21,137 non agricultualtual non credit socieites The primary Agricultural Credit Societies have a total membership of 5 8 million and non credit societies of 2 7 million

The programme of Co-operative development envisaged in the Second Plan indicates the important role accorded to it It is proposed to pump into the Rural Credit System a sum of Rs 225 crores every year during the whole period of the Second Plan The Plan aims at setting up by the end of 1960 61 about 12 000 large sized societies and 5 000 godowns After the absorption of some of the existing societies into the large-sized societies it is expected that one lakh out of the one lakh and a quarter existing societies would continue to survive About 20 new Central Banks will be opened and the existing Central Banks will be strengthened by increasing the share-capital and supply of qualified staff

The Apex Banks will be strengthened to meet the increased needs of rural credit The rate of interest is proposed to be reduced to a uniform level of 6½ p c.

The cost of implementing the entire programme during the Second Plan period would come to Rs 25 crores for the Reserve Bank and Rs 50 crores to the Central and State Governments This would be in addition to the short medium and long term credit which would be available from the Reserve Bank of India

Current Trends

The sphere of co-operation is gradually widening In the beginning it was solely a credit movement Subsequently co-operative marketing came under its fold Co operative Banks Purchase and Sale Societies Producers Societies Consumers Societies and Multipurpose Societies have also made their appearance eventhough on a very small-scale The organization of Co-operative Farming Societies marks the latest trend in Indian Co-operative Movement

The prominent role given to co-operation both in the First and Second Five Year Plans is a definite pointer to the increasing faith of our planners in its potentialities as an instrument of economic advancement Planning Commission has recognized the role of co-operatives in the formation of capital and reorientation of rural life It is also considered as an important source of rural credit Second Five Year Plan has also placed reliance on it as an effective agency of marketing

These trends indicate that co-operative movement has made its impact [fielt on Indian economy But, then, our analysis of the actual working of the major types of co-operatives revealed the numerous defects which hinder their rapid growth and development Thus Indian Co-operative Movement is now in a dilemma What is the way out of this unhappy predicament ? The report of the Agricultural Credit Survey Committee strongly suggests that greater *Governmental participation* is indispensable to revitalise and regenerate Indian Co-operative Movement This is certainly not a correct approach to the co-operative Movement and in a recent address Pandit Nehru has challenged the very validity of this suggestion Rightly has he pointed out that such an appoach is the outcome of a lack of reliance in the abilities of our masses In fact it runs counter to the basic spirit of co-operation.

Co-operative Movement In a New Perspective :

An altogether fresh approach alone can

remedy the inherent defects of the movement and effect a thorough reorganisation in its structure In fact many of the shortcomings of the existing pattern of Indian co-operation can be directly attributed to the wrong approach pursued so far

A survey of the inception of Indian Co-operative Movement clearly reveals that it is essentially a state sponsored movement It was not the result of the gradual and steady unfolding of the ambition of the common masses to awake, arise and organize It was not a natural and spontaneous flowering, but, it was imposed on the people from above Hence the people never felt that the movement was evolved for their benefit and so were very reluctant to associate themselves with it

Since the movement was the upshot of state activity, it assumed a completely bureaucratic pattern It has been repeatedly pointed out that our co-operative Movement is highly officialised. The Registrar is the very pivot of co-operative societies and the registration of a society the supervision of its working and its winding up if it does not work well are all his statutory functions As the late Dr V N Naidu tersely put it the Registrar is the 'Brahma, Vishnu and Siva of Co-operative Societies in India. Sir Horace Plunkett summed up the whole situation correctly in his statement that co-operation in India is *not so much a movement as a governmental policy*

All this clearly indicates that the basic malady of our Co-operative Movement is the high degree of officialdom and bureaucracy which entangle and encircle it. This vicious circle has to be broken to bring about real progress in the movement

The entire problem has to be viewed in this new perspective The working of co operatives in foreign countries gives support to our thesis that the co-operative movement should be essentially a people's movement Thus in countries like Germany and Ireland Co-operative Societies were organised by co-operative enthusiasts like Raiffeisen and Horace Plunkett They instilled in the minds of the people an ardent desire for co-operative endeavour A similar attitude has to be cultivated in the minds of Indian masses. To effect this the co-operative movement should be left to function uninterrupted It should be provided with an atmosphere free from governmental intervention and regulation The salvation of Indian Co-operative Movement in short, lies in the democratisation of its structure

U.S scientists in Antarctica recently reported the lowest natural temperature yet recorded on earth 102.1 degrees below zero Fahrenheit (—73 75 centigrade).

The Soviet Union actualy has contributed nothing to the United Nations Relief and Works Agency for Palestine refugees in the Near East (UNRWA) upon which most Arab refugees depend entirely for food and shelter

The Caspian Sea is not a sea It is the world's largest lake

Educational Value of Broadcasts to Schools

By C L KAPUR

NEW devices whatever their intrinsic value take time to establish themselves Inertia prejudice laziness to understand the significance of the new device combine to impede their ready adoption Occasionally they produce the impression that they are cheap and spurious substitutes for the genuine stuff—mere tinsel parading as gold

A broadcast is not a lesson though it has the same purpose Like a good lesson again, a good broadcast inspires inquiry and investigation and gives appetite for further learning But in concept and structure a broadcast is fundamentally different A lesson grows spontaneously according as the situation develops in the class room It grows in the process of being given The whole course of it and even its content may be materially altered by an unforeseen question

A school broadcast on the other hand is pre fabricated It is planned and scripted beforehand Planning implies team work over a span of time Often it is prerecorded But though scripted it is written to be spoken—not written to be read

The reader can—and often does re read the same passage—two or three times over if he so wishes He slows down his pace of reading or speeds it up according as the passage is difficult or easy while the listening pupil can not determine the pace of the broadcast. He cannot ask the broadcaster to repeat himself

Those planning the broadcast must give a great deal of thought to sentence structure and sequence without showing up any laboured effort It should have spontaneity and lucidity of exposition Metaphors should be familiar and simple and all questions should be anticipated and answered

Form And Thought Content

In a radio programme form is as important as its thought content it may be a dialogue or a discussion or an interview or an actuality feature or a dramatised version of an incident.

Broadcasts do not necessarily gain by featurisation or dramatisation For some subjects a straight talk may be the most suitable For others it may be a dramatised version Form however has inherent or universal quality of being good or bad. Form and technique are no doubt important and do add to effect, but they cannot make up for the deficiencies of the thought content of a broadcast

A broadcast is an experience in listening Therefore the language employed should be capable of conjuring up in the minds of the listeners appropriate complementary visual experience pictures to support and amplify what is heard

A New Method

School broadcasting marks a new development in educational methods and practice It emphasises the social relevance of knowledge The conventional school curriculum is organised round a systematic array of subject-matter neatly divided and sub-divided into heads and sub-heads

The broadcast usually assumes a 'problem approach It is built round an interest or a real life situation It does not deal with knowledge theoretically or compartmentally It draws upon all areas of knowledge to create learning situations For instance a class lesson on hygiene will ordinarily give the various ways disease is communicated and will follow it up by a listing of precautions and prophylaxis while a broadcast will work round an incident from real life say, a road accident and build up a series of learning situations

Problems arise in a natural way and are tackled with the urgency of immediacy The need for stopping blood of preventing infection of keeping the sufferer warm will involve the application of the principles of first aid enabling the listener to pick up in the context of real life knowledge of hygiene and of handling accidents

The Changing Pattern

Education is passing through a period of rapid change New syllabuses are being planned new curricula and courses of study are being tried out The syllabuses give only the outline The content of the topics is determined by the text books and the *teacher* Good *text* books are rare and the teacher may not have the vision and the depth of scholarship to develop the topic School broadcasts develop the topic into a communicable experience

School Broadcast And Teacher

A broadcast to schools can achieve educational results under the guidance of a teacher who has some idea of what the broadcast is about and who is well versed in the art of utilising broadcast for educational ends. Notes for the teacher in the school broadcasts pamphlet should ordinarily give enough material for guiding listening. Of course he can draw on his own experience of handling learning situations and knowledge of the subject matter.

The class must be prepared to listen. Preparation is very important partly because class background varies from school to school and partly because a broadcast will carry more weight if its relevance is seen before. But a teacher can overshoot the mark. Too much preparation is generally as bad as too little and it would be unwise to make a programme seem flat and still when it is heard.

More advanced broadcasting organisations put out a large volume of accompanying literature. They publish folders and copiously illustrated pamphlets to support the sound broadcasts. Some of these pamphlets are actually referred to by the broadcaster in the course of his talk. He asks the listeners to open the pamphlet on a particular page. This makes listening a completer audio-visual experience.

The sound broadcast ceases to be a blind medium. For instance, if the broadcast has for its subject the story of the exploration of a certain part of the world a world map could be hung up in the class and places mentioned in the explorer's adventure could after the broadcast be located by students. The teacher could also help. He could follow up the interest thus awakened by telling them a little about the modern routes and compare them with the route followed by the explorer.

Pictures and models of sailing ships then in use could also be displayed. All this will make the broadcast a richer and fuller experience coordinating what the ear hears with what the eye sees. While supporting visual aids add to the value of a broadcast, too much reliance on them may weaken the aural side. Some of the best books of fiction are not illustrated. The author creates word pictures which live and grow in the memory. A good broadcast is one that can stand on its own feet and does not depend too much on its [illegible] with pictures.

The Role of Teacher

In listening together with the class the teacher assumes a new role. He ceases to be an oracle. He becomes a co-listener and a participant in an experience. In class room teaching critical attitude on the part of the students is hardly possible and may be a source of irritation to the teacher.

The broadcast is impersonal and the teacher and the pupils can join together to criticise it as they like. Thus listening to school broadcasts can be as much a method of improving the background of the teacher as of the pupils and can achieve what class room teaching seldom promotes, a critical attitude.

The school broadcasting implies a new method in education and, consequently, needs new training for those who are entrusted with the task of planning and producing programmes and those who utilise them at the listening end. All India Radio started, last year, a scheme to train teachers in the installation, manipulation and maintenance of radio receiving sets and the utilisation of broadcasts to schools. The impact of a broadcast is largely determined by the quality of reception which depends on the quality and condition of the receiving set.

The teacher guiding the listening must be familiar with the mechanical handling of the receiving set. The short courses organised by All India Radio have provision for practical training in the installation and manipulation of radio receiving sets by engineers of All India Radio. There is then the educational side. Good reception having been ensured, it is necessary for the teacher to know the technique in fact to develop the art of *utilising the broadcast*.

Broadcasts to schools provide a rich menu occasionally too rich. It is neither necessary nor possible for the listening class to listen to all the series or all the broadcasts in the same series. At the beginning of the school term the guiding teacher should decide as to which broadcast or group of broadcasts each class should listen to. He can make a radio diary.

The criterion for selection should be the aptness of the broadcast in relation to the interests of the class and their earlier knowledge of the subject. The training provided in these courses gives the teacher thinking points for organising listening to school broadcasts and if he is experimentally minded he will be able to evolve a technique which suits his own purposes best.

Training Of Producers

Besides training the teacher it is necessary

(Continued on page 428)

Have you ever marvelled at the power some people have of summoning up at will complete, detailed mental images of past events? By learning to exercise this ability, you can make thinking a more vivid, vital experience

OBSERVATION CAN BE DEVELOPED

By BRUCE BLIVEN

WHICH weighs more a pound of feathers or a pound of lead? Everybody knows the answer they both weigh the same An interesting point, however is what sort of image popped into your head when you read those words

One person who answered this question saw distinctly a pair of scales with a cube of lead on one scale balancing a big mound of feathers on the other A second person got no mental image but simply conceived the problem in terms of words

People differ greatly in their power to "make pictures in their heads Years ago the scientist Sir Francis Galton asked a group of colleagues to try to visualize the breakfast table as they had sat down to eat that morning Some of them saw the table in sharp detail and in colour Others saw it only in black and white Still others saw a blurred outline as if through a badly adjusted slide projector Many could get no visual image at all.

Scientists believe that most people are born with the ability to summon up in the mind s eye precise visual images of past experiences but that many of us lose this power as we grow up simply because we fail to exercise it Yet the ability can be of material value as reporter Will Irwin once proved when he was on the New York *Sun*

It was in 1906 and San Francisco was in flames Irwin who had worked on the *San Francisco Chronical* knew the city well At his desk in New York he took the fragmentary dispatches and figures—all that was coming out of San Francisco about the fire—and for eight days wrote lively and remarkably accurate accounts of what was happening 3 000 miles away

Latent Ability

In all that time he used 10 reference books or maps he was able to evoke for his readers detailed pictures of people and places in San Francisco—by recalling his own mental images of them It was commented a rival paper an unusual example of that imaginative reconstruction of an event which whether based upon his own observed facts or the reports of others every great reporter achieves at his creative best

That we all have this latent ability in some degree is demonstrated by the fact that almost everybody under hypnosis, can call up mental images of the utmost sharpness and detail In a recent case a man was killed by a hit and run driver A number of people witnessed the accident but were vague or contradictory in their accounts To clarify their evidence several of them voluntarily submitted to hypnosis and were able to provide the police with valuable details

Nearly all children have far better visual imagery than adults This explains why so many of them are natural artists until their gifts are obscured in the process of growing up Some children have remarkable powers One small boy was shown a picture of a crocodile with its mouth open a year later he was asked how many teeth the crocodile had He recalled the visual image from his memory and gave the correct number

A few adults also possess unusual visual imagery The great chess masters who can play 15 or 20 games simultaneously while blindfold have this power to the highest degree Such a player sees in his mind each board one by one with every chessman in the place where it was after the latest moves

Geniuses

Able mathematicians usually have a strong visual sense they can picture complicated mathematical problems arrayed as though on a mental blackboard Mathematical geniuses like John von Neumann could 'see the final result of an elaborate computation written out in their minds so that they had only to 'read it off'

The late Charles Evans Hughes, sometime Chief Justice of the United States had remarkable gifts I was once in the room when Mr Hughes then U S Secretary of State dictated a speech to a secretary Two hours later he delivered the same speech, without looking at a manuscript I had a copy of the speech in front of me and saw that he repeated the entire text which took about half an hour word for word

Whether you are able to visualize readily seems to have no correlation with your I Q To test your ability start with a line of

printed type (preferably rather large type) and a piece of paper. Cover up the bottom two-thirds of the line horizontally and see whether you can still read the words. If you can, your power of visualization is fairly strong.

Since nearly all of us have far greater power of imagery than we use, it would be to our advantage to cultivate them. If you are forgetful of names and faces as most of us are, look hard at the next stranger you meet with the silent promise to yourself that after he has left the room you will summon up his features in your mind—in full colour. With a little practice nearly all of us can improve. And next time you have to do a simple sum in addition or subtraction put the figures on an imaginary blackboard and try to get the answer without resorting to paper and pencil.

Rudyard Kipling in his famous novel *Kim* tells how Lurgon Sahib a member of the Indian espionage system in British India trained Kim and another small boy. He put before them a tray on which various jewels were carelessly spread out. The boys were allowed to look at the tray for only a few seconds, then it was covered and the boys recited what they had seen. The first time Kim tried this he was unable to list all the jewels but the other boy—who had had several months of training—recited them perfectly. This was Lurgan Sahib's method of teaching the boys to observe and closely remember correctly.

A remarkable story is told about General George Marshall who has said that he actually sees a printed page of figures or a scene in battle which he wishes to recall. At a Press conference in Algiers during the Second World War General Marshall began by asking each of the 60 war correspondents present, in turn what question he wished to ask. After the 60 men had put their queries to the General, he looked off into space for perhaps 30 seconds then began.

Visual Imagery

He spoke for 40 minutes giving a detailed and connected account of the war situation in which he included a complete answer to each of the 60 questions. While the correspondents were amazed at the General's brilliant and encyclopaedic mind one thing particularly astonished them: as General Marshall reached the point in his narrative which concerned a specific question he looked directly at the man who had asked it!

Few of us can attain General Marshall's brilliance, but we can develop our ability to recall the images of past experiences—to live again in memory our travels through beautiful scenery to enjoy the recollection of great paintings seen, or operas or plays attended. But beyond such practical uses of visual imagery, we are more complete persons when we restore this ability with which we were born.

Nature has a reason for everything she does; it is always a pity when we, through ignorance or carelessness destroy her handiwork.

—*From Readers Digest,*

(*Continued from page 4?6*)

to train those who produce the programmes. In December 1957 Producers and Assistant Producers and others working in the School Broadcasting units of the regional Stations met together in Delhi from December 9 to 18 to discuss the technique of planning and scripting of programmes and their studio production. The Seminar had the advantage of working under the direction of Mr John Reed, Assistant Head of School Broadcasting, B.B.C. who was invited by All India Radio to guide discussions and to give to All India Radio the experience of B.B.C. in the field of school broadcasting.

Improvement will come about only through the slow accumulation of experience over a long enough time span and by the building up of a panel of talented script writers familiar with the radio medium.

Programme Exchange

Another step of significance to broadcasts to schools is the Programme Exchange Unit. This unit is now engaged in the task of discovering broadcasts of enduring value and making them available to other Stations.

But, it must be remembered that the quality of programmes will ultimately depend upon helpful and suggestive criticism. It is a pity that criticism so far has swung between condemnation and lavish praise and does not give the organisation constructive ideas for improving the quality and content of the programmes.

Schools must play their part by offering specific criticism. Teacher training colleges can help A.I.R. and themselves by making listening to broadcasts to schools a project of class work in teacher's education.

THE GUIDED MISSILES

By M R, BRIGGS, P CASTRUCCIO And L ATRAN

FROM the primitive spear to the arrow and later to the gun the trend of history has been towards faster and further reaching missiles with greater lethality upon impact The basic difficulty with all these devices was (and in some cases still is) the operator s lack of control over the projectile once it left the launching engine

Target motion during the missile flight, wind effects, deflections caused by air turbu lence, and in the case of long range projectiles varying densities of air strata all contribute to inaccuracy of aim The advent of anti aircraft guns for shooting at fast targets in tensified these problems and called for more elaborate schemes to anticipate target motion, and aim the projectile on an accurate inter ception course

Even with many advancements the aim of an ordinary anti aircraft gun or even field or naval guns is far from perfect The obvious need was a device that could be controlled during flight, and its course corrected to account for the various disurbing factors—a guided missile.

The guided missile is basically a projectile which includes a destructive warhead and devices for propelling it, guiding it to the target (and keeping it flying straight The guidded missile also must contain power sources for its various auxiliary services and in some cases transmitters to enable its con troller to locate the missile during flight

Guided missile development had to await development of several basic components first of all the motor then the aerodynamic knowledge to properly design the airframe, and then a means for guidance

Guidance

Guided missiles today range in size from a few hundred pounds to ten tons or more Some employ simple guidance systems others are very elaborate and require huge guidance installations Modern missiles can be classi fied in several basic categories which include (1) surface to surface (2) surface-to-air, (3) air to-surface (4) air to- air and (5) special applications (air to-underwater surface to-underwater underwater to-air underwater to-surface)

A primary technical problem in guided missile design is the guidance system, without which the missile is little more than a cannon shell Several basic guidance schemes are in existence

Guidance by wires This system is used today in simple anti tank missiles particularly in a French version The system was also employed by the Germans during World War II in one of their air to-air missiles but is now practically abandoned because of the obvious difficulty of stretching a wire between the ground or the aircraft and the missile In the French version of anti tank missile the operator fires the missile while keeping the target within the sights of the tele scope The operator keeps the missile centered on crosshairs by manipulating a control box that transmits appropriate signals to the missile control surface

Command Guidance This guidance method uses coded signals from the launcher Generally the method performs as follows a ground radar tracks the target and knows its bearing and range the missile is fired and guided by appropriate signals from the ground towards the target The system is similar to wire guidance with the wire replaced by a radio link

Signals

A related method used in the Matador missile provides continuous electronic signals that blanket the area between the missile launcher and the target The missile is pre-set to fly in a certain path and derives its in formation from these radio signals This sys tem has the disadvantage that radio waves especially over long distance become easily distorted so that guidance information becomes decreasingly accurate as distance increases be tween the missile and launching station

Beamrider In this system a radar tracks the target continuously and keeps locked on it The missile is launched in the radar beam and follows the beam until it hits the target.

To achieve accuracy the beam from the radar must be narrow At the same time the missile must be launched from a place some-what removed from the radar to prevent bur ning the radar with exhaust flames Therefore the missile must be aimed to intercept the radar beam (be captured by the beam) With a

Therefore most systems use two beams—a narrow beam ensures accurate guidance and a broader beam centred with the narrow beam insures capture. The missile is launched towards the beam without requiring excessive accuracy and is first captured by the broad beam, which then pulls the missile to the centre of the narrow beam.

The system is relatively simple and economical and requires relatively little complication within the missile or on the ground. But it has the drawback that the missile towards the end of its flight is forced into lateral accelerations unless the target is flying directly towards or away from the radar. The system is also somewhat inefficient in utilisation of the ground equipment.

"Homing" types of guidance: These are the most modern types and require a greater degree of intelligence in the missile than do the other systems. Homing type guidance systems are either active or passive. In the passive system a radar illuminates the target and reflections from the target are "seen" by the missile. In the active type the missile is equipped with its own radar which illuminates the target and the missile zeros in on the return signal.

Trajectories

A Homing missile can follow several types of trajectories. Pure Pursuit, in which the missile constantly aims at the target. This system requires longer flight paths than other more modern systems. It was used in early German missiles but is now almost entirely *obsolete*.

Proportional navigation, in which the missile is automatically aimed to achieve a collision course with the target. This is the most modern system and is widely used. Other guidance systems are deflated pursuit and the constant courses.

Inertial guidance: Some drawbacks exist with the guidance systems previously discussed primarily because guidance occurs by means of radio signals which can be detected by the enemy to reveal valuable information on attacker position. In addition the enemy can use his own *signals to a [illegible] to jam or* seize control of the missile.

The other principal drawback is that electronic guidance by radar only works within line-of-sight, as soon as the distance becomes so great that the earth's curvature is involved, radar signals cannot follow the missile. To [illegible] surface-to-surface missiles the inertial guidance system is used. This system is based on the use of gyros spinning masses that maintain their attitude in space regardless of missile motion.

By comparing the direction of the force of gravity with the preset gyro direction, the missile can tell when it has reached the target. In theory the system is fool proof, but it requires extremely accurate gyros which are very delicate instruments. Furthermore accurate knowledge of the direction of the force of gravity is difficult to obtain in a moving missile. Considerable effort is currently being expended by various agencies and companies to correct these drawbacks.

Guidance by stars: This type of guidance is similar to that used by ships. This missile is equipped with special instruments that observe certain star positions and compare these positions with force-of gravity direction. When the right position is reached the missile automatically dives to bomb the target. Again, the major difficulty is accurate knowledge of the direction of the force of gravity.

Combination guidance: A missile weapon system may involve combinations of the above types of guidance. For example, one ground-to-air missile system uses command guidance during the mid course phase until the missile is in a position to acquire the target with its own active homing system for terminal guidance. Another guided missile system uses a modified beamrider and passive homing guidance combination.

Components

The following principal components are needed for a successful missile:

Motors: Numerous types of motors are used for guided missiles ranging from jets to rockets. Use of any motor depends upon the application. Solid or liquid fuels are used for propelled rockets, pulse jets for subsonic missiles and ram jets for supersonic missiles. Some missiles employ a combination of rocket boosters to bring the missile to supersonic speed after which a ram jet takes over.

Warheads: The business load of the missile ranges from a few tens of pounds to hundreds of pounds. Generally speaking the efficiency of a missile in terms of warhead weight carried for a given missile weight is low. A typical medium range missile carrying a hundred pound warhead may weigh as much as 5,000 pounds. Warheads perform their [illegible]

blast or by other devices now under study In the future, most warheads will probably be of the nuclear type.

Autopilot This mechanism is required to keep the guided missile flying straight, in the same manner that a pilot (or auto-pilot) is required for aircraft In fact while an air craft should be able to fly all by itself after the course is set, any small disturbances (winds changes in balance, and so forth), would soon deviate the aircraft from its proper course unless they are properly corrected The heart of the autopilot is the gyro Appropriate equipment senses differences in aircraft atti tude with respect to the gyro and commands rudders or control surfaces to correct the dis crepancy

Radar

A typical example of present missile development is the Bomarc, a U.S Air Force surface to-air guided missile capable of destroy ing high flying enemy bombers at considerable range The ground guidance equipment uses ground based radar data to guide the missile to a position from which the missile guidance unit can find the attacker and then navigate to a collision path

The ground guidance system for the Bomarc is designed to realise maximum effectiveness from the entire weapon system It provides a broad area defence so that many cities can be defended by each network of ground guid ance system and missile bases

Studies are being made to optimise the weapon system performance against targets that try to avoid Bomarc attack by flying 'evasive' courses Also techniques are being developed to minimise the effectiveness of enemy attempts to confuse the weapon systems by electronically 'blinding ground and missile radars or jamming the radio command link

An indication of the advanced thinking applied to the growing missile field can be gleaned from the quality and number of studies performed in recent months Consi derable time and effort have been expanded *on bomber defence*, one of the most intrigu ing of current-day air warfare problems

The bomber in its attempt to reach the target must defend itself against a wide variety of enemy countermeasures, which include interceptor aircraft and missiles of the Bomarc type Defensive action, originating in the bomber s central data computer, or ' brain , must select the weapon that will most effectively thwart the enemy This may entail transmitting radar signals destined to jam enemy tracking devices it may necessitate using false targets as a confusion aid or as a last resort launching a defensive missile

The U S Air Force has asked for a bomber-defence missile system for the projected nuclear bomber The U S Navy interest in a defensive system for its heavy aircraf initi ated another study that advocates a rather unconventional missile form for aircraft protection against rear attacks

Research

Both projects required intensive research into basic concepts of air warfare to achieve a system of the future capable of fulfilling its tactical requirements but which is at once producible reliable and of low cost to the U S Armed Forces

Weapons system development has resulted in the extension of fire-control systems formerly restricted to guns and rockets to include missile capabilities All weather interceptors flying against enemy aircraft can now unleash long range highly accurate air to-air guided missiles at safe distances

Tie in of the fire control brain to an automatic flight control system (an advanced type 'autopilot) has been accomplished to provide both stabilisation and guidance of the aircraft while tracking the target—all with out pilot aid.

The challenge of space flight has initiated many fundamental studies including those directed towards improving inertial navigation systems, which are destined to answer the many problems of precision long range navi gation. A missile navigation sysetm that is invulnerable to enemy jamming insensitive to weather and completely independent of ground aids for navigation is ultimate for long range flight both over the earth s surface and in outer space Out of these continuing studies will come solutions that will enable man to guide missiles, not merely as weapons of war but as vehicles of peaceful transport, to their solar destinations

THE "PEOPLE'S SECTOR"

By SHRIMAN NARAYAN

UNVEILING the statue of Jamsetji Tata in commemoration of the Golden Jubilee of the Indian steel industry, the Prime Minister deplored the talk of differences between the public and private sectors in industry. Nehru refused to believe that there was much difference between the public and private sectors and stated: "It was ultimately the people sector which meant the well being of the people and the country, that counted."

He further stated that in the fast-changing world many things and ideas had undergone revolutionary transformation. "Today it was not the capital alone but also the intelligence and labour that counted among the productive potentialities." The Prime Minister deprecated any class conflict as well as any controversy over respective intrests. He stated that "all would have to work for the ultimate good of the people."

We warmly welcome these remarks of the Prime Minister in regard to the basic idea underlying our economic and industrial development. The frequent but wholly unnecessary controversy between the public and the private sectors tends to divert the attention of the people to subsidiary matters and creates a sense of bitterness which does good to nobody.

It has been very clearly stated in the Second Five-Year Plan that "the developments in the public sector have to be viewed together with those envisaged in the private sector. The two sectors have to function in unison and are to be viewed as part of a single mechanism. The Plan as a whole can go through only on the basis of simultaneity and balanced development in the two sectors."

State's Powers

The State possesses ample powers to influence and control and regulate the development of the private sector especially when our financial resources are meagre and limited.

It is much better to utilise the available resources for establishing new industries more especially basic enterprises rather than to fritter away the limited funds on purchasing old and out-of-date establishments which are being run by the private industrialists.

The Industrial Policy Resolution of [illegible] has clearly demarcated the fields for the [illegible] and private sectors. It states specifically [illegible] in an emergency Government has the power to take over any industry [illegible] for national defence. But it is hardly [illegible]sary for the State to run those [illegible] which are not of a basic or "key" type.

A large part of the private sector [illegible] India consists of small producers and [illegible] scattered all over the country. It [illegible] be unwise for the State to try to curb [illegible] initiative and resourcefulness of these producers and artisans by extending [illegible] administrative control over them. The policy would be to encourage them to org[illegible]nise themselves into Industrial Co-opera[illegible]tives.

The Government of India and the St[illegible] Governments have been following this pol[illegible] under the Second Five Year Plan. It [illegible] Co-operative Sector which should be expand[illegible]ed and encouraged to the maximum in the country. It combines and harmonises the advantages of both the private and public sectors and quickens the pace towards the establishment of a really Socialist Pattern of Society. The workers themselves become the owners of the instruments of production. The whole problem of conflict and strife between labour and capital tends to vanish and melt away.

Encouraging

We do not see any reason why the Co-operative Sector could not gradually be extended to the medium scale and large scale industries as well. The recent experience of the Co-operative Sugar Mills established in the Bombay State has been quite encouraging. In the Western countries also, particularly in the United Kingdom, there are large scale establishments organised on a co-operative basis.

There is the pattern of industrial organisation which the State should try to encourage and sponsor in a country like India which is determined to establish a Socialist Society through peaceful and democratic means.

The Prime Minister's remark about the ultimate importance of the well-being of the people in a planned society should make both

the private and the public sector think seriously about their present state of affairs

Indian industrialists in the private sector always clamour for more and more concessions from the Government in order to be able to earn greater profits Unfortunately their idea of reasonable profit is quite different from that of the industrialists of other countries No modern State can allow private industrialists to earn profits at the cost of the consumer beyond a reasonable limit It is therefore, desirable that the Indian Industrialists now reconcile themselves to the idea of limited profits under a planned economy They should also feel confident that the Government has no desire to liquidate or stultify the private sector in its scheme of economic development

We are unable to understand the nervous attitude of some of the industrialists in regard to the economic policy of the Government of India specially when it has been made abundantly clear repeatedly that the Government has allotted a specific place to the private sector in national planning This, of course presupposes that the private sector would behave and function in the interest of the people of India and that private interests would be harmonized with public interest

In the public sector also there is much room for improvement from the point of view of the well being of the people The recent Chagla Commission Inquiry Report has helped to bring out several important points about the organisation of the public sector which need very serious consideration

The old myth of the miraculous capacity of the Indian Civil Service personnel to manage and administer any type of the public activity stands exploded It is absolutely essential to train proper personnel for specific public utility enterprises in a thorough and systematic manner

We welcome in this connection the decision of the Government of India to institute an Indian Economic Service for manning State enterprises Though belated this is a step in the right direction. It is also desirable not to transfer these trained persons from one industry to another too frequently Such frequent transfers, as in the Secretariat do not create any sense of responsibility and sustained effort for making a public enterprise a success

Let us also try to understand the contents of the ' well being of the people which the Prime Minister terms as the ' people s sector The first factor constituting the well being of the millions of our people is, of course, improvement in their standard of life

The Moral Side

As Gandhiji repeatedly stressed, there is no essential difference between a higher standard of living and a better standard of life While trying to ameliorate the economic condition of our people we should not lose sight of the fact that man does not live by bread alone Merely trying to provide better housing better food better clothing and a number of comforts and luxuries, does not constitute real increase in the standard of life in society

The need to raise the moral and cultural standards of the masses should always be kept in the forefront while planning for the nation As the Prime Minister himself has often stated the greatness of a nation is known not by the high buildings huge factories and big armies but by the quality of men and women who inhabit the country.

The second factor which essentially constitutes the well being of the people is the provision for full employment and the right to work. It is this aspect of employment which must be the over riding consideration in our scheme of planning whether in the private or in the public sector Since the public sector consists mainly of basic or key industries and enterprises there is not much scope for greater employment But the private sector has to shoulder greater responsibility in this matter

No one can afford to under rate the value of technological improvements But the human factor could never be ignored in economic planning in India or for that matter, in any country After all economic planning is for the good of the people, the basic interest of the people cannot be subservient to the techniques of planning

GEMS OF THOUGHT

Do it now It is not safe to leave a generous feeling to the cooling influences of a cold world

—*Thomas Guthrie*

* * *

If I have learned anything it is that pity is more intelligent than hatred that mercy is better even than justice that if one walks around the world with friendly eyes one makes good friends.

—*Philip Gibbs*

THE SUDAN

THE Sudan an immense country of infinite variety has reached a turning point in its history For the first time the Sudanese have freely elected an all Sudanese Parliament under a completely independent Sudanese Republican regime

The first all Sudanese Parliament and Government were formed in 1954, after Britain and Egypt had agreed to grant the Sudan independence But it was not until January 1 1956 that the country actually became independent

Now the Sudanese are their own masters —and they face problems as immense and as varied as their country

One of the first tasks of Parliament will be to draw up a permanent Constitution Since 1956, the country has had an interim constitution which declared the Sudan a Sovereign Democratic Republic It declared the citizens right to Freedom Equality and Property and the Judiciary an independent department of state free from interference or control by any organ of the government executive and legislative

The new Constitution on which a committee has been working for some months now, will be based on the interim Constitution

Largest Country

Once the Constitution is approved Parliament which is elected for a term of three years will begin to tackle other problems

With an area of 976,750 square miles, the Sudan is the largest country in Africa Its population of just under 10,500 000 is composed of widely differing races ranging from the nomadic Moslem Arabs in the north to the largely pagan bush tribes with their tom-toms witch-doctors African drums and deep-rooted dislike of clothing in the south

The young Republic needs more water for irrigation especially in the north-west It needs better communications, more hospitals schools houses and industries and increased foreign trade Above all it needs capital Sudanese and foreign.

The two main cities Khartoum the capital with 93 000 inhabitants and Omdurman just to the north with 113 000 inhabitants are ultra modern compared with practically every other town in the country But they have no concrete pavements the roads when they are paved are unsatisfactory the street lighting where it exists is hopelessly inadequate public transport consists of a slow tram between Khartoum and Omdurman and a fleet of gaily painted buses plying between the towns and nearby villages and apparently held together with bits of wire

For eight tenths of the year heat of between 90 and 116 degrees (Fahrenheit) in the shade oppresses the two towns. The slightest breeze from the Nile sends dust billowing through the roads and into the one or at most two-storey flat roofed houses

Busy Tailors

Under the porticos of buildings in the market areas tailors work busily veiled women enveloped to their eyes doze behind strange wares spread in the dust before them cross legged men wait for customers for their neatly laid out rows of sandals slippers or framed photographs of politicians

Lean Arabs jostle with tall, pitch black Nubians and immigrants from the South in the market places, sleek gleaming American limousines wait patiently while a donkey or an occasional camel ambles across the street

The Sudan is primarily an agricultural country Its main product is cotton and a narrow triangle between the White and Blue Nile, south of Khartoum known as the Gezira which is the principal cotton area yields four fifths of the country's total wealth

Other exports are camels cattle hides and a certain amount of citrus fruits

Attempts are being made to increase agricultural output by bringing water through Nile dams canals and pumping schemes to areas previously barren. The aim is to expand the cotton belt and produce more rice coffee, tobacco citrus fruits, dates and mangoes

The first tentative steps are also being taken towards a certain amount of industrialisation. Factories are being opened to process cotton and agricultural produce and make basic necessities such as cloth oil, soap and sugar

Large areas of the country are without train services The present railway network consists of only three lines from Wadi Halfa (on the Sudanese Egyptian border) to Kosti through Khartoum from Atbara (railway

between Wadi Halfa and Khartoum) to Port Sudan (the country s one large port) and from Sudan south west to Kassala and Babanusa

The only communications between the capital and Juba the largest Southern town are by air and a river steamer which takes 16 days for the journey

Illiteracy

Another major problem for the Sudan is illiteracy Nearly 95 per cent of the population is completely illiterate A large percentage of the inhabitants of the swamplands and bush of the southern provinces could not even understand the simple pictorial symbols used in the recent general election for the benefit of those who could not read

The Government has promised to open more schools but it is authoritatively estimated that at least a hundred years are needed before even every male in the country is taught to read and write

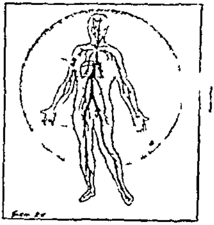
New hospitals are urgently needed before any thorough attempts can be made to fight the epidemics of enteric fever smallpox yellow fever malaria and sleeping sickness which periodically sweep across huge areas of the west, east and south The average expectancy of life in many parts of the country is about 28 years and specialists in tropical diseases say that nothing can be done to length n the lives of inhabitants in these areas without modern hospitals

Another major concern of the Khartoum Government in the near future will be to win the confidence of the negroid primitive southern tribes

These peoples with their babel of different languages have been traditionally suspicious of the very remote central Government And their fear of the Northerners goes back to the days when Arab slave-dealers used to make slave collecting expeditions to the southern bush country

The long standing unrest in the South flared up into riots between Southerners and Northerners in the Southern provinces in the summer of 1955 The graves of the 500 people who were murdered on both sides are still a prominent feature of the southern scenery

Wryly summing up a Government official in Khartoum said recently ' We are probably one of the few countries in the world which won complete independence from foreign rule without bloodshed—but certainly our immediate future is no bed of roses



DID YOU KNOW ?

The human being experiences 47 different kinds of headache

The Communists have officially declared tea a cunning device to exploit workers describing how a British factory owner provides workers with tea and music during morning and afternoon rest periods to whip up their nerves ! They cited this as an example of how capitalists will use any means to get the utmost out of their workers

The human heart stops for one-sixth of a second between beats As a result your heart stands still for a period equal to one-sixth of your lifetime

THE SUDAN

THE Sudan an immense country of infinite variety has reached a turning point in its history For the first time, the Sudanese have freely elected an all Sudanese Parliament under a completely independent Sudanese Republican regime

The first all Sudanese Parliament and Government were formed in 1954, after Britain and Egypt had agreed to grant the Sudan independence But it was not until January 1 1956 that the country actually became independent

Now the Sudanese are their own masters —and they face problems as immense and as varied as their country

One of the first tasks of Parliament will be to draw up a permanent Constitution Since 1956, the country has had an interim constitution which declared the Sudan a Sovereign Democratic Republic It declared the citizens' right to Freedom Equality and Property and the Judiciary an independent department of state free from interference or control by any organ of the government, executive and legislative

The new Constitution, on which a committee has been working for some months now will be based on the interim Constitution

Largest Country

Once the Constitution is approved Parliament which is elected for a term of three years will begin to tackle other problems

With an area of 976 750 square miles the Sudan is the largest country in Africa Its population of just under 10 500 000 is composed of widely differing races ranging from the nomadic Moslem Arabs in the north to the largely pagan bush tribes with their stone axes witch-doctors, African drums and deep-rooted dislike of clothing in the south

The young Republic needs more water for irrigation especially in the north west It needs better communications more hospitals schools houses and industries and increased foreign trade Above all it needs capital Sudanese and foreign

The two main cities Khartoum the capital with 93 000 inhabitants and Omdurman just to the north, with 113 000 inhabitants are ultra modern compared with practically every other town in the country But they have no concrete pavements the roads when they are paved are unsatisfactory the lighting where it exists is hoplessly [illegible] quate public transport consists of a slow [illegible] between Khartoum and Omdurman and [illegible] fleet of gaily painted buses plying between the towns and nearby villages 'and apparent[illegible] held together with bits of wire

For eight tenths of the year heat of between 90 and 116 degrees (Fahrenheit) in shade oppresses the two towns The slightest breeze from the Nile sends dust billow[illegible] through the roads and into the one or at mo[illegible] two-storey flat roofed houses

Busy Tailors

Under the porticos of buildings in the market areas tailors work busily women enveloped to their eyes doze behind strange wares spread in the dust before them cross legged men wait for customers for their neatly laid out rows of sandals slippers, or framed photographs of politicians

Lean Arabs jostle with tall pitch black Nubians and immigrants from the South in the market places sleek gleaming American limousines wait patiently while a donkey or an occasional camel ambles across the street

The Sudan is primarily an agricultural country Its main product is cotton and a narrow trianlge between the White and Blue Nile south of Khartoum known as the Gezira which is the principal cotton area yields four fifths of the country's total wealth

Other exports are camels, cattle hides and a certain amount of citrus fruits

Attempts are being made to increase agricultural output by bringing water through Nile dams canals and pumping schemes to areas previously barren The aim is to expand the cotton belt and produce more rice, coffee, tobacco citrus fruits, dates and mangoes

The first tentative steps are also being taken towards a certain amount of industrialisation Factories are being opened to process cotton and agricultural produce and make basic necessities such as cloth oil soap and sugar

Enormous areas of the country are without train services The present railway network consists of only three lines from Wadi Halfa (on the Sudanese Egyptian border) to Roseires through Khartoum, from Atbara (midway

between Wadi Halfa and Khartoum) to Port Sudan (the country's one large port) and from Sudan south west to Kassala and Babanusa

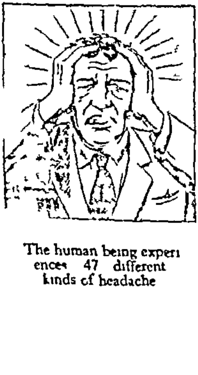
The only communications between the capital and Juba the largest Southern town are by air and a river steamer which takes 16 days for the journey

Illiteracy

Another major problem for the Sudan is illiteracy Nearly 95 per cent of the population is completely illiterate A large percentage of the inhabitants of the swamplands and bush of the southern provinces could not even understand the simple pictorial symbols used in the recent general election for the benefit of those who could not read

The Government has promised to open more schools but it is authoritatively estimated that at least a hundred years are needed before even every male in the country is taught to read and write

New hospitals are urgently needed before any thorough attempts can be made to fight the epidemics of enteric fever smallpox yellow fever malaria and sleeping sickness which periodically sweep across huge areas of the west east and south The average expectancy of life in many parts of the country is about 28 years and specialists in tropical diseases say that nothing can be done to length n the lives of inhabitants in these areas without modern hospitals

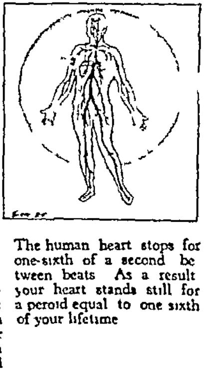


Another major concern of the Khartoum Government in the near future will be to win the confidence of the negroid, primitive southern tribes

These peoples with their babel of different languages, have been traditionally suspicious of the very remote central Government And their fear of the Northerners goes back to the days when Arab slave dealers used to make slave collecting expeditions to the southern bush country

The long standing unrest in the South flared up into riots between Southerners and Northerners in the Southern provinces in the summer of 1955 The graves of the 500 people who were murdered on both sides are still a prominent feature of the southern scenery

Wryly summing up a Government official in Khartoum said recently ' We are probably one of the few countries in the world which won complete independence from foreign rule without bloodshed—but certainly our immediate future is no bed of roses



DID YOU KNOW ?

The human being experiences 47 different kinds of headache

The Communists have officially declared tea a cunning device to exploit workers describing how a British factory owner provides workers with tea and music during morning and afternoon rest periods to whip up their nerves ! They cited this as an example of how capitalists will use any means to get the utmost out of their workers.

The human heart stops for one-sixth of a second between beats As a result your heart stands still for a period equal to one sixth of your lifetime

PEOPLE WANT TO KNOW

By GERALD WENDT

(Last month we published some questions in the field of Natural Sciences with their answers These questions were of general interest and very much liked by our readers. This month again we are publishing below some more questions with answers by courtesy of the Editor, Unesco Featurs—*Ed. C & C)*

Q *Mr Mochtar Lubis Editor of* ' Indonesia Raya *in Djakarta asks "Can plants be acclimatized as men and animals can? For instance can tropical plants be gradually adapted for growth in cold climates?*

Ans. Man is the only animal truly adaptable to any climate but that is only because he has the intelligence to protect himself from extremes by building houses wearing suitable clothes lighting fires for warmth using fans for cooling and changing his diet Many animals can also make moderate adjustments to a change of climate especially those species that make homes by burrowing underground to protect thems lves from either the heat of the sun or the cold of winter But those animals that are best adapted to extreme or particular conditions do not survive under adverse conditions Those that have heavy fur to protect themselves from the cold—such as polar bears—cannot endure hot weather because they have no way of keeping themselves cool Others with bare skins—like the elephant and the hippopotamus—can keep cool under tropic conditions but are unable to stay warm in snow and ice Most animals are also equipped for hunting and eating a certain kind of food such as fish or underwater plants or rabbits or snakes and starve when they cannot find them—unless they are fed by man But in the course of many thousands of years animals have wandered over the face of the earth and have often adapted themselves to a different environment by natural selection over many generations Thus different species of some animal families like cats dogs deer mice and even camels can live under climatic conditions that are very different from those of other species of the same family

Plants are in general much less adaptable. They are well fitted for certain conditions of moisture of temperature and of sunshine but will seldom survive a change, or if they do survive they will not bloom or produce seeds and so die out. Juicy thin-skinned water plants and swamp plants soon die if they are deprived of water On the other hand the hard shelled cactus and other desert plants are unable to cope with much water The broad-leaved plants are fitted for life in the shade of trees and seldom do well in direct sunlight. But narrow thin leaved plants like the different grasses are fitted to grow in direct sunshine and will not survive under trees or in the forest, because they do not get enough sun All leaves are killed by frost, that is by a temperature of less than 32° Fehrenheit. In cold climates a plant must either have oily needles instead of leaves—like the pines and spruces — or it must shed its leaves and concentrate its sap underground during the winter as most plants of the temperate zones do One other device of many temperate zone plants is to produce hard dry seeds which survive the cold while the mother plant dies, so that a new generation appears each year Since tropical plants cannot do any of these three things they never survive a frost.

However, tropical plants can live outside the tropics if the temperature does not reach freezing point But if they do they grow much more slowly do not attain their normal size and either produce no flowers or their flowers produce no seeds The lowered tempeature and especially the short warm season do not allow them time enough to develop But equally important is the presence of insects to fertilize the flowers Many are dependent on certain special varieties of insects to carry the pollen from one flower to another and when they are removed from their natural environment the necessary insects are usually absent and no seeds are formed Nevertheless, without flowers, tropical plants can survive in dwarfed form in cooler climates but not in cold ones

Q *Dr Astiages P Macias Munoz of Babahoyo Ecuador asks 'Is it true as I have heard on the radio that the moon is about to breake up? If so, what is the reason for its loss of cohesion? And if it does, what will become of its fragments? Will they fall disastrously to earth or will they remain suspended where they are?*

Ans There is no reason whatever—either in theory or in factual evidence—to suppose that the moon will—or even can—split or shatter It would require colossal energy to break the cohesion of the solid rock of which the moon is made and no source of such energy is known or suspected with the very improbable exception of a collision with another heavenly body However if the moon did split under internal forces the fragments would still have their present kinetic energy and therefore would have to continue in the present orbit of the moon around the earth as if nothing had happened In the almost impossible event of a collision the fate of the fragments would depend on the mass speed and energy of the colliding body

Q *Mrs Ann Firth of Bletchley, England, asks "How fast can a mosquito bite?"*

Ans A hungry mosquito can plunge its proboscis into its victim as soon as it alights—within a second A swarm of mosquitoes can attack at alarming speed Professor A W Brown of the University of Western Ontario has reported that in the heavily mosquito-infested areas of northern Canada an exposed forearm may receive as many as 280 mosquito bites within a minute At this rate a naked man could theoretically be drained of all his blood in less than two hours of exposure In such regions, all parts of the body including face and hands should be kept covered.

Q. *Mr Jean Rousseau, of Paris, writes 'Is it true that antibiotics gradually become less effective against bacteria and some insecticides become less effective against insects?*

Ans Yes, any *one* antibiotic or insecticide can lose its effectiveness against any *one* colony of bacteria or of insects respectively This is because in the case of both bacteria and insects many thousands or even millions of individual bacteria and insects are exposed to the drug or the chemical Most of them are killed but some of them do not get enough to kill them The few that are able to survive learn to live with the drug or the chemical and when they reproduce the next generation is so accustomed to the drug that it can withstand a large amount of it So they are harder to kill and their resistance to the drug or chemical makes them immune For this reason, it is usually wise to use enough of the drug or chemical to kill all the bacteria or insects in a colony Those that have become immune to one antibiotic or insecticide, however are not immune to another For this reason a second treatment is often given with a different kind in order to kill those that escaped the original treatment or became immune to it A large number of both antibiotics and of insecticides is now available for this purpose

Q *Mr J Caro, of Parede Portugal, writes 'Why do we stand upright, on two feet?'*

Ans The erect posture of man is probably the consequence of the evolutionary development of the thumb When our remote ancestors learned to use the 'big toe of their front feet to pick up objects and that toe acquired a position opposite to the other toes instead of parallel with them the front feet became hands The hands proved so valuable—as can be seen in apes—that forelegs were used more as arms to extend the hands than they were for supporting the body The erect posture then developed from depending on the rear legs alone for walking and running A further and later consequence was the development of the skull and brain made possible by the erect posture Thus the thumb can be considered the beginning of man s intelligence

Q *Mr George Muirhead of Kingston Ontario Canada asks What causes the aurora borealis?*

Ans Both the aurora borealis and the aurora australis the Northern lights and the Southern Lights are probably caused by the collision of electrons and other particles streaming from the sun with atoms of oxygen nitrogen and other gases high in the earth s outer atmosphere Such particles are electrically charged and the magnetic field of the earth therefore deflects them so that they concentrate at the poles where they strike downward at very high speed When they pass through the thin air 50 to 100 miles from the surface of the earth they excite luminosity in the gases of the atmosphere in exactly the same way that neon mercury and other gases are made lumious by an electrical discharge in the glass tubes that are used in many modern advertising signs Brilliant auroral displays usually accompany or soon follow the visible spots on the sun that are actually colossal electrical storms and erupt vast numbers of electrified particles into space some of which strike the earth.

Q *Madame Gerard Vuillard of Saint Amarin France asks What is the origin of warm springs or hot springs and why are there so many of them in the French Pyrenees?*

Ans The water like the water of any spring, originates in rain which trickles through porous

1941 The duty, was at the rate of 10% *ad valorem*. From 1941 to 1948 the duty remained at 15% *ad valorem* From 1949 a higher rate of 30% was fixed on motor tyres The rates of Central Excise Duty on tyre as in operation on December 31st 1956 are

(a) Tyres for Motor Vehicles —30% *ad valorem*

(b) All other tyres 15% *ad valorem*.

The Finance Act of November 30, 1956 imposed Duty of Rs 3 000/ on the more expensive types of motor cars It also provid ed for an increased duty on motorcycles and scooters

4 **State Taxes** (a) *Motor Vehicles Tax* The basis of taxation and the rates of tax differ from state to state. The data hereunder relate to 1952 '53

Select Vehicle	*Madras* Rs	*Bombay* Rs	*Assam* Rs
1 Medium car if used			
(a) as Taxi	300	272	80
(b) for private purpose	157	120	80
2 Passenger Buses			
(a) 30 Seater	3000	1072	375
(b) 40 Seater	4800	1392	625

(b) *Sales Tax* —Sales Tax on motor spirit was first introduced in 1937 It was first im posed by Central Provinces and Berar Madras Bengal and Bombay soon followed suit Most states have separate Acts for levy of sales tax on motor spirit Rates vary from state to state The data hereunder relate to 1952 53

States	*Rate of Levy*
Punjab Uttar Pradesh Bihar Bombay West Bengal Mysore Madras and Orissa	As 8/ per gallon
	As /6/ per gallon
Travancore Cochin	As /2/ per rupee at first point and three pies per rupee at subsequent point ?
Delhi	Six pies per gallon

Some other important items of state taxes are

1 Permit charge and inspection fees levied on transport vehicles and buses
2 Driving Licence Fees
3 Other Miscellaneous Fees
4 Sales Tax on motor vehicles spare part and other items
5 Taxes on goods and passengers carried by road.
6 Tolls
7 Pilgrim and other taxes

The basis of assessments and the rates of tax vary from state to state

5 **Local Taxes** —Local taxes consist of:

1 Local Taxes including Municipal Vehicles Tax.
2 Wheel Tax
3 Tolls and Octroi duties
4 Rent for Bus Stands
5 Other taxes or charges to be specified.

The basis of assessment and the rates of tax differ from one locality to the other

6 **Comparison of average tax per vehicle in various countries**

Motor transport in India is subjected to the highest taxes in the world An analysis of the average tax per vehicle in the various countries will clearly reveal this

Country	*Year*	*Taxation per Vehicles*
Great Britain	1948-49	Rs 417
France	1947	,, 377
Union of South Africa	1947	, 289
U S A.	1948	,, 398
India	1947 49	,, 1232

III

The effects of these high rates of taxes on the production of motor vehicles may now be examined Exceedingly high rates of Central Excise on Motor Vehicles manufactured indigenously dampen the incentive of the producer *to invest money and expand production In* addition to this the indigenous producer has to pay high import duties on motor parts imported from abroad Thus the production of automobiles in India now confronts a very critical situation owing to the want of sufficient understanding of its problems on the part of the Government. The high rate of duty imposed on motor vehicles imported from abroad registertrs itself in the form of high prices without in any way enouraging Indian production The ultimate outcome therefore, of the defective policy adopted by the Government is failure to ease the difficulty as regards motor transport which our nation is facing today

The facilities of motor transport in India available at present are strikingly inadequate The number of existing motor vehicles is too insufficient to meet the ever expanding travel

requirements of the people There are only two methods of increasing the number of motor vehicles (*a*) to increase indigenous production by providing incentives in the form of lower Central Excise duty on motor vehicles and lower import duty on motor parts not available in India or (*b*) to relax the import policy with respect to motor vehicles and encourage their imports The necessity to develop the automobile industry of India coupled with the acute foreign exchange difficulties makes the adoption of the former method the only acceptable course in the present context

A thorough overhauling of the policy now pursued by the Government is inevitable to develop the industry The whole approach of the Government with respect to the policy of taxation on road transport has to be considered anew Days are gone when a car was looked upon as a luxury in India The dynamic changes in India s social set up and the consequent shifts in emphasis on the social values ought to be reflected in our economic policies also Any economic policy which fails to take notice of these changes has to be remoulded

In this connection we may offer some suggestions regarding the changes to be effected in the existing pattern of taxation

1. A substantial reduction in the markedly high rates of Central Excise Duties
2. There is a strong case to bring about uniformity in the rates of state and local taxes
3. The Sales Tax on motor vehicles motor parts tyres and tubes, fuel and lubricants etc should be consolidated into a single duty by the Centre at source
4. The fixation of a ceiling on all taxes imposed by the states on motor vehicles will be very beneficial In this respect the Conference of State Transport Commissioners/Controllers held at Mussoorie recommended the fixation of a ceiling of 75 per cent of the total taxes prevailing in Madras State in the case of motor vehicle taxation

The Central and State Governments should take effective measures as early as possible to implement the above suggestions For the growth and development of our infant automobile industry depend to a remarkable extent on the removal of the unduly high incidence of taxation imposed on it.

statistical data on the pattern of taxation in Indian road transport However every possible effort has been made to incorporate the latest available data in the article.)

ROLE OF ANTHROPOLOGY IN INDIA

In India where the tribal people form a significant part of the population Anthropology has to play an important part in framing a proper policy of tribal rehabilitation

The Department of Anthropology in the Union Ministry of Education works through eight research sections (i) Social Anthropology (ii) Social Psychology (iii) Ethnography (iv) Linguistics, (v) Human Biology (with X ray sub-section), (vi) Comparative Morphology (with Anatomy and Vertebrate Zoology sub-section (vii) Somatology and (viii) Bio-chemistry

The Department has at present three regional research stations situated at Shillong Nagpur and Port Blair (Andaman and Nicobar Islands) There is a proposal for establishing another research station in South India

These research stations located in areas of large concentration of tribal groups facilitate field surveys conducted in cooperation and coordination, and often jointly with the Headquarters

During the last ten years the members of the Department have published 122 scientific papers in various journals The Department itself has during the same period brought out four bulletins two memoirs and one Tribal Map of India two cumulative indexes and three translations in Hindi Bengali and Tamil of a booklet on the Racial Elements of India

It is proposed to open an Applied Anthropology Section whose main job will be to advise the State Governments Social Welfare Organisations and others in the implementation of social welfare schemes

Interest in Anthropological studies has grown in recent years and seven Universities are now offering post graduate courses in Anthropology

The Government of India have set up the Central Board of Anthropology to establish closer contacts with the Universities on the one hand and with the administration and welfare Departments of the Central and State Governments on the other

—o—

ANATOMY OF OUR PLAN

By S KRISHNA

WITH the announcement of the Central Government s budget for the year 1958 59 the old financial year (1957 58) bade good bye yielding place to the new It is worthwhile, however to pause a little and take stock of the progress we have made and the difficulties we have encountered on the economic front Despite its many unhappy patches living in 1957 58 was indeed a stimulating experience to every Indian When one looks back to 1947 one feels astonished at the rapid transformation that has taken place in India s economy since the dawn of independence

Behind this transformation is the story of great efforts on the part of the people of India Thus the first decade of freedom will go down in the annals of India as a significant period in her industrial and commercial development

A broad and critical survey of the last year particularly from an economic angle and also the important events leading to the present imbalance in the foreign exchange situation will not only be interesting but have some educative value too

A slowing down of the tempo of development plans following an aggravation of the food problem inflationary pressures, short fall in resources due to the upward revision of estimates and a steep depletion in the country s foreign exchange resources—all combined tell us that jerks and jolts are inevitable in planning

There are some inescapable and essential factors to be remembered in evaluating the achievements of the government At the very outset, it should be admitted that the Indian economy has long ceased to remain stagnant It has become dynamic and progressive It has been trying to make good almost a century old deficiency in the economic sphere in as short a time as practicable by democratic means In the process of development some imbalance in certain sectors of economy is bound to arise and there should not be any undue exaggeration of the current stresses and strains in the economy which are largely the result of an increased tempo of industrial progress Yet one more point that we need ... is that India has been trying to ... herself up largely through her own

Perhaps the one valuable lesson that 1957 has taught us is that only a steadily increasing agricultural surplus can sustain a process of industrialisation in an economy which is still basically agricultural

The severe jolts we received on the foodfront provided a sad though salutary reminder of the danger that complacency on the front could spell In the same way the distressing foreign exchange crisis served to highlight the need for a supreme internal effort for mobilising rupee resources to the fullest extent. Apart from this crisis is the crisis of confidence that is fast corroding our enthusiasm No hurdles are insurmountable if people s moral is high if the Plan has th solid backing of the popular enthusiasm

Review Of Production Trends

Production Of Foodgrains

The output of foodgrains in 1956 57 was larger than in the previous year Details are given in the Table below The index of agricultural production which had declined from 116 4 in 1954 55 to 115.9 in 1955 56 recorded a sharp increase to 123 0 in 1956-57 The production of cereals went up from 54 5 million tons in 1955 56 to 57 3 million tons in 1956 57 Rice output was 1 3 million tons higher wheat output recorded an increase of half a million tons

Output of foodgrains

	(In million tons) 1955-56	1956-57	Percentage increase in Index
Rice	26 85	28 14	4 8
Wheat	8 57	9 07	5 8
All Cereals	54 46	57 25	5 1
All Foodgrains	65 29	68 69	5 4

Industrial Production

Industrial production has recorded a rise but at a rate lower than that of the last two years The index rose from 113 in 1954 to 122 in 1955 and further to 133 in 1956 For November 1957 the index was 148 Considering the production trends for the period January to November, the rise in index for the year is likely to come around 4 per cent. This slackness in the rate of growth of production was shared by both producer and consumer

The following table shows the progressive rise in industrial production since the beginning of the First Five Year Plan

Industrial Production

Year	*Jute Manufactures (000 tons)*	*Cotton Textiles (Million Yds.)*	*Sugar (000 Tons)*	*Pig Iron (000 Tons)*	*Steel Ingot and Metal for casting (000 (000 tons)*	*Finished*	*Cement (000 tons)*
1	2	3	4	5	6	7	8
1951 52	931 4	4244 7	1222 4	1740 0	1533 5	1056 4	3292.4
1952 53	909 4	4768 0	1405 1	1692 1	1586 4	1058 4	3576 8
1953-54	864 0	4964 6	1138 9	1674 6	1531 9	1077 5	4027 4
1954-55	971 1	5075 7	1294 4	1773 3	1694 7	1202 4	4414 5
1955-56	1053 6	5151 4	1700 7	1786 7	1713 2	1221 9	4506 2
1956 57 *	1065 5	5420 2	2002.0	1796 7	1721.9	1266 5	5080 9

* Provisional

Though the rate of growth of industrial production has tended to slow down, yet there have been sizable additions to installed capacity in a large number of industries such as power transformers, electric motors textile machinery machine tools sewing machines automobiles grinding wheels sugar etc

The expansion of capacity in the existing steel plants is proceeding satisfactorily and an increase in steel production of about 500 000 tons (annual rate) is expected in 1959 Besides this construction work in respect of a number of industrial projects *has been* commenced

National Output

The level of national output (i e goods and services of all kinds) has registered during the year under review a rise fairly comparable with the average rate of increase (about 5 per cent) postulated in the Plan At this stage it is necessary to make it clear that if the inflationary pressures continue to persist for a considerable part of the year the explanation is to be found in the high levels of demand associated with the increasing tempo of development plans Thus the slowing down of the rate of growth of industrial production mentioned earlier can under such *circumstance* be due to bottlenecks at particular points rather than to a deficiency of demand

Prices And Balance Of Payments

The index of wholesale prices (1952 53 100) rose from 106 in March 1957 to 112 in July August 1957 Since September there has been a fairly continuous downward trend the current level being around 105 Thus at the beginning of 1958 the index is slightly lower than it was at the beginning

---

The marked pressure on balance of payments noticed since April 1956 continued through 1957 The current account deficit for 1956 57 aggregated to Rs 293 crores and the deficit for the first half of 1957 58—amounted to Rs 298 crores

During the year withdrawal from foreign exchange reserves amounted to Rs 232 crores as against the planned draft of only *Rs 200 crores during the entire Plan period* The reserves fell from Rs 746 crores at the beginning of the Plan to Rs 534 crores in December last year and later further came down to Rs 302 crores on December 10 1957 Naturally the payment difficulties during this period necessitated an amendment to the Reserve Bank of India Act permitting the lowering of the minimum reserve from Rs 515 crores as required under the Act to Rs 200 crores including a minimum reserve of Rs 115 crores in gold

The major factor in the sharp deterioration in the balance of payments has of course, been imports This proves that at this point the impact of the growing tempo of development has been felt most In 1956 57, imports went up from Rs 230 crores in the first quarter to Rs 306 crores in the fourth There was further acceleration in the first quarter of 1957 58 the imports for April June going up to Rs 323 crores The second quarter recorded a decrease the imports receding to Rs 299 crores Over the first six months of 1957 58 imports amounted to Rs 622 crores

It is distressing to note that there has been no advance in exports More distressing is the fact that the amount for the first two quarters of 1957 58 works out to the lower f... of R 267 crores ... comp... d to R

288 crores for the corresponding period of 1956 57

Economic Policy And Measures

For quite some time and particularly from May 1957 onwards it has been quite clear that the development programmes under implementation were causing an excessive strain on the economy and that it was necessary on the one hand from the point of view of internal price stability and on the other to maintain a more viable position on external account to take effective steps to correct the imbalance. In the White Paper of March 1957, the steps already taken in fiscal monetary and foreign exchange fields have been reviewed It is emphasized therein that the problem was not one of correcting some kind of an accidental or temporary disequilibrium that had somehow arisen but of increasing production especially food production and of generating sufficient savings in the economy to support the accelerating investment programmes envisaged in the Plan

In the field of foreign exchange the bitter lessons learnt in the latter half of 1956 account for progressive tightening up of the import policy since January 1957

It is certain that the need to conserve foreign exchange with the utmost care will persist throughout the Plan period Consequently every effort has to be made to promote exports

What Future ?

For the sake of emphasis let it be repeated that the inflationary pressures of 1956 57 (and the earlier part of 1957 58) and the serious strain on the balance of payments are related mainly to the progressive rise in investment that has been taking place over the past few years both in the public and private sectors Capital formation in the public sector has been steadily going up the rate of investment in the private sector has also been high

In order to secure a steady flow of investible funds from abroad (to reduce the foreign exchange gap to the level of resources) imports have to be cut down and exports augmented Foreign exchange reserves at the end of January 1958 stood at about Rs 285 crores. The scope for a further withdrawl is severely limited

The experience of the last two years has amply shown that the impact of the Plan on the balance of payments was under assessed when the Plan was formulated The emergence of inflationary pressures and their resistance at a time when Plan outlay for the year was still about one-sixth of the five year target (and even less in terms of the revised cost figures) has also highlighted the relative shortage of internal resources as well

The annual plans worked out by the planning Commission in consultation with the Central Ministries and the States therefore involve some adjustments with regard to the selection of projects to be started immediately as well as the amount of expenditure to be incurred on them Some adjustments have also had to be made in the light of the foreign exchange situation

The Major Decisions

The Government has taken two major decisions regarding adjustments in the Plan In the first place it has been decided that the ceiling for financial outlays by the Central and State Governments will remain unaltered at Rs 4 800 crores In view of the increase in the cost estimates of some of the development projects there would be need for marginal adjustments in expenditure ceilings for such projects Secondly in view of the foreign exchange difficulties it has been decided that fresh foreign exchange commitments are to be made only for the core projects and for projects which are already in an advanced state of execution and also certain other important projects for which foreign assistance on favourable terms becomes available

Though the outlook on foreign exchange resources for the Plan is not so bleak as it was a year ago yet it must be admitted that the current crisis is the result of the co existence of the export structure of a semi subsistence economy and the changing structure of imports of a rapidly developing economy While admitting that the next two years would undoubtedly be critical from the payments point of view, we must not forget that our present difficulties carry with them a creative potential which would begin giving rewards for our patience and labour as projects now in progress are completed

In the interim period it may be further necessary to utilise our reserves, but to tide over the crisis we will have to endeavour our best to promote export and to keep imports to minimum

To sum up the country s Second Plan is passing through the last stages of the teething troubles The health of the economy is basically sound because our plans and priorities seem to have been well conceived To the critics of the Plan the only answer is to wait and see and later cast-off their pessimism

EDUCATION IN THE WESTERN WORLD

By Dr JAMES B CONANT

Schools and Universities in various countries are a product of the society which they serve as well as an influence on the future of that society—to declare that one system is superior to another because it is different is as irrelevant as to say that a whale is a better mammal than an elephant

TO one interested in comparative education, it is fascinating to see how today, many nations are struggling to solve the basic problems connected with the selection and education of future members of the professions To a comparative educationalist many questions about the selection and training of doctors and lawyers in different countries are questions almost without meaning Asking whether European schools are better than schools in the United States is like asking a comparative anatomist whether a whale is a better mammal than an elephant

The comparative anatomist is interested in examining the similarities and differences to be found in animal or plant organs which carry out the same function he is very cautious however about proclaiming the virtues of a device found in one particular species over a device for a similar purpose found in another Of course the anatomist knows that mammals are modified only by changes in environment unlike schools or colleges the structure of the functioning organism he is examining cannot be altered radically by man made decisions

Some will argue that this vitiates my analogy they may claim that the essence of human organisations lies in the fact that conscious acts of men and women can change them and as history shows overnight if need be "But wait a moment the student of comparative anatomy of schools will say, 'not overnight surely except at the point of a bayonet or in our time under the shadow of armoured vehicles and tanks And such changes he will argue, are the equivalent of pathological alterations

History shows that, except under conditions of duress brought about by external forces, schools and colleges have developed gradually in different parts of the world in response to a variety of different conditions They are a product of the society they serve and they also influence the future of this society Reformers who have sought to change education have had to devote a life-time to their task.

It is clear that various educational devices have been outmoded in the past by social changes The situation of Oxford and Cambridge during the first two thirds of the 19th century is a case in point For two generations many leaders of public opinion argued for the need of either establishing modern universities in England or reforming the two ancient seats of learning Eventually both courses of action were followed the modification of Oxford and Cambridge by successive royal commissions was so radical as to constitute the equivalent of a series of drastic biologial mutations By the end of the century English universities were once again well adapted to the tasks at hand

I should like to approach the subject of education for the professions in the mood of the comparative educationalist I should like to examine in particular the way the future members of the professions are recruited selected and educated in certain European nations and the United States

For a number of professions one phase of professional education—the final stage so to speak—is essentially identical in all countries. There is little to be gained by noting the minor differences to be found in various nations This is true of medicine of engineering and of the natural sciences; it is likewise true to a lesser degree of certain areas within the social sciences and the humanities It is possible to pass judgement on the work of the medical faculty of a university for example almost without taking into account the traditions of the institution or its surroundings Considering the training of a medical man only from the standpoint of professional competency it would not be too difficult to classify all the medical schools of Europe and America into groups according to their degree of excellence. The same would apply to the training of engineers and research scientists

It is not so much professional education as the education provided prior to professional studies that varies from nation to nation This is particularly true if one directs

attention to the way the future members of the professions are recruited and selected Nowhere on the European continent will one find the equivalent of the American four year liberal arts college The European youth unlike his American contemporary passes directly from a university preparatory school to professional training

Americans find it difficult to imagine an educational system without a college Europeans find it hard to imagine what sort of an institution an American college can be The task of explaining the situation in the United States to a German for example is not made easier by the fact that there are over 1 500 four year colleges in the United States some part of a university some not their curricula and criteria for admission and graduation vary enormously the one thing they have in common is the right to award a bachelor s degree an academic symbol derived from the Middle Ages which has completely disappeared in German speaking nations though not in France

One sometimes hears it said that the charcteristic feature of American education is the proportion of the nation s youth attending a university So phrased this is a completely misleading statement What is characteristic is the very large proportion of American youth from 18 to 20 years of age who are engaged in full time studies The fraction is something like a quarter to a third in Great Britain, France Germany and Switzerland not more than a tenth of the youth are so engaged Equally characteristic are the figures for school attendance at the age 16 to 17 In the United States more than 75 per cent of those of this age are in school full time in European countries and Great Britain the corresponding figure is less than 20 percent Some Europeans have said that only a rich nation could afford to keep so many of its youth in school so long But with the increase in automation it is a question whether the withdrawal of a considerable fraction of youth from th labour force is a luxury The type of training needed in the distributive industries more and more requires considerable ' book learning

At all events when we consider the proportion of youth engaged in professional studies the position of the United States is not so different from tha of the rest of the world Perhaps it is fair to compare the proportion of young men enrolled in the first year of a university in Europe or Great Britain to the proportion in the United States enter engineering, law medical schools and starting graduate schools of arts and sciences the figures for young men the proportion the United States seems to be something 6 percent, surprisingly small

But what is equally surprising is that figures represent the situation in all nations which I have seen statistics Therefore one could say that the proportion of youth *professionally* in a university is about the in the United States as in other nations What is different between America and Europe is the method by which this very small percentage is selected and educated prior to engaging in professional studies

Today unlike the situation of 100 years ago the education of members of the professions (particularly natural scientists and engineers) is a concern of statesmen Public opinion has an interest in hearing the answers to such questions as the following Are we training enough professional people? Are we including in our education for the professions a large fraction of those who have the requisite ability or are we overlooking many with high potentialities?

In a totalitarian state these questions lead directly to a control of the entire educational process the capable are to be sorted out and educated for the different professions according to the nation s need for these professions. This is essentially the directive of the Party Executive Committee to those in charge of schools and universities in the Soviet Zone of Germany In a free country the political situation is very different not only because of the impossibility of governments ordering youth into different educational channels but because of the freedom of parents to express their desires to school authorities and if need be to politicians

National concern with the number and quality of scientists and engineers is clearly a result of the last phases of the industrial revolution which started 200 years ago Parental concern with education as a way by which a son may better himself economically and socially is a consequence of the spread of that spirit of democracy of which Tocqueville wrote more than a century ago It has taken time for the equalitarian doctrines of the French Revolution reinforced by American notions to affect European education but there is no doubt that the problem of selecting future university students is becoming more rather than less difficult in England and a number of European States The question of social prestige is becoming involved as it has been involved in America for at least 50 years

Let m ...

During World War II the British Parliament made certain changes in the English system of tax supported schools Among the objectives which the new legislation sought to achieve was the widening of opportunity for children of the less well to-do another was an elimination of the great difference in prestige that in the past had characterised one type of tax supported school as compared to another The traditional view of the content of a school programme was however, not modified. A long course was held to be necessary and selection of those capable of entering those schools which provid ed this course was to be made at the age of 11 to 12

From the point of view of a parent with a low income and a talented child, the new arrangement must appear to be better than the old But parents of medium income view the altered situation highly critically In the past, the "grammar schools had provided excellent roads to the universities open to those who could afford to pay a moderate fee (For well-to-do families the usual road to the univer sity is provided by the famous 'public schools ') The new regulations abolished the fees and made the admission of *all* children subject to a competitive examination To make matters worse, so some parents have said a new type of examination is employed—so-called psychological tests —that has no apparent relation to school work ! As a result the whole subject of selection age at 11 plus is a topic of heated discussion among educators and laymen

In one county in England the experiment is being made of abolishing the examination in two selected geographic areas and sending all children from 11 to 15 to one school and then providing grammar school places for those whose parents are willing to keep them in school until at least 16 Presumably ability to handle the work in the grammar school will be the determining factor in deciding who goes on to the university The article in the London *Observer* reviewing the experiment carries the heading Eleven plus Condemned. This caption corresponds to the sentiment expressed in a number of articles and letters to the editor that have been ap pearing in British journals and papers for the last few years

On the European continent too difficulties have arisen in regard to the process of select ing those who are to attend the Gymnasium in preparation for a university education Each one of 11 states in the Federal Republic educational matters so too have the 25 cantons in Switzerland (with a few exceptions) A comparison of the roads to the university in each of these is interesting it shows how different local conditions have modified, to a certain degree the European pattern The points at issue are often the exact length of the pre university schools course and the methods by which pupils are selected for the special pre university schools

The parental pressure varies greatly from place to place and reflects differences in tradition and economic circumstances Sometimes the selection can be made solely on the basis of advice given by teachers and accepted by parents Sometimes examinations are required in order to decide who should start on the road to the professions If so parental protests frequently arise In one German state I heard a mother complaining that the entrance tests for the Gymnasium were so foolish and arbitrary that many of the friends could not get their children admitted as a consequence the parents were pressed into the expense of sending them to private schools In France where the road to the professions has been studded with stiff competitive examinations anguish over the selection process has been particularly acute The entrance examination for the pre univer sity schools (Lycees) have just been abolished and the programme in these schools lightened Selection of the pupils who head for the university is now to be made on the basis of the primary school record In Switzerland the psychological effect on the child of failure in the pre university school (in some cantons a half to two thirds drop out) is giving concern to the school authorities

In several German states parents have brought suit against the government because a child had been barred from a pre university school The matter has even become a political issue It is not the method of selection but the length of the pre university school course that is in controversy If the course is nine years then selection must be made at the age of 10 to 11 this was the usual pattern in Germany I judge years ago But in the post war years in some states the pre-university course was shortened and the time of selection correspondingly postponed

The arguments in favour of keeping all the children together in one school as long as possible are familiar to Americans an addi tional (and for Europeans more weighty) argument for a shorter pre university period of ... may ... easier to select those

suited for university work at 12 or 13 rather than 10 to 11 The abbreviated course has been attacked however on the grounds that nine years are necessary if the pupil is to master the subjects required for later university work (particularly Latin) The differences of opinion on the matter seem to run along the usual lines of political cleavage in both Germany and Switzerland, in general the moderate right favours the longer course the moderate left the shorter

In one state election in Germany the issue was of major importance This is hard for Americans to understand since the difference of opinion appears to be relatively slight and the educational question involved touches the schooling of not more than a fifth of the children It is interesting to us as evidence of the intimate connection between school problems and sociological questions

From what I have already reported it is clear that the age at which selection is made and the time it is made are intimately associated with the content of the pre university course of study And here we meet the second major difference between the road to the profession in Europe and in the United States In Europe the state determines the requirements which must be satisfactorily fulfilled in order to obtain on finishing school the necessary credentials which will enable the holder to enter a university In Germany and Switzerland for example the certificate which a youth obtains after passing a set of final examinations in the last school year is an admission ticket to *any* university The absence of any such uniform requirements in the United States astonishes and perplexes the European observer of the American system.

Though each state in the Federal Republic of Germany is autonomous the standards throughout are essentially the same Certain variations in the subjects on which a student is examined are permitted but one may say that the essential subjects are languages and mathematics In the classical Gymnasium (in Germany called the humanistic school) Latin and Greek are obligatory in most of the others Latin and at least one modern foreign language in a few schools exposure to a heavy dose of modern languages mathematics and natural science is considered a substitute for Latin A European university is not an American college and language instruction is not one of its functions scientists lawyers medical men economists and historians therefore have no opportunity for studying any

in mind one realises why a long school ... is believed necessary for future un... students The central position occupied ... the curricula of pre university schools ... foreign languages is a reflection of the ... played by both tradition and geography ... cational matters As far as future ... men are concerned Europeans are con... that the traditional education in ... literature, mathematics and European ... comprises the best general education

For the 75 or 80 percent who have ... ambition or no opportunity to head for ... university formal full time education end... at 14 or 15 further educational development in part time courses will depend on the occupation of young man or ... man in question The apprentice system together with continuation schools takes ca... of industrial workers it may be said For apprentices with special mechanical aptitude technical schools are available For the 10 percent and so who must drop out of the pre-university schools some special type of education with more emphasis on practical business affairs is needed This the European would grant but the idea of a general education for a large proportion of adolescents aged 16 to 21 is unheard of on the continent of Europe

How is it at the end of the road one may ask Are those Europeans who complete the hard journey and arrive at a university and later become professional men (some 6 percent of the young men) better educated than the corresponding Americans ? This is the type of question a comparative educationalist refuses to answer For so much depends on your standard of judgement on what basis you evaluate the non professional knowledge ability, and attitude of a professional man or woman.

One thing is certain the average American medical man lawyer chemist, physicist or engineer has acquired a quite different store of general knowledge from that of his European counterpart If command of foreign language is the test of a well-educated man or woman relatively few Americans can claim to be well educated If knowledge of European literature and art is taken as a measure, there again the average American professional man will fail in comparison with the European European pre university education is in essence literary education American college education can rarely be so described.

On the other hand, every American ...

least a bit of some of the social sciences Indeed perhaps the majority of those whom we are here considering will have acquired a considerable knowledge of economics and political science a large portion will have studied psychology and sociology With rare exceptions these disciplines are available only to a European in a university and while the student enrolled under the law faculty may find time to listen to some lectures in these fields the medical man and natural scientist will not

In other words those Americans who complete at least three years of a four year liberal arts college course will have had a kind of academic experience unknown on the continent of Europe (A possible exception to this statement is the education provided for the future teachers in the pre university schools who are educated in the famous Ecole Normale in Paris and in the philosophical faculties of the German universities)

It is not only the content of the programme which characterises the American college The whole atmosphere is different from either a European school or a European university There is far more freedom for the student than in a school of course and there is far more personal instruction of the student by the professor than is possible in a university of the European type with its relatively small staff in proportion to the size of the student body The American student is ready to express an opinion to anyone discussion is encouraged at every turn Student activities ranging from dramatics through debating and journalism stimulate student independence there is no parallel to these expressions of student initiative in Europe All of this, of course reflects what Americans have come to believe are important aspects of college education

Indeed one can sum up the comparison I have been making by saying that the leading citizens of Europe and the United States have quite different aims in mind when they talk about education as apart from professional training The difference reflects the different social histories on the two sides of the Atlantic

As a first approximation, one may say that Europe adjusted its education to modern times nearly 100 years ago A period of rapid educational change on the European Continent took place in the middle of the 19th century this reflected the first impact of industrialisation The pattern thus established has persisted to the present with relatively few changes, it is obviously intimately associated with the apprentice system of training industrial workers and a relative lack of geographic and social mobility It also reflects the powerful influence of the university faculties which were well entrenched when the educational changes were in progress—particularly the influence of the professors of the classics

During the period of change in the United States in which we are still living traditional academic forces have played a far less important role But such social factors as the raising of the school leaving age in the United States and the near disappearance of the European apprentice system were of more importance in determining the shape of the new educational system which is now *emerging*

I have written ' emerging because it is clear that in the United States we are still in process of adapting our schools, colleges and universities to the current needs of our society (and trying to adapt to future needs as well) In England too a process of change has been and still is at work In the nations of Western Europe on the other hand (with the exception of Scandinavia) few alterations in the system have been made in the last 50 years though there are many educational problems similar to those in the United States and England a period of reform has not yet begun

An American observer cannot help wondering whether such a period is considerably overdue. It may well be that the more immediate political and social issues in France and the urgent task of reconstruction in postwar Germany have merely pushed aside consideration of educational changes I seem to detect signs of dissatisfaction in the Federal Republic of Germany which may be the prelude to important actions In parts of Switzerland the road to the professions is being resurveyed In France a few important changes have just been made and a bill providing for a drastic alteration in the French system has been introduced into Parliament by the Minister of Education

We in the United States are still engaged in remaking our educational roads the nature of the task varies considerably from state to state from community to community Pedagogic devices and plans for the organisation of schools and universities are not always transferable across state lines they are almost exportable to foreign countries Nonetheless the exchange of the ideas and blueprints is always helpful because it stimulates and arouses discussion

(*Continued on 452*)

Intelligence Test

(Below are given some questions to test quickness of your mind and intelligence It does not matter that you attempt all the questions What matters is the time taken by you to find the correct answers The whole paper should not take more than 30 minutes to a fairly intelligent person. Try now and find out)

—QUESTIONS—

1 Read the following passage carefully and try to find a solution

The Problem of the Balls

In the Land of Nowhere there is an extraordinary bridge which is two miles long and crosses a rocky ravine one mile deep The bridge is extraordinary because it can support a weight of only two hundred pounds although this weight may be distributed in any way along its surface

To this strange bridge there comes a young man who is light of heart sure of hand, strong of will and keen of mind He bears three balls each of which weighs two pounds Heeding the danger sign at the approach to the bridge he steps on a scale provided by the Government of Nowhere To his consternation he finds that he weighs 195 pounds The balls, of course total six extra pounds

The young man however is restrained only for a moment While all the officials of Nowhere are transfixed by shock, he blithely proceeds to apparent destruction as he makes for the bridge carrying his spherical cargo with him.

How that bright young man got across safe and sound balls and all is now a legend in the Land of Nowhere The question is how did he do it ?

2 There is a stranger lurking in each one on of these groups Can you find it ?

(i) fratricide patricide homicide suicide matricide

(ii) octagon, pentagon, triangle square, paragon

(iii) stilette machete, dagger sword bayonet. boomerang

(iv) schism split divide crevasse fissure obturate.

(v) zoology phytology morphology zoonomy anthropology

3 Change the first word to the second in a series of steps like dog to cat Dog to dot to cot, to cat

(i) DATE to LOVE
(ii) DUST to WASH
(iii) MOTH to FIRE
(iv) TAKE to JAIL
(v) BIRD to WING
(vi) SLOW to FAST
(vii) WOOD to COAL
(viii) POET to BARD

4 Take the added letter and make a new word out of the old—*eg* fight with an L is flight

(i) LIGHTS with an E
(ii) TORE with a U
(iii) PEAT with a D
(iv) TERSE with a T
(v) BONE with a Y
(vi) REAL with a C
(vii) GRAVY with an A
(viii) SHONE with a C
(ix) ODOR with a P
(x) REVILE with an E
(xi) KISS with an L
(xii) CLAP with an E

5 In the following sentences you will find the names of famous people buried. For example

"I say John why don t you shake Speare s hand ?

Shakespeare is the answer, of course

(i) The washing toned down the landscape beauty

(ii) 'Pshaw you can t do that," said Mary

(iii) The light s ray burned brightly

(iv) Frank lined his men up for drill.

6 In code *rhubarb ozone relics* means Foreign Office secrets *relic fumeste* means Secret Service *rhuhard caravans* means Foreign Affairs What is the last letter of the code word meaning Offices ?—

(*a*) N (*b*) E (*c*) B (*d*) S (*e*) C

7 Here are some well know quotations in each of which one word has been changed Which word is it and what should it be ?

(i) Shall I not take mine comfort in mine inn ? (Shakespeare)

(ii) Thus conscience does make cravens of us all (Shakespeare)

(iii) The time is out of joint O cursed spite !
That ever I was born to put it right
(Shakespeare)

(vi) Or if virtue sickly were
Heaven itself would stoop to her (Milton)

(v) A little knowledge is a dangerous thing
Drink deep, or taste not the Pierian spring
(Pope)

(vi) God tempers the blast to the shorn lamb (Sterne)

(vii) The Boy is father of the man (Wordsworth)

8 Find the animal hidden between words in the following sentences

Example Do not criticizebravado too readily Answere zebra.

(i) Fireproof awnings are safer

(ii) Small boys tag after their elder brothers

(iii) Those who do good may be rewarded

(iv) A classic attraction was the art exhibit.

(v) The enormous entrance dwarfed him.

(vi) Hot terrapin soup is relished by many people

(vii) The bootleggers would highjack all trucks

(viii) Wholesale murder was practised by the bandits

(ix) The British are expected to do their duty

(x) The mother asked the rabbi to come at once

9 Read very carefully through the following poem at least twice and then answer the questions set on it at the end

NIGHT PIECE

Her eyes the glow worm lend thee,
The shooting stars attend thee,
and the elves also,
Whose little eyes glow
Like the sparks to fire, befriend thee
No Will o the Wisp mislight thee
Nor snake or slow worm bite thee
But on on thy way,
Not making a stay,
Since ghost there s none to affright thee
Let not the dark thee cumber
What though the moon does slumber ?
The stars of the night
Will lend thee their light
Like tapers clear without number

1 What do you think this poem is about ?
2 Write the first line as it would appear in prose
3 Why is the glow worm asked to lend her eyes ?
4 Give in your own words the meaning of ' attend thee (line 2)
5 How do elves eyes glow ?
6 Give another word meaning the same as befriend in line 5
7 What do you think is a Will o - the Wisp ?
8 What is meant by " mislight ' in line 6 ?
9 What two things does the poet ask not to bite ?
10 What does "not making stay mean ? (Line 9)
11 Why does the poet say "on thy way not making a stay ? ' in lines 8 and 9 ?
12 Give another word for ' affright in line 10
13 What do you think "cumber' means (Line 11)
14 What will give light even if the moon does not shine ?
15 What are tapers mentioned in line 15 ?
16 Give one word that means the same as the expression 'without number in line 15
17 What do you think " thee ' is in this poem ?

18 Make up a name for an elf and Will o the Wisp

10 The words in the following sentences are mixed up Write out the sentences correctly

(i) flies where the in go time the do winter ?
(ii) than careful better is it be sorry to
(iii) Kettle a never boils watched
(iv) where will there a is there way a is
(v) chickens before count hatched never they your are
(vi) when think in doubt twice
(vii) laughs who he best last laughs

ANSWERS

1 He juggled the balls enroute One ball was always in mid air The bridge had to support only 199 pounds

2 (i) suicide
(ii) paragon
(iii) boomerang
(iv) obturate
(v) phytology

3 (i) date to late to lave to love
(ii) dust to must to mast to mash to wash
(iii) moth to mote to mite to mire to fire
(iv) take to tale to tall to tail to jail.
(v) bird to bard to ward to wand to wind to wing
(vi) slow to slot to soot to moot to most to mast to fast
(vii) wood to wool to cool to coal.
(viii) poet to port to part to pard to bard.

4 (i) sleight (ii) route (iii) adept (iv) setter (v) ebony (vi) clear (vii) vagary (viii) chosen (ix) droop (x) relieve (xi) silks (xii) place

5 (i) WASHINGTON
(ii) SHAW
(iii) RAYBURN
(iv) FRANKLIN

6 (d)

7 (i) comfort- ease
(ii) cravens cowards
(iii) Put : set
(iv) sickly feeble
(v) Knowledge learning.
(vi) blast wind
(vii) Boy child

8 (i) Fawn. (ii) Stag (iii) Dog (vi) Cat. (v) Mouse (vi) Otter (vii) Jackal (viii) Lemur (ix) Hare (x) Rabbit.

9 1 It is about the Queen of the fairy who is telling all things of Nature to help and not hinder one of her subjects who has to pass through the forest on an errand (For 4 lines)

2 Let the glow worm lend you her eyes

3 To light up the way for the fairy messenger

4 Help you, be with you

5 "Like sparks of fire' (Line 5)

6 Assist, help

7 A light seen in marshy districts that glows in different places and so leads people astray because they think that it is a stationary light

8 Lead astray

9 (i) snake (ii) slow worm

10 Not stopping

11 Because there is no ghost to frighten you

12 Frighten

13 Hamper, hinder

14 Stars of the night (Line 13)

15 Candles

16 Numberless

17 A fairy

18 Puck an elf, and Jack Shine o' Lamp a Will-o the Wisp

10 (i) Where do the flies go in the winter time ?
(ii) It is better to be careful than sorry
(iii) A watched kettle never boils.
(iv) Where there is a will there is a way
(v) Never count your chickens before they are hatched
(vi) When in doubt think twice
(vii) He who laughs last, laughs best

—o—

(Continued from page 449)

We may watch with interest, therefore the new developments in those Western nation from which came originally the American cultural traditions and ideas about education The free nations of the world in planning for their youth as in many other matters must be in constant communication, for however diverse their methods their fundamental aims remain the same : the preservation and extension of person[illegible] freedom.

[illegible]hed (*The Atlantic Monthly*)

GENERAL KNOWLEDGE TEST

Test your knowledge Solve the following questions without any extraneous help When finished, look up for the answers and compare Try and see

QUESTIONS

1 (a) What were the new taxes proposed by Kaldor in his Report on Indian tax structure ?

(b) Describe the details of the Gift Tax introduced in the Indian Budget (1958 59)

2. (a) Write a note on the United Arab States

(b) Do you consider it as the prelude for pan Arab unity ?

3 Examine the views of the Estimates Committee on the necessity for reorganizing Planning Commission

4 Name the following —

(1) Indian Ambassador to United Arab Republic
(2) Prime Minister of Thailand
(3) Leader of Indonesian Rebel Government
(4) Chief of Staff of Indian Navy
(5) Finance Minister of Kerala.
(6) Prime Minister of Rumania
(7) Union Minister for Irrigation and Power.
(8) Mayor of Bombay Municipal Corporation
(9) U N Truce chief in Palestine
(10) Chairman of Life Insurance Corporation.

5 Who or what are they ?

(1) Siroky (2) Alpha 1958
(3) Strauss (4) Albert Camas
(5) Bokaro (6) Balwantrai Mehta
(7) Medan (8) Prince Aly Khan

6 What do the following abbreviations stand for ?

(1) I C C R (2) O M
(3) D G R & E (4) I B R D
(5) K. M. T (6) I G
(7) N R D C (8) O G L

7 Who wrote the following books ?

(1) Some Inner Fury
(2) Economics of Reconstruction
(3) Kalyani's Husband
(4) Men and Rivers
(5) A Brave New World
(6) Remember the Hou e
(7) Mrs Warren s Profession
(8) The Time Machine
(9) A Pair of Blue Eyes
(10) Chemmeen

8 Name the capitals of the following countries

(1) North Vietnam (2) Israel
(3) Malaya (4) Iceland
(5) Cyprus (6) Malta
(7) Lebanon (8) Netherlands
(9) Brazil (10) Mongolia

9 Briefly explain the following terms ?

(1) Plenipotentiary (2) Ketchup
(3) Bank Rate (4) Terra cotta
(5) Dogdays (6) Carte Blanche
(7) Stratosphere (8) Cubism.

10 What are the major recommendations of the Gorwala Committee Report on Rural Credit ? What is the criticism forwarded against the report by Pandit Nehru recently ?

ANSWERS

1 (a) New taxes proposed by Kaldor were

(1) Wealth Tax
(2) Expenditure Tax
(3) Capital Gains Tax
(4) Gift Tax

(b) The details of the Gift Tax are The Tax will be levied on the donor on the value of all gifts made by him during a year but for the purpose of determining a rate of duty the gifts made during the four years preceding the year will be aggregated Such aggregation will be made only in respect of gifts made after the date this tax comes into force Gifts upto a total value of Rs 10 000 in any one year will be exempt If the value of gifts made during any year exceeds this sum only the excess will be subjected to tax. The basic exemption will be r duced to Rs 5 000

if gifts to any one individual donee during a year exceed Rs 3 000

Some other important exemptions are

(a) Gifts to Central and State Governments Local Authorities and charitable institutions

(b) gifts to female dependents on the occasion of marriage upto Rs 10 000 in each case

(c) gifts to one s wife upto a total limit of Rs 1 lakh

(d) gifts to dependents of policies of insurance up to Rs 10 000 for each

Rates of the Tax Same as for Estate Duty except that the first slab of Rs 50 000 will not be exempt from the tax The rates range from 4% on the first slab to 40% on gifts over Rs 50 lakhs

The yield from the Gifts Tax is estimated at Rs 3 crores

This will fill a gap in the scheme of direct taxation and will not only make evasion or avoidance difficult but also spread the tax burdens more equitably

2 (a) A plebiscite held in Egypt and Syria on February 21 resulted in an overwhelming majority for the union of the two countries and in the election of Colonel Nasser as first President of the United Arab Republic (U A.R.) President Nasser formed the first U.A R cabinet on March 6

An agreement establishing a federal union between the United Arab Republic and the Yemen, under the name of the United Arab States was signed in Damascus on March 8 by President Nasser and the Crown Prince of the Yemen Mohammed el Badr

Orders issued by the Supreme Council on March 13 appointed Field Marshal Hakim Amer as C in C. of the armed forces of United Arab States, named the Yemeni port of Hodeida as the permanent seat of the Federal Council which however would also meet periodically in Cairo and Damascus and set up a central currency organization for the Yemen, with authority to issue currency and control financial operations A new paper currency would be issued—to be known as the Yemen pound with the same value as the Egyptian pound—and silver rials of the same value as the existing Maria Theresa thalers would be the smaller monetary units

The Total population of the United Arab States is about 35 000 000—23 000 000 Egyptians 4 000 000 Syrians and 8 000 000 Yemenis

(b) Opinion on this question is divided. Many people consider this as a positive step to the establishment of pan Arab unity But there are others like the Iraq foreign Minister Dr Jamali who denounce this as an unnatural union and a forgery and a farce Another section alleges that the real motive behind the union is the establishment of Arab unity against Israel

3 The Estimates Committee of the Lok Sabha has made out a strong case in its latest Report for the re-organisation of the existing set up of the Planning Commission In its Report the Committee has expressed doubts as to whether the Prime Minister should continue as the Chairman of the Planning Commission. The Committee states that although his formal association was necessary during the formative stages it is a matter for consideration whether it is still necessary

Similarly the Committee feels that there was hardly any need to continue the formal association of the Finance and other Ministers with the Commission Consultation and co-ordination with the Ministries can be effected by inviting the Minister concerned to its meetings

Criticizing the present arrangement of having the Cabinet Secretary to function also as chairman of the Planning Commission as neither necessary for high level contacts nor conducive to efficiency the Committee has suggested the appointment of a whole time Secretary for the Commission

The Committee is of the view that the role at present played by the Planning Commission in the annual and periodical allotment of finances should be left as far as possible to the Government leaving the Commission to concentrate on the formulation and evaluation of the Plan

It has therefore suggested that the procedure for getting schemes approved for Central Assistance should be so revised as to enable the State Governments to approach the Central Ministries concerned directly

The Committee is also very critical of the existing allocation of States among the Programme Administration Advisers

4 (1) R K. Nehru
(2) General Thanom Kittikachorn
(3) Dr Sjafruddin Prawiranegara
(4) R. D Katari

(5) C Achuta Menon
(6) Chivu Stoica
(7) Hafiz Mohamed Ibrahim
(8) S S Mirajkar
(9) Carl Carlsson Von Horn
(10) P A Gopalakrishnan I C.S

5 (1) Prime Minister of Czechoslovakia

(2) Name of the first U S artificial earth satellite

(3) Chairman of the U S Atomic Energy Commission

(4) French writer who was awarded the Nobel Prize for literature in 1957

(5) A place in Bihar chosen as the site for the fourth steel plant in the public sector

(6) Chairman of the Estimates Committee of Lok Sabha

(7) Capital of Northern Sumatra which was captured by Indonesian rebels during the course of the rebellion

(8) Permanent representative of Pakistan in U N O

6 (1) Indian Council of Cultural Relations
(2) Order of Merit
(3) Directorate General of Resettlement and Employment
(4) International Bank for Reconstruction and Development
(5) Kuomintang
(6) Inspector General
(7) National Research and Development Council
(8) Open General License

7 (1) Kamala Markandaya
(2) Kenneth E Boulding
(3) S Y Krishnaswami
(4) Humayun Kabir
(5) Aldous Huxley
(6) Santha Ram Rau
(7) Bernard Shaw
(8) H G Wells
(9) Thomas Hardy
(10) Thakazhi Siva Shankara Pillay

8 (1) Hanoi (2) Tel Aviv
(3) Kualalampur (4) Reikjavik

9 (1) A person normally an ambassador or envoy invested with full powers

(2) A condiment sauce prepared from tomatoes and spices

(3) The rate at which the Central Bank of a country rediscounts first class Bills of Exchange of short maturity

(4) A kind of unglazed pottery mostly of red colour largely used for building and decoration

(5) It is so called due to the heat and unhealthiness of the period

(6) Latin phrase meaning, unconditional power

(7) A region extending from about 7 to 19 miles above the earth, in which temperature remains constant

(8) Form of art originating with Modern French School

It is characterized by depiction of objects by geometrical or rectangular treatment of them

10 The major recommendations of the Agricultural Credit Survey Committee (Chairman A D Gorwala) Report are

(1) There should be not merely state association, but also state *participation* to a great extent in the co-operative movement

(2) There should be close integration of credit activities with other activities like marketing and warehousing

(3) There is necessity for trained workers who are responsive to the desires and requirements of the rural population

In a spirited speech Pandit Nehru challenged the validity of the committee s recommendation for State participation According to Nehru co-operative movement should be left free from all types of govermental interference Our people are capable of setting up a strong co-operative movement and all these arguments about state participation and intervention only indicate a lack of reliance in the abilities of our masses In fine co-operative movement should be ensured of all facilites for spontaneous and uninterrupted growth

Question Box

In these columns we answer the queries from our readers It may not be possible to answer each and every question but a considered reply shall be given to selected questions Letters from our readers are welcome. These should be addressed to the Editor, Question Box

CAPITAL AND CAPITALISM

Q What is the difference between Capital and capitalism?

(Kulwant Ray Jain, Jullundur)

Ans The term capital is used to describe all those instruments of production which are deliberately made by man for carrying on production in the future. The Chief types of capital assets are machines factories railways, vehicles and the like

Capitalism refers to an economic order wherein the means of production are under private ownership production is roundabout and the motivating force behind investment is private profit

HIGH COURT JUDGE

Q What is th procedure adopted to appoint High Court Judges?

(Suprokash Banerjee Calcutta)

Ans The judges of a High Court are appoint d by the President of India in consultation with the Chief Justice of India and the Governor of the State They hold office until they attain the age of 60 years

ASSISTANT'S GRADE EXAMINATION

Q Wh n will th Assistant s Grade Examination be held? Please furnish particulars of the examination

(Kishen Lal Simla Madan Lal Hosnurpur)

Ans The application has to be submitted to the S cr tary U P S C, Dholpur House, New D lhi Qualification specified is a degree of a recognized university or the Cambridge Hi h r School Certificate A candidate must b at least 21 and not more than 25 years of age (27 years in case of Scheduled Castes candidate) The Compulsory subjects of Examination are (1) English Essay (2) General English (3) General and Economic Geography of India (4) Arithmetic. (5) General Knowledge Scale of pay 160-10-330-EB 15-450

EMBASSY ADDRESSES

Q Please provide me the addresses of the following

(1) United States Information Service Delhi

(2) Chinese Embassy

(3) Russian Embassy

(4) Embassy of U S A

(Ambika Prasad, Allahabad)

Ans (1) U S I S, Janpath New Delhi

(2) Chinese Embassy, 2 Bhagwandas Road, New Delhi

(3) Soviet Embassy, Travancore House Curzon Road New Delhi

(4) American Embassy Bhavnagar House, Sikandra Road New Delhi

BASIC EDUCATION

Q Please explain the aim and purpose of Basic Education.

(D S Sharma, Bilara, Jodhpur)

Ans The scheme of Basic Education seeks to make education free and compulsory for all boys and girls between the age of 6 and 14 to make mother tongue of the child the medium of instruction to make productive manual work the social environment and the physical environment of the child the three main centres of an integrated instruction and bring the school into a closer organic relation with the life of the village or the urban community

WHO S WHO

Q Please furnish the names of

(A) Chairman and Members of the Union Public Service Commission

(B) Chairman of Railway Board

(C P Singh, Muzaffarpur Bihar)

Ans (A) Chairman—V S Hejmadi, C. S, Members (1) A. A A Faizee (2) S V Kannungo (3) J S Pillai (4) C. B Mahajan

(B) P C Mukherjee

Q Please name the following —

(1) Comptroller and Auditor General of India

(2) Financial Commissioner for Indian Railways

(3) Secretary of Central Railway Board

(4) The Director General of Civil Aviation of India

(5) The Director General of all India Radio (*D Solomon Asansol*)

Ans (1) Anil K Chanda
(2) J Dayal
(3) D L Bajal
(4) L C Jain
(5) J C. Mathur

VOCABULARY

Q Please explain the meaning of -
(1) Blitz Krieg (2) Bete noire
(3) Flair (4) Isthmus
(5) Archipelago (6) Clandestine
(7) Paraphernalia. (8) Snob

(*Jagatchandra Dash, Orissa*)

Ans (1) A military term applied to a swift shattering campaign e g that which resulted in the swift fall of Poland, France Yugoslavia and Greece in 1939 41

(2) A French word meaning bugbear

(3) Intuitive discernment

(4) A narrow neck of land connecting two portions

(5) The chief sea of the Greeks or the Aegean Sea a Sea abounding in small islands also a group of such islands

(6) Concealed or hidden

(7) Ornaments of dress or any kind trappings that which a bride brings over her dowry

(8) A vulgar person especially, one who apes gentility

STATISTICS M A

Q Please let me know the Universities in India which provide M.A Degree Course in Statistics Can a graduate in commerce apply for admission to the course ?

C B Com

Ans The following universities provide M A Degree course in Statistics (a) Aligarh University (B) Allahabad University, (C) Bombay University (D) Calcutta University, and (E) Madras University

There is provision for th admission of Commerce Graduates to the above Course in Allahabad University

FOREST COLLEGES

Q Name the Forest Colleges in India with their addresses

(*Nimai Chandra Ghosh, Calcutta*)

Ans These are some of the Colleges

(A) Indian Forest Rangers College Dehradun (U P)

(B) Indian Forest College, P O New Forest Dehradun (U P)

(C) Madras Forest College Coimbatore, Madras State

(D) Forest Research Institute Dehradun (U P)

RADIO ACTIVITY

Q What is meant by radio-activity ?

(*Jagtar Singh Bains Shamgarh*)

Ans The action of giving off alpha or beta particles or gamma rays when the nuclei of certain atoms break down

COMMONWEALTH

Q Which countries constitute the Commonwealth of Nations

(*Amrik Sing New Delhi*)

Ans The following countries are members —

(1) United Kingdom (2) Canada (3) Australia (4) New Zealand (5) South Africa (6) India (7) Pakistan (8) Ceylon (9) Rhodesia and Nyasaland (10) Malaya (11) Ghana

FOREIGN EXCHANGE

Q Define the term Foreign Exchange Explain the determination of the Rate of Exchange

(*Many Readers*)

Ans The foreign money as seen by the domestic sell r or buyer is defined as foreign Exchange

It is the supply of and demand for foreign money that determines the rate of Exchange just as the market price of commodities is determined by the forces of Suply and De

Q Give an account of the Purchasing Power Parity Theory? Is it a valid theory of Exchange rate Determination? Has the theory any merit? (A P Susheela Ernakulam)

Ans This theory explains the fundamental connection between foreign exchange rates and the levels of costs and prices in the various countries It asserts that, ignoring all capital movements long or short period the rate of Exchange in a completely uncontrolled market will settle automatically at a level where the purchasing power of the two currencies is the same

The theory suffers from many shortcomings Keynes suggested two basic defects of the parity theory (1) It fails to take into account the elasticities of reciprocal demand (2) It fails to consider the influence of capital movements Hence it cannot be regarded as a valid theory

Its only merit as Crowther suggests is that it enables us to make a rough approximation of the Equilibrium Rate of Exchange

COLOMBO PLAN

Q What is Colombo Plan? What is its aim?

(P A R. Chandran Karolbagh New Delhi)

Ans It is a plan launched in 1950 by the British Commonwealth to promote the economic development of the Commonwealth countries in Asia Its scope soon widened and today it includes most of the countries of South Asia The object is to enable the countries to help each other to devise plans for economic advancement

AMBASSADOR AND HIGH COMMISSIONER

Q Mention the distinction between Ambassador and High Commissioner

(C S Rajalakshmi Elamkunnapuzha)

Ans An Ambassador represents his country in the state to which he is accredited An Ambassador of one Commonwealth country to another Commonwealth country is designated as High Commissioner

POET VALLATHOL

Q Which are the important works of the late Vallathol Narayana Menon poet laureate of Kerala? Are the English or Hindi renderings of some of his peoms available?

(Ramkumar Khanna, Chandigarh)

Ans (1) Chitrayoga (2) Sahitya Manjari—8 Volumes (Collections of Poems) (3) Mary of Magdalene (4) Kochu Sita (5) Anirudha in Prison (6) Lament of the Deaf (7) Russia (8) Rig Veda Translation in Malayalam

Some of the above works have been translated into English and Hindi Further details regarding translated works can be had from Sahitya Academy

WORLD OF BOOKS

Q Who wrote the following Books?

(a) East of Home
(b) Prison and Chocalate Cake
(c) The Real Bernard Shaw
(d) Godan
(e) The Financial Expert
(f) Ambassador s Report

(B Raghavan New Delhi)

(g) Megh Doot
(h) Pickwick Papers
(i) Pygmalion

(Satya Narain Sinha, Bihar)

Ans (a) Santha Rama Rau
(b) Nayan Tara Sahgal.
(c) Maurice Coulborne
(d) Premchand
(e) R. K. Narayan
(f) Chester Bowles
(g) Kalidasa
(h) Charles Dickens
(i) Bernard Shaw

GOLDEN AGE

Q 'Golden age is not behind but before us Please comment —Sheodan Singh Butana, Bulandshahr

Ans It all depends on the way in which the term Golden Age is interpreted. On the one hand it may mean an age of unalloyed bliss harmony tranquillity and love We have had such Golden Age in the past But those days are gone, and gone for good. On the other hand we can well conceive of a brand-new Golden Age—an age wherein material progress and scientific development will reach their zenith Such a Golden Age is certainly ahead of us Hence the contention that Golden Age is before us will be valid only if we attribute this meaning to it But this new Golden Age will be awfully lacking in the sweet rich values of life which were the very hallmarks of the Golden Age of the past.

INTRODUCTION TO OUTER SPACE

(A layman s guide to the fascinating subject of the science of outer space was prepared by the U S President s Science Advisory Committee which included eminent American scientists The following extract answers many questions in simple non-technical language which a layman may ask in connection with the subject of outer space exploration)

IT has been the military quest for ultra-long-range rockets that has provided man with new machinery so powerful that it can readily put satellites in orbit, and, before long send instruments out to explore the moon and nearby planets In this way what was at first a purely military enterprise has opened up an exciting era of exploration that few men, even a decade ago dreamed would come true

Why Satellites Stay Up

We all know that the harder you throw a stone the farther it will travel before falling to earth If you could imagine your strength so fantastically multiplied that you could throw a stone at a speed of 15,000 mph it would travel a great distance It would, in fact, easily cross the Atlantic Ocean before the earth s gravity pulled it down Now imagine being able to throw the stone just a little faster say about 18 000 mph what would happen then ?

The stone would again cross the ocean but this time it would travel much farther than it did before It would travel so far that it would overshoot the earth so to speak and keep falling until it was back where it started Since in this imaginary example there is no atmospheric resistance to slow the stone down, it would still be travelling at its original speed 18 000 mph when it had got back to its starting point So around the earth it goes again From the stone s point of view it is continuously falling except that its very slight downward arc exactly matches the curvature of the earth, and so it stays aloft—or as the scientist would say in orbit' —indefinitely

Since the earth has an atomosphere of course neither stones nor satellites can be sent whizzing around the earth at tree-top level Satellites must first be lifted beyond the reach of atmospheric resistance It is absence of atmospheric resistance plus speed that makes the satellite possible It may seem odd that weight or mass has nothing to do with a satellite s orbit If a feather were released from a t n ton satellite the two would stay together following the same path in the airless void There is however a slight vestige of atmosphere even a few hundred miles above the earth and its resistance will cause the feather to spiral inward toward the earth sooner than the satellite. It is the atmospheric resistance however slight, that has set limits on the life of all satellites launched to date Beyond a few hundred miles the remaining trace of atmosphere fades away so rapidly that tomorrow's satellites should stay aloft thousands of years and perhaps indefinitely The higher the satellite, incidentally the less speed it needs to stay in orbit once it gets there (thus the moon s speed is only a little more than 2 000 mph) but to launch a satellite toward a more distant orbit requires a higher initial speed and greater expenditure of energy

The Thrust Into Space

Rocket engineers rate rockets not in horsepower but in thrust Thrust is just another name for push and it is expressed in pounds of force The rocket gets its thrust or push by exhausting material backward It is this thrust that lifts the rocket off the earth and accelerates it, making it move f ster and faster

As everyone knows it is more difficult to accelerate an automobile than a baby carriage To place satellites weighing 1 000 to 2 000 pounds in orbit requires a first stage rocket engine or engines having a thrust in the neighbourhood of 200 000 to 400 000 pounds

For launching a satellite or other space vehicle the rocket engineer divides his rocket into two three or more stages which can be dropped one after the other in flight thus reducing the total weight that must be accelerated to the final velocity desired. (In other words it is a great waste of energy to lift one huge fuel tank into orbit when the tank can be divided into smaller tanks—each packaged in its own stage with its own rocket motor—that can be left behind as they become empty)

To launch some of the present satellites has required rockets weighing up to 1 000 times the weight of the satellite itself But it will be possible to reduce take off weights until they are only 50 to 100 times that of the satellite The rocket s high ratio of gross weight to payload follows from a fundamental

limitation in the exhaust velocities that can be achieved by chemical propellants

If we want to send up not a satellite but a device that will reach the moon we need a larger rocket relative to its payload in order that the final stage can be accelerated to about 25 000 mph. This speed called the "escape velocity" is the speed with which a projectile must be thrown to escape altogether from the gravitational pull of the earth. If a rocket fired at the moon is to use as little fuel as possible it must attain the escape velocity very near the beginning of its trip. After this peak speed is reached the rocket will be gradually slowed down by the earth's pull but it will still move fast enough to reach the moon in two or three days

The Moon As A Goal

Moon exploration will involve three distinct levels of difficulty. The first would be a simple shot at the moon ending either in a hard landing or a circling of the moon. Next in difficulty would be a soft landing. And most difficult of all would be a soft landing followed by a safe return to earth

The payload for a simple moon shot might be a small instrument carrier similar to a satellite. For the more difficult soft landing the carrier would have to include as part of its payload a retro-rocket (a decelerating rocket) to provide braking action since the moon has no atmosphere that could serve as a cushion

To carry out the most difficult feat a round trip to the moon, will require that the initial payload includes not only retrorockets but rockets to take off again from the moon. Equipment will also be required aboard to get the payload through the atmosphere and safely back to earth. To land a man on the moon and get him safely again will require a very big rocket engine indeed—one with a thrust in the neighbourhood of one million pounds. While nuclear power may prove superior to chemical fuels in engines of multi million pound thrust even the atom will provide no short cut to space exploration

Sending a small instrument carrier to Mars, although not requiring much more initial propulsion than a simple moon shot would take a much longer travel time (eight months or more) and the problems of navigation and final guidance are formidable

A Message From Mars

Fortunately, the exploration of the moon and nearby planets need not be held up by lack of rocket engines big enough to send men and instrument carriers out into space and home again. Much that scientists want to learn from satellites and space voyages in the solar sysetm can be gathered by instruments and transmitted back to earth. The transmission it turns out is relatively easy with today's rugged and tiny electronic equipment

For example a transmitter with a power of just one or two watts can convey radio information from the moon to the earth. And messages from Mars on the average some 50 million to 100 million miles away at the time the rocket would arrive can be transmitted to earth with less power than that used by most commercial broadcasting stations. In some ways indeed it appears that it will be easier to send a clear radio message between Mars and Earth than between New York and Tokyo

This all leads up to an important point about space exploration. The cost of transporting men and material through space will be extremely high but the cost and difficulty of sending information through space will be comparatively low

The View From Satellite

Here are some of the things that scientists say can be done with the new satellites and other space mechanisms. A satellite in orbit can do three things (1) it can sample the strange new environment through which it moves (2) it can look down and see the earth as it has never been seen before and (3) it can look out into the universe and record information that can never reach the earth's surface because of the intervening atmosphere

The satellite's immediate environment at the edge of space is empty only by earthly standards. Actually empty space is rich in energy radiation and fast moving particles of great variety. Here we will be exploring the active medium a kind of electrified plasma dominated by the sun, through which our earth moves. Scientists have indirect evidence that there are vast systems of magnetic fields and electric currents that are connected somehow with the outward flow of charged material from the sun. These fields and currents the satellites will be able to measure for the first time. Also for the first time the satellites will give us a detailed three-dimensional picture of the earth's gravity and its magnetic field

Physicists are anxious to run one crucial and fairly simple gravity experiment as soon as possible This experiment will test an important prediction made by Einstein's General Theory of Relativity namely, that a clock will run faster as the gravitational field around it is reduced. If one of the fantastically accurate clocks using atomic frequencies were placed in a satellite and should run faster than its counterpart on earth another of Einstein's great and daring predictions would be confirmed (This is not the same as the prediction that any moving clock will appear to a stationary observer to lose time — a prediction that physicists already regard as well confirmed)

There are also some special questions about cosmic rays which can be settled only by detecting the rays before they shatter themselves against the earth's atmosphere And, of course, animals carried in satellites will begin to answer the question what is the effect of weightlessness on physiological and psychological functions? (Gravity is not felt inside a satellite because the earth's pull is precisely balanced by centrifugal force This is just another way of saying that bodies inside a satellite behave exactly as they would inside a freely falling elevator)

The satellite that will turn its attention downward holds great promise for meteorology and the eventual improvement of weather forecasting Present weather stations on land and sea can keep only about ten per cent of the atmosphere under surveillance Two or three weather satellites could make a cloud inventory of whole globe every few hours From this inventory meteorologists believe they could spot large storms (including hurricanes) in their early stages and chart their direction of movement with much more accuracy than at present Other instruments in the satellites will measure for the first time how much solar energy is falling upon the earth's atmosphere and how much is reflected and radiated back into space by clouds oceans the continents and by the great polar ice fields

It is not generally appreciated that the earth has to send back into space over the long run exactly as much heat energy as it receives from the sun If this were not so the earth would either heat up or cool off But there is an excess of income over outgo in the tropical regions and an excess of outgo over income in the polar regions This imbalance has to be continuously rectified by the activity of the earth's atmosphere which we call weather

By looking at the atmosphere from the outside, satellites will provide the first real accounting of the energy imbalances, and their consequent tensions all around the globe With the insight gained from such studies, meteorolgists hope they may improve long range forecasting of world weather trends

Finally there are the satellites that will look not just around or down but out into space Carrying ordinary telescopes as well as special instruments for recording X-rays ultraviolet and other radiations these satellites cannot fail to reveal new sights forever hidden from observers who are bound to the earth What these sights will be no one can tell But scientists know that a large part of all stellar radiation lies in the ultraviolet region the spectrum and this is totally blocked by the earth's atmosphere Also blocked are other very long wave lengths of 'light' of the kind usually referred to as radio waves Some of these get through the so called 'radio window' in the atmosphere and can be detected by radio telescopes but scientists would like a look at the still longer waves that cannot penetrate to earth

Even those light signals that now reach the earth can be recorded with brilliant new clarity by satellite telescopes All existing photographs of the moon and nearby planets are smeared by the same turbulence of the atmosphere that makes the stars twinkle Up above the atmosphere the twinkling will stop and we should be able to see for the first time what Mars really looks like And we shall want a really sharp view before launching the first rocket to Mars

A Close-Up of the Moon

While these satellite observations are in progress other rockets will be striking out from the moon with other kinds of instruments Photographs of the back or hidden side of the moon may prove quite unexciting or they may reveal some spectacular new feature now unguessed Of greater scientific interest is the question whether or not the moon has a magnetic field Since no one knows for sure why the earth has such a field the presence or absence of one on the moon should throw some light on the mystery

But what scientists would most like to learn from a close up study of the moon is something of its origin and history Was it originally molten? Does it now have a fluid core similar to the earth's? And just what is the nature of the lunar surface? The answer to these and many other questions

should shed light, directly or indirectly on the origin and history of the earth and the surrounding solar system

While the moon is believed to be devoid of life even the simplest and most primitive this cannot be taken for granted Some scientists have suggested that small particles with the properties of life—germs or spores—could exist in space and could have drifted on to the moon If we are to test this intriguing *hypothesis* we *must* be *careful* not to contaminate the moon's surface in the biological sense, beforehand There are strong scientific reasons too for avoiding radioactive contamination of the moon until its naturally acquired radioactivity can be measured

And on to Mars

The nearest planets to earth are Mars and Venus We know quite enough about Mars to suspect that it may support some form of life. To land instrument carriers on Mars and Venus will be easier in one respect than achieving a soft landing on the moon The reason is that both planets have atmospheres that can be used to cushion the final approach These atmospheres might also be used to support balloons equipped to carry out both meteorological sound and general photo survey of surface features The Venusian atmosphere, of course, consists of what appears to be a dense layer of clouds so that its surface has never been seen at all from earth.

Remotely controlled scientific expeditions to the moon and nearby planets could absorb the energies of scientists for many decades Since man is such an adventurous creature *there will undoubtedly come a time when* he can no longer resist going out and seeing for himself It would be foolish to try to predict today just when the moment will arrive. It might not arrive in this century or it might come within one or two decades

The Satellite Radio Network

Meanwhile back at earth satellites will be entering into the everyday affairs of men Not only will they be aiding the meteorologists, but they could surely—and rather quickly—be pressed into service for expanding world wide communications including intercontinental television

At present all trans oceanic communication is by cable (which is costly to install) or by shortwave radio (which is easily disrupted by solar storms). Television cannot practically be beamed more than a few hundred miles because the wavelengths needed to carry it will not bend around the earth and will not bounce off the region of the atmosphere known as the ionosphere. To solve this knotty problem satellites may be the thing for they can serve as high flying radio relay stations. Several suitably equipped and properly spaced satellites would be able to receive TV signals from any point on the globe and to relay them directly – or perhaps via a second satellite—to any other point. *Powered with solar batteries,* these relay stations in space should be able to keep working for many years

Military Applications of Space Technology

There are important foreseeable military uses for space vehicles These lie broadly speaking in the fields of communication and reconnaissance To this we could add meteorology for the possible advances in meteorological science which have already been described would have military implications The use of satellites for radio relay links has also been described and it does not take much imagination to foresee uses of such techniques in long range military operations

The reconnaissance capabilities of a satellite are due of course to its position high above the earth and the fact that its orbit carries it in a predictable way over much of the globe. Its disadvantage is its necessarily great distance, 200 miles or more, from the surface A highly magnifying camera or telescope is needed to picture the earth's surface in even moderate detail To the human eye from 200 miles away, a football stadium would be a barely distinguishable speck A telescope camera can do a good deal better depending on its size and complexity It is certainly feasible to obtain reconnaissance information with a *fairly* elaborate instrument information which could be relayed back to the earth by radio

Much has been written about space as a future theatre of war raising such suggestions as satellite bombers military bases on the moon and so on For the most part, even the more sober proposals do not hold up well on close examination or appear to be achievable at an early date Granted that they will become technologically possible, most of the schemes nevertheless appear to be clumsy and ineffective ways of doing a job. Take one example the satellite as a bomb carrier A satellite cannot simply drop a bomb An object released from a satellite doesn't fall So there is no special advantage in being over the

STUDENTS' EMPORIUM

READING HABITS OF STUDENTS

Mr K G Saiyidain, Educational Adviser Government of India, stated in New Delhi on May 5, that "the mental vacuity, the poverty of general knowledge, the lack of general interests in students against which our educationists have been bewailing is due, in a large measure to the fact that at home as well as in schools they miss the refining influence of good books

He was addressing a national conference on reading at Vigyan Bhavan

Pedagogues from all parts of India were meeting to take stock of the persistent and appalling failure of the present educational system to develop the taste for discriminating reading amongst the student population in particular, leading to a general fall in our academic standards Opinion was unanimous that the art of reading has passed into disuse

Mr Saiyidain urged ' If these indignant lamentations of educationsists and public men are to be anything more than a kind of emotional release measures must be devised on a nation wide scale, to create an abiding and healthy interest in reading to develop proper skills and techniques of study and to produce the right type of literature to feed this interest

He repudiated the charge that the present day generation of children were not interested in books or reading The bulk of the children were readily responsive to books and we should release the children s impulse to read for enjoyment and pleasure and not worry our selves unduly about the quality or didactic value of the reading material

Thrillers sex, crime and murder stories had indeed made the people incapable of responding to the thrill of great literature Mr Saiyidain appealed to teachers to constantly strive to improve the standard and quality of students reading habits and to refine, deepen and broaden reading interests so that literature of good quality would make its appeal to them. ' In our schools and colleges if we are unable to build a bridge between juvenile interests adolescent and the adult our education has failed in one of its important objectives ' he added

Proceeding Mr Saiyidain said that reading was still a greatly under-developed art both at the level of children and adults The library services in the country have not yet been developed adequately He referred to the steps taken by the Government to foster production of good literature for children and adults The library movement was being built up at the State, regional, district and village level and if this was to serve a useful purpose reading must be envisaged as a continuous activity from childhood through adolescence to adult hood

Mr Saiyidain said that India was not yet a nation of readers and the people s tradition al respect for books and knowledge had to be translated into the love of reading for profit and pleasure Investment in books and libraries was not a luxury but an inevitable feature of all good education He appealed for co-operative and concerted efforts to break down this inertia

* * *

TEN BEST BOOKS

In reply to a correspondent s question as to which are the ' ten most significant books from the ancient times to the modern period the *Booklover* (a magazine published by India Book House Bombay) listed the following 25 books

The *Bible* Homer s *The Iliad* and *the Odyssey* Plato s *Republic* *The Arabian Nights* Cervantes *Don Quixote* Montaigne s *Essays* Shakespeare s *Plays And Poetry* Henry Fielding s *Tom Jones* Benjamin Franklin s *Autobiography* Voltaire s *Candide* Darwin s *Origin of Species* Dostoevsky s *Crime And Punishment* Emerson s *Essays* Gustave Flaubert s *Madame Bovary* Karl Marx s *Das Kapital* Guy de Maupassant s *Short Stories* Herman Melville s *Moby Dick* Stendhal s *The Red And The Black*; Leo Tolstoy s *War And Peace* Walt Whitman s *Leaves Of Grass* Theodore Dreiser's *An American Tragedy* James Joyce s

Wrath Ernest Hemingway's *A Farewell To Arms* and Thomas Wolfe's *Look Homeward Angel*

• • • •

BEST PLAYS OF SEASON

"Look Homeward Angel' Ketti Frings (adaptation of Thomas Wolfe's autobiographical novel has won the Drama Critics Circle Award as the best American play of the season

The moving drama of North Carolina life in 1916 came out on top in its division by the margin of 15 votes of the total of 19 cast Runners up were William Inge's The Dark at the Top of the Stairs and William Saroyan's "The Cave Dwellers

Voted the best musical of the year was 'The Music Man which received ten votes while eight were cast for West Side Story

Winning the best foreign play was John Osborne's Look Back In Anger a drama about Britain's angry young men It received 13 votes against the three cast for "The Entertainers starring Laurence Olivier

The Drama Critics Circle is made up of reviewers representing New York newspapers, news agencies and magazines

ADVICE TO STUDENTS

An educator's advice to his students

Get your grammar right and all other needful things will fall to you

Live in the active voice not the passive Think more about what you make happen than about what happens to you

Live in the indicative mood rather than the subjunctive Be concerned with things as they are, rather than as they might be

Live in the present tense facing the duty at hand without regret for the past or worry over the future

Live in the first person criticizing yourself rather than finding fault with others

Live in the singular number caring more for the approval of your own conscience than for the applause of the crowd

And if you want a verb to conjugate you cannot do better than to take the verb to love"

—*William DeWitt Hyde*

CHOOSING A VOCATION

Realising the importance of proper vocation [illegible] the [illegible]

opened a Vocational Guidance Bureau in Bombay in 1950 Four years later the Central Government set up the Central Bureau in Delhi and offered financial assistance to the States to open theirs

Major Activities As part of the State's Second Five-Year Plan the Vocational Guidance Bureau in Bombay was converted into the Institute of Vocational Guidance and two Sub-Bureaux were opened in Poona and Ahmedabad There are three major activities of the Institute dissemination of occupational information aptitude testing and training of teachers Information relating to training facilities and qualifications for jobs is disseminated in such various ways as attendance given to those calling personally through queries answered by post by means of publications, radio talks press articles and career conferences.

Aptitude testing is another important activity Besides measuring the aptitudes of the individuals referred to the institute by schools, hospitals and social welfare agencies extensive use of aptitude tests is made for selection purposes Contrary to what is generally believed the results of aptitude tests are not the only factors taken into account when helping a boy to choose his future career Generally speaking the following seven factors are usually considered the boy's previous achievements his general intelligence, special abilities or aptitudes his likes and dislikes physical condition temperamental qualities and other circumstances like economic conditions and availablity of training facilities

Training for Teachers In order that guidance may eventually reach every boy and girl in the State the Institute along with other agencies has been engaged in training teachers for this work A number of schools now have on their staff trained career masters whose job

---

(*Continued from page 462*)

target Indeed the only way to "drop" a bomb directly down from a satellite is to carry out aboard the satellite a rocket launching of the magnitude required for an intercontinental missile A better scheme is to give the weapon to be launched from the satellite a small push, after which it will spiral in gradually But that means launching it from a moving platform halfway around the world with every disadvantage compared to a missile base on the ground In short the earth would appear to be after all the best weapons carrier

it is to disseminate occupational information among the pupils they are continuously kept in touch with the latest developments by means of a bi monthly news letter and other means A beginning has also been made in training teachers in aptitude testing and counselling

The guidance movement in India is young but remarkable progress has been made in the field in the last few years The recent conversion of many academic secondary schools into multi purpose schools has given a great impetus to the movement for wherever a choice is offered the need for guidance arises

Facilities for guidance are now available in Delhi as well as in many other States

In Bombay State addresses of Government agencies are —

1 Institute of Vocational Guidance 3, Cruickshank Road Bombay 1
2 Vocational Guidance Sub-Bureau c/o Tilak College of Education Poona 2
3 Vocational Guidance Sub Bureau c/o A G Teachers College, Navrang pura, Ahmedabad 9

The addresses of other Government Bureaux are

1 Central Bureau of Educational and Vocational Guidance 33 Probyn Road Delhi 8
2. State Bureau of Educational and Vocational Guidance Radhanath Training College Cuttack 2 (Orissa)
3 Bureau of Educational Psychological Research David Hare Training College, Calcutta (West Bengal)
4 Bureau of Psychology Allahabad (U P)
5 State Bureau of Educational Guidance, S P Varma Road Patna 1 (Bihar)
6 State Bureau of Education and Vocational Guidance Rajahmundry (Andhra Predesh)
7 State Bureau of Educational and Vocational Guidance Prantiya Shikshan Mahavidyalaya Jabalpur (M P)
8 State Bureau of Educational and Vocational Guidance Department of Education, Gwalior (M. P)

GUIDE TO CAREERS

The Telecommunication Engineer

Telecommunication Engineering is concerned with the transmission of messages information etc., between different places far or near either with the help of wires or without them (wireless) Main cities and towns are connected for transmission of messages either by overhead lines or underground cables or by wireless This branch of engineering is very wide and includes telegraphs teleprinters broadcasting (both sound and picture) radar, radio sound and other allied techniques Its industrial applications include electronic computors, electronic microscopes industrial television *etc* As the nature and scope of the work of a telecommunication engineer is varied specialisation in one of the above branches is essential There are, however, two broad categories those dealing with wire transmission systems are known as Line Communication Engineers and those dealing with wireless as Radio Communication Engineers

A Telecommunication Engineer s Work is to design install operate and maintain a telecommunication system In India the telecommunication system for the transmission of telegraph and telephone messages being the monopoly of the State and under the charge of the Posts and Telegraphs Department the work of a Line Communication Engineer (telephone or telegraph engineer) comprises installation supervision and maintenance of telephone exchanges and telephone lines connecting different exchanges either with each other or with individual subscribers within a city or between cities or even countries The work of planning and interconnecting telegraph offices by wires or by voice frequency carrier system is also his responsibility For this purpose schemes for the expansion of existing communication lines the installation of new exchanges equipment and connections are initiated and planned, blue prints estimates calculations *etc*, are prepared by the technical staff under his supervision and instructions After the schemes are sanctioned instructions verbal as well as in writing are issued to subordinate supervisors and staff for the execution of the work and the site is frequently visited to ensure speedy progress and proper execution On completion the work is finally inspected and checked and the report submitted to higher authorities

For the proper maintenance of line communication systems frequent tours of inspection are undertaken Appropriate instructions are issued when necessary to engineering supervisors linesmen *etc*; for their repair In case of breakdowns speedy restoration of connections is ensured

The work of a Radio Communication

Engineer in an executive department such as the All India Radio is to design install maintain and periodically test broadcasting studios transmitters and receiving centres Suitable sites or buildings are surveyed and selected and the construction (o alteration) of transmitting stations studios *etc* is planned and supervised The machinery and equipment is then assembled installed and tested operators and technicians are instructed in the maintenance and operation of the equipment and their work is planned coordinated and supervised In case of break downs stoppages *etc* repairs and restoration is arranged for

For a Radio Communication Engineer employed in industry, the work comprises designing manufacture and testing of broadcasting equipment such as radio and television receivers transmitters amplifiers studio equipment recording equipment *etc* In aviation and Defence S rvices the work is of a somewhat similar nature *viz* installation *operation and maintenance of wireless com* munication equipment In this field the role played by him is very vital as many lives depend on the accuracy and skill of his performance

Telecommunication engineers are also required to maintain communications between land stations and ships at sea or aircraft in flight and also to install and maintain special wireless transmitting and receiving stations m ant for the transmission of overseas messages by radio telephony or telegraphy

Irrespective of th fielde of work some administrative duties, connected with the installation and operation of the equipment are g nerally performed and establishment matters (such as leave administration discipline of the staff) proper storage of equipment and materials certification and disbursement of payments *etc*, are attended to

Telecommunication engineer s work is both in the office and in the field sometimes amidst noise and confusion Much of the work pertaining to designing planning administration maintenance and operation is indoors while that pertaining to installation inspection and construction is outdoors Working hours are normally regular but those employed in radio-stations may have to attend duty in the mornings or late evenings

Personal Qualities necessary for the job are liking for and pronounced ability in mathe atic and physics organisational and executive ability and patience persistence and accuracy in execution For administrative posts executive ability is equally essential

To Qualify one has to take a degree or a diploma course in telecommunication or electrical engineering with radio communication as a special subject

Four year degree courses in telecommunication engineering are offered by the Government *Engineering College Jabalpore the* Engineering College Guindy Madras the Engineering College Poona and the Birla College, of Engineering Pilani The minimum qualification for admission is Intermediate science with physics chemistry and mathematics

Degree holders in science (physics and mathematics) or electrical engineering can also take up a three year diploma course (one years for graduates in electrical engneering) in telecommunication engineering at the Indian Institute of Science Bangalore and the Indian Institute of Technology, Kharagpur

Holders of a degree (preferably Honours or Master's degree) in physics or mathematics or with wireless as a special subject or a diploma in wireless and possessing adequate experience (2 to 5 years) in telecommunications are also considered qualified for many posts (such as assistant engineer) in the field D gree courses in physics and mathematics are offered by all Indian Universities

Information on training facilities in electrical engineering is given in 'Guide to Careers on the 'Electrical Engineer', and information on diploma courses in wireless in the pamphlet on the Radio Technician

The Cost Of Training is Rs 15/ to Rs 25/ per month as tuition fee in addition to living expenses varying between Rs 80/ and Rs 120/ per month

Short Duration Courses of 6½ months in communication engineering available at the Civil Aviation Training Centre Allahabad are open to degree/diploma holders in telecommunication or electrical engineering The Posts and Telegraphs Department offers 10 weeks short term and one years long term training facilities to students of various colleges in its District Telephone Offices at New Delhi Madras Bombay Nagpur Calcutta and Lucknow and in its workshops at Alipore Bombay and Jabalpore Degree and Diploma holders in telecommunication or electrical engineering may take practical train

ing for three months at the Overseas Communication Service Centre Bombay The Indian Telephone Industries Bangalore, accept a limited number of degree/diploma holders in electrical or communications engineering for 2 to 3 years training in their workshop with a view to employ them in their design and production departments During training a stipend of Rs 45/ to Rs 100/ per month in addition to dearness allowance is paid to the trainees Some private manufacturing companies like Philips Eastern Electronics (Faizabad) Radar & Electrical Manufacturing Co (Bangalore) also offer facilities for training to qualified tele communication/electrical engineers

Further Training leads to a Master s degree courses for which are offered by the Government Engineering College Jabalpore and the *Indian Institution of Technology* Kharagpur Post graduate courses in radio engineering telephone engineering advanced electronics and research facilities leading to the award of a doctorate (Ph D) are also available at the Government Engineering College Jabalpore

The Institution of Telecommunication Engineers P B No 481 New Delhi accepts graduates in telecommunication engineering for enrolment as Graduates of the Institution Graduates who have rendered important service to telecommunication engineering are eligible for Associateship while Graduates with five years experience in telecommunication/electrical engineering are eligible for Associate Membership On completion of at least six years experience Associate Members can be enrolled as Members and on election by the Council can become Fellows of the Institution. The Institution also conducts Studentship and Graduateship examinations The Graduateship examination is likely to be recognised as equivalent to degree in telecommunication engineering

Openings exist under the Ministries of Communications (the Wireless Planning and Coordination Office the Posts and Telegraphs Department the Overseas Communication Service the Civil Aviation the Police Intelligence Department) Information and Broadcasting (All India Radio) Defence (the Air Force the Navy and the Army —Signals and Intelligence) Transport (the Railways) under Government industrial establishments (Indian Telephone Industries Bangalore Hindustan Cables Ltd Bangalore Electronics Research Laboratory Pilani) under manufacturing *industries* (Bharat Electronics, Bangalore, Automatic Telephone Company, Bangalore, Radar and Electrical Manufacturing Company Bangalore Eastern Electronics Faizabad Philips Radio Company, National Ecko Radio Manufacturing Company *etc*) and under the mercantile marine

Entry into the profession for non gazetted jobs is by selection in response to advertisements or through Employment Exchanges Gazetted posts are filled through the Union Public Service Commission New Delhi For employment in the Defence Services *recruitment is done by the Union Public* Service Commission on the basis of a competitive examination conducted by them and the Services Selection Boards f the Army and the Air Force Age limits are 20-27 years for the Army and 18 28 years for the Indian Air Force Engineering graduates between 20 25 years of age can appear in the combined competitive examination conducted by the Union Public Service Commission *New Delhi for appointment to Central* Engineering Services (Telegraph Engineering Service the Indian Railway Service of Engineers *etc*) The date and venue of the examination are notified in the principal papers of the country

Recruitment to the Engineering Supervisors cadre in the Post and Telegraphs department from outsiders is done by inviting applications from candidates who have passed the Intermediate Examination in Mathematics and Physics and by selecting the candidates on the basis of marks obtained in the *Intermediate Examination After* selection candidates are given 12 months training in the Department before being absorbed in the cadre Engineering Supervisors are eligible for appearing in a departmental examination for promotion to Telegraph Engineering (Wireless) Service Class II after completing 5 years of service

Prospects for Advancement are to senior posts usual y within the department as most of the openings are available in Government offices or Government-owned or controlled factories

Employment Outlook With the increasing use of electricity in communications the sphere and scope of tele communication engineering has vastly increased During the coming years communication facilities are likely to make considerable progress It is expected that by 1961, all important tehsils and towns

LETTERS to the EDITOR

Letters from the readers giving their own opinion or point of view on all interesting subjects are published in these columns. Letters should be brief to the point, neatly typed double space. They may be written under a pseudonym, but must be accompanied by writer's name and address. The views expressed here do not necessarily reflect editorial opinion or policy

PURPOSE OF EDUCATION

Sir

The aim of an Ideal Welfare State is not wealth absolute equality or mere peace and order. Its aim is the realization of good life so that in it the individual may enjoy the fullness of his life to his best capacity. Education in such a state is instrumental to good life a life of happiness and virtue

The good life consists of three things (i) Material (ii) Physical and (3) Intellectual. Education must help man in earning his livelihood, must see that he possesses good health and must impart to him an intellectual training

In a Welfare State the purpose of education is the harmonious development of the individual with a view to his having a proper place in social and political life. Without education a life of virtue and happiness is impossible, and the aim will ever remain imaginary

Thought is the spring of happiness and the educated who has been trained how to utilise leisure and live a life of thought, knows how to live life of happiness. Education is an essential condition of happiness and life.

Another aim of education is to help making the citizens law-abiding. Education is the main weapon at the disposal of the State for the maintenance of a code of social ethics and political principles which the combined efforts of the community seek to serve

Education has not only a political aim it has also a social aim. Man is a combination of the beast and the God of desire and reason. When perfected by education his social and political nature gets its fulfilment. But when he suffers from credulity and doubts he is the worst of devils

The system of education must so train men the art of living that a unity can be achieved amidst manyfold diversities. A State is a union without unification, an agreement within differences. It is the task of the education to see that individuality of man does not pervert into individualism and that unity and diversity are fairly balanced

Education is a training in the general art of citizenship. Citizen is one who participates actively in the affairs of the State. He is required to know how to command and how to obey. The aim of education must be to make man fit to be both a good ruler and an obedient subject

In short the task of education is to teach men how to lead a life of peace and leisure at the same time making them temperate brave and capable of endurance

Uneducated citizens are a liability to the State. Uneducated children will not become able to actualise their moral and intellectual potentialies. There should not be separate schemes of education for different classes but there should be single scheme for everyone. It is the duty of the State to provide a free universal and compulsory education to all its citizens

Kanpur — Yours etc.

PEACE OF MIND

Sir,

Every man is trying his best to acquire peace of mind, but very few in this world are fortunate to enjoy it. Everything which any person does he does for the peace and the solace of his mind although through his imprudence or foolishness he may not get it. It is the aim of all of us but possession of very few

Naturally the question arises 'What is the source of peace and happiness? Most of us try to seek them from riches laurels grand edifices, clubs cinemas and hundred

and one suchlike worldly things Had peace been there those who can afford to provide these things would be the owners of this treasure but in practice we see that those who indulged in the said illusive pleasures are rather unhappy and uncontented in their minds What a strange thing happiness is greater than all the great treasures Providence has laid this most valuable blessing open to all The man who has peace of mind has the best of the world and one deprived of it has trash despite numerous luxuries which rather bring sorrow and gloom to the mind Without a peaceful and calm mind a man s life can be compared to a flower without smell People are not satisfied with themselves for they do not do their work properly and do not perform their duty diligently The happiest man in the world is one who does his day s work to his entire satisfaction Ever increasing desires for self gratification and temporary enjoyments mar our peace of mind Let our own minds be kingdoms to us and produce such a peaceful and happy atmosphere around us that we may always say ' That is right therein lies true happiness It is a thing worth trying and can be sought by practice It is a good aim to be pursued in our lives and is sure to lead us to success and happines Let us therefore be always of optimistic view and put ourselves to our duty with heart and soul We should cease-worrying about the future "One must not worry about the results of one s actions in life if he has put his whole heart and energy into it says Lord Krishna in *Gita*

Pirsulubi (Kangra) Yours etc

NATIONAL LANGUAGE OF INDIA

Sir,

Controversy over the national language of India has been going on for a very considerable period without the least sign of any fruit ful solution I am unable to agree with the view that History stands witness that no nation has progressed by fostering a foreign language This is a fallacious argument which fails to stand the test of scrutiny Every student of History knows it well that the present all round economic social cultural and educational progress of Japan is mainly due to the introduction of English as a compul sory subject both in the school and the university curricula

Then comes the question of national unity But does national unity always depend on language alone ? Definitely not, so far as Indian unity is concerned Despite the existence of diverse languages and nationalities and territorial differences India was is and will be a Nation Furthermore English as an all India medium of expression has done immense service to the cause of Indian unity So the forcible introduction of Hindi as an instrument of unity will not only falsify the wishes of its introducers but also create a widening gulf between the different states and its peoples and accentuate segregation It is an agreed truth that India offers unity in diversity So 'mere autocratic dictation , says Dr Jadunath Sarkar the mere drawing of the administrative road roller over the rough surface of the people s head cannot grind them into true uniformity at least such uniformity is not natural, and so cannot last long ' So the arbitrary introduction of Hindi against the wishes of the absolute majority of India is definitely over sentimentalism' 'fanaticism and at the same time deviation from realism and hence not true nationalism but perverted nationalism or jingoism which is a serious thing and should safely be avoided This jingoism of the German Nazis is the cause of their present sorry plight Shall we welcome that evil spirit ?

The statement that Hindi is the language of the common people in India is a falsification of the truth a mere eye wash to hood wink the public opinion Hindi is the lingua franca of the people of U P , M.P and Rajas than only It is Greek to the Deccanies This is the statistical finding of the language commission English should be retained at any cost for an indefinite period of time and if that is not possible both Hindi and English I think this will be better

TRAINED TEACHERS

Dear Sir

I fully endorse the view expressed by Gurdev Singh in his letter appearing under the above caption in your April issue There are 23 training colleges in Punjab with a normal strength of 120 in each college They are turning out 3000 trained graduates every year It is difficult for them to get employment after passing the examination Some of the teachers are working on Rs 100 P M in private schools The Punjab University should better close the ill staffed colleges Only then there is any possibility of reducing unemployment

Yours etc
Rohtak Prof S S Jaswal.

'Jungle Saga'

A record of an ancient Indian culture which may soon disappear completely is depicted in the new Swedish colour film 'A Jungle Saga made by Sweden's documentary producer Arne Sucksdorff The film, which took three years to make describes life among the people of the Muria tribe in Central India

It is of particular interest as modern industry and communications are encroaching on the isoloted Muria people and the original character of their ancient community may soon be lost for ever

• • • •

Russia to make 300 Science Films

Three Hundred documentaries and science fiction films will be made in the U S S R. this year about the achievements of Soviet and world science in the development of artificial earth satellites rocketry the peaceful uses of atomic energy and other subjects

One of them, 'Automations in Cosmic Space" will include sequences showing the globe from the height of several score kilometres This film which is being produced by the Moscow Science Fiction Studio will deal with the uses of rockets for scientific research

Unique "shorts will be included in the film 'Cosmic Medicine, about a new branch of science studying the effect of conditions in cosmic space on living organisms

Special films will be made about the atomic icebreaker 'Lenin the Joint Nuclear Research Institute in Dubna near Moscow and the uses of radio active isotopes in industry, geology and agriculture
